The `bgp route-reflector preserve-attributes` command configures the switch as a BGP route reflector. By default, BGP route reflector is disabled.

The `no bgp route-reflector preserve-attributes` and `default bgp route-reflector preserve-attributes` commands disable BGP route reflector on the switch.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
bgp route-reflector preserve-attributes [always]
no bgp route-reflector preserve-attributes [always]
default bgp route-reflector preserve-attributes [always]
```

**Parameter**

- `always` Always preserve route attributes, overwriting route map changes.

**Example**

- The following commands configure the switch as BGP route reflector.

```
switch(config)#router bgp 10
switch(config-router-bgp)#bgp route-reflector preserve-attributes always
switch(config-router-bgp)#
```
14.5.4.26  clear bgp history

To clear all messages for a peer or group of peers, use the `clear bgp history` command.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear bgp [ PEER | PREFIX | peer-group PEER_GROUP ] history [connect-failures] [vrf VRF]
```

**Parameters**
- **PEER** An IPv4 or IPv6 valid address.
- **PREFIX** An IPv4 or IPv6 valid prefix.
- **peer-group PEER_GROUP** A peer group name.
- **connect-failures** Optional and will not affect the result.
- **vrf VRF** A VRF name. If it's not supplied, command will act upon VRF default.

If no peer, prefix, or peer-group is supplied, the `clear bgp history` command will clear the history for all peers in the specified VRF.

**Related Command**
```
show bgp neighbors history
```

**Example**
This example clears the BGP Peer group *Purple* history from *VRF_1*.

```
switch#clear bgp Purple history vrf VRF_1
```
14.5.4.27 clear ip bgp counters

The `clear ip bgp counters` command resets general statistics of peers. These statistics primarily consist of message-related counts.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip bgp [PEERS] counters [VRF_INSTANCES]
```

**Parameters**
- PEERS specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- VRF_INSTANCES specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**
- `clear ip bgp`
- `clear ip bgp errors`
- `clear ip bgp neighbor *`

**Example**
- This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ip bgp counters
! Clearing all IPv4 and IPv6 peering sessions
switch#
```
14.5.4.28  clear ip bgp errors

The `clear ip bgp errors` command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip bgp [PEERS] errors [VRF_INSTANCES]
```

**Parameters**
- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**
- `clear ip bgp`
- `clear ip bgp counters`
- `clear ip bgp neighbor *`

**Example**
- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ip bgp errors
! Clearing all IPv4 and IPv6 peering sessions
switch#
```
14.5.4.29  clear ip bgp neighbor *

The clear ip bgp neighbor * command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv6 transport address family, use the clear ipv6 bgp neighbor * command.

Command Mode
Privileged EXEC

Command Syntax
clear ip bgp neighbor * [VRF_INSTANCE] [ROUTER-ID]

Parameters

- VRF_INSTANCE specifies VRF instance for which IPv4 transport address family BGP neighbors will be cleared. Options include:
  - <no parameter> clears IPv4 BGP neighbors in the context-active VRF.
  - vrf vrf_name clears IPv4 BGP neighbors in the specified VRF.
  - vrf all clears IPv4 BGP neighbors in the all VRFs.
  - vrf default clears IPv4 BGP neighbors in the default VRF.
- ROUTER-ID Router ID as part of peer identifier.

Related Commands

- clear ip bgp
- clear ip bgp counters
- clear ip bgp errors

Examples

- This command clears all IPv4 BGP neighbors in the context-active VRF.
  ```
  switch#clear ip bgp neighbor *
  switch#
  ```

- This command clears all IPv4 BGP neighbors in VRF “purple.”
  ```
  switch#clear ip bgp neighbor * vrf purple
  switch#
  ```

- This command clears the peer IP address (Note, this command is effective only if you specify the router-ID).
  ```
  switch#clear ip bgp neighbor 1.0.0.2 router-id 1.1.1.2 soft
  ```
The `clear ip bgp` command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear ip bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]
```

**Parameters**
- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - `<no parameters>` performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - `soft` performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - `<no parameters>` resets inbound and outbound routes.
  - `in` resets inbound peer routes.
  - `out` resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**
- `clear ip bgp counters`
- `clear ip bgp errors`
- `clear ip bgp neighbor *`

**Guidelines**
Use the `clear ip bgp` command after changing any of the following BGP attributes:
- weights
- distribution lists
- timers
- administrative distance

**Examples**
• This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ip bgp
switch#
```

• This command has the same behavior as the above `clear ip bgp` command.

```
switch# clear ip bgp *
switch#
```
14.5.4.31 clear ipv6 bgp counters

The `clear ipv6 bgp counters` command resets general statistics of peers. These statistics primarily consist of message-related counts.

**Command Mode**
Privileged EXEC

**Command Syntax**
clear ipv6 bgp [PEERS] counters [VRF_INSTANCES]

**Parameters**
- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**
- clear ipv6 bgp
- clear ipv6 bgp errors
- clear ipv6 bgp neighbor *

**Example**
- This command resets general statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ipv6 bgp counters
! Clearing all IPv4 and IPv6 peering sessions
switch#
```
### clear ipv6 bgp errors

The `clear ipv6 bgp errors` command resets the error statistics and history of peers. Peer general statistics primarily consist of notification errors, socket errors, and update errors.

**Command Mode**

Privileged EXEC

**Command Syntax**

```
clear ipv6 bgp [PEERS] errors [VRF_INSTANCES]
```

**Parameters**

- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intrf_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

**Related Commands**

- `clear ipv6 bgp`
- `clear ipv6 bgp counters`
- `clear ipv6 bgp neighbor *`

**Example**

- This command resets the error statistics of all IPv4 and IPv6 peers in the context-active VRF.

```
switch# clear ipv6 bgp errors
! Clearing all IPv4 and IPv6 peering sessions
switch#
```
14.5.4.33 clear ipv6 bgp neighbor *

The `clear ipv6 bgp neighbor *` command clears BGP neighbors belonging to the IPv4 transport address family. To clear BGP neighbors in the IPv4 transport address family, use the `clear ip bgp neighbor *` command.

Command Mode
Privileged EXEC

Command Syntax
`clear ipv6 bgp neighbor * [VRF_INSTANCE]`

Parameters
- VRF_INSTANCE specifies VRF instance for which IPv6 transport address family BGP neighbors will be cleared. Options include:
  - `<no parameter>` clears IPv6 BGP neighbors in the context-active VRF.
  - `vrf vrf_name` clears IPv6 BGP neighbors in the specified VRF.
  - `vrf all` clears IPv6 BGP neighbors in the all VRFs.
  - `vrf default` clears IPv6 BGP neighbors in the default VRF.

Related Commands
- `clear ipv6 bgp`
- `clear ipv6 bgp counters`
- `clear ipv6 bgp errors`

Examples
- This command clears all IPv4 BGP neighbors in the context-active VRF.

```
switch#clear ip bgp neighbor *
switch#
```

- This command clears all IPv4 BGP neighbors in VRF “purple.”

```
switch#clear ip bgp neighbor * vrf purple
switch#
```
14.5.4.34 clear ipv6 bgp

The `clear ipv6 bgp` command removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required. This command can also clear the switch's BGP sessions with its peers.

Routes that are read or sent are processed through modified route maps or AS-path access lists.

Command Mode
Privileged EXEC

Command Syntax
`clear ipv6 bgp [PEERS] [RESET_TYPE] [DATA_FLOW] [VRF_INSTANCE]`

Parameters
- **PEERS** specifies targeted BGP peers. Options include:
  - `<no parameters>` all IPv4 and IPv6 peers.
  - `*` all IPv4 and IPv6 peers.
  - `ipv4_addr` the IPv4 peer with the specified IPv4 address.
  - `ipv6_addr` the IPv6 peer with the specified IPv6 address.
  - `intra_ipv6_addr` the peer using the specified IPv6 link-local address.
  - `peer-group peer_grp_name` the peers using the specified BGP peer group.
- **RESET_TYPE** specifies the method used to reset routes. Options include:
  - `<no parameters>` performs a hard reset that terminates current BGP sessions and recreates the local routing information base.
  - `soft` performs a soft reset that maintains current BGP sessions and reconfigures the local routing information base using stored routes.
- **DATA_FLOW** restricts soft reset to inbound or outbound routes. Hard reset is bidirectional. Options include:
  - `<no parameters>` resets inbound and outbound routes.
  - `in` resets inbound peer routes.
  - `out` resets outbound peer routes.
- **VRF_INSTANCES** specifies the VRF(s) examined for BGP peers. Options include:
  - `<no parameters>` resets matching peers in the context-active VRF.
  - `vrf_name` resets matching peers in the specified VRF.
  - `all` resets matching peers in all VRFs.
  - `default` resets matching peers in the default VRF.

Related Commands
- `clear ipv6 bgp counters`
- `clear ipv6 bgp errors`
- `clear ipv6 bgp neighbor *`

Guidelines
Use the `clear ipv6 bgp` command after changing any of the following BGP attributes:
- weights
- distribution lists
- timers
- administrative distance

Examples
• This command performs a hard reset of all IPv4 and IPv6 peers in the context-active VRF.

```
switch#clear ipv6 bgp
switch#
```

• This command has the same behavior as the above clear ip bgp command.

```
switch#clear ipv6 bgp *
switch#
```
14.5.4.35 distance bgp

The `distance bgp` command assigns an administrative distance to routes that the switch learns through BGP. Routers use administrative distances to select a route when two protocols provide routing information to the same destination. Distance values range from 1 to 255; lower distance values correspond to higher reliability. BGP routing tables do not include routes with a distance of 255.

The `distance bgp` command assigns distance values to external, internal, and local BGP routes:

- **external**: Best-path routes learned from a neighbor external to the autonomous system. Default distance is 200.
- **internal**: Internal routes are routes learned from a BGP entity within the same autonomous system. Default distance is 200.
- **local**: Local routes are networks listed with a network router configuration command for that router or for networks that are redistributed from another process. Default distance is 200.

The `no distance bgp` and `default distance bgp` commands restore the default administrative distances by removing the `distance bgp` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
distance bgp external_dist [INTERNAL_LOCAL]
no distance bgp
default distance bgp
```

**Parameters**

- **external_dist** distance assigned to external routes. Values range from 1 to 255.
- **INTERNAL_LOCAL** distance assigned to internal and local routes. Values for both routes range from 1 to 255. Options include:
  - `<no parameter>` the `external_dist` value is also assigned to internal and local routes.
  - `internal_dist local_dist` values assigned to internal and local routes.

**Example**

- This command assigns an administrative distance of 150 to external routes, 200 to internal, and 150 to local routes.

```
switch(config)#router bgp 1
switch(config-router-bgp)#distance bgp 150 200 150
switch(config-router-bgp)#
```
14.5.4.36  **dynamic peer max**

The **dynamic peer max** command limits the number of dynamic BGP peers allowed on the switch.

The **no dynamic peer max** and **default dynamic peer max** commands restore the default limit of dynamic BGP peers by removing the **dynamic peer max** command from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

dynamic peer max *maximum*

no dynamic peer max

default dynamic peer max

**Parameters**

- *maximum* the maximum number of dynamic BGP peers to be allowed on the switch. Values range from 1 to 1000; default value is 100.

**Example**

- This command sets the maximum number of dynamic BGP peers allowed on the switch to 200.

```
switch(config)#router bgp 1
switch(config-router-bgp)#dynamic peer max 200
switch(config-router-bgp)#
```
14.5.4.37  graceful-restart stalepath-time

The **graceful-restart stalepath-time** command specifies the maximum time that stale routes from a restarting BGP neighbor will be retained after a BGP session is re-established with that peer.

The **no graceful-restart stalepath-time** and **default graceful-restart stalepath-time** commands restore the default value of 300 seconds by deleting the **graceful-restart stalepath-time** statement from **running-config**.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

`graceful-restart stalepath-time interval`

`no graceful-restart stalepath-time`

`default graceful-restart stalepath-time`

**Parameters**

- **interval** Maximum period (in seconds) that stale routes from a restarting BGP neighbor will be retained after the BGP session is re-established. Values range from 1 to 3600 (60 minutes). Default is 300.

**Example**

- These commands configure the stale path retention interval to 15 minutes.

```bash
switch(config)#router bgp 1
switch(config-router-bgp)#graceful-restart stalepath-time 900
switch(config-router-bgp)#
```
14.5.4.38  graceful-restart-helper

The **graceful-restart helper** command enables BGP graceful restart helper mode on the switch for all BGP neighbors. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default. To configure graceful restart helper mode for a specific neighbor or peer group, use the `neighbor graceful-restart-helper` command. Individual neighbor configuration takes precedence over the global configuration.

The **no graceful-restart helper** command disables graceful restart helper mode on the switch. The **default graceful-restart helper** command enables graceful restart helper mode by removing the corresponding **no graceful-restart helper** command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
graceful-restart helper
no graceful-restart helper
default graceful-restart helper
```

**Example**

- These commands disable graceful restart helper mode on the switch.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no graceful-restart-helper
switch(config-router-bgp)#
```
14.5.4.39  ip as-path access-list

The **ip as-path access-list** command creates an access list to filter BGP route updates. If access list **list_name** does not exist, this command creates it. If it already exists, this command appends statements to the list.

The **no ip as-path access-list** and **default ip as-path access-list** commands delete the named access list.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip as-path access-list  list_name  FILTER_TYPE  regex  ORIGIN

no ip as-path access-list  list_name

default ip as-path access-list  list_name
```

**Parameters**

- **list_name** the name of the AS path access list.
- **FILTER_TYPE** access resolution of the specified AS path. Options include:
  - permit access is permitted.
  - deny access is denied.
- **regex** a regular expression describing the AS path being filtered. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- **ORIGIN** the origin of the path information. Values include:
  - <no parameter> sets the origin to **any**.
  - any any BGP origin.
  - egp EGP origin.
  - igp IGP origin.
  - incomplete incomplete origin.

**Example**

- These commands create an AS path access list named “list1” which allows all BGP routes except those originating in AS 3.

```
switch(config)#ip as-path access-list list1 deny _3$
switch(config)#ip as-path access-list list1 permit .*
```

14.5.4.40  ip as-path regex-mode

The **ip as-path regex-mode** command specifies how the switch will evaluate regular expressions describing AS paths in ACLs. When the regex mode is set to asn, AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match. When it is set to string, AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match. The default mode is asn.

For example, asn mode will return “false” and string mode will return “true” when searching for “10” in an AS path of “100 200.”

The **no ip as-path regex-mode** and **default ip as-path regex-mode** commands restore the regex mode to asn by removing the **ip as-path regex-mode** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```bash
ip as-path regex-mode MODE_SETTING
no ip as-path regex-mode
default ip as-path regex-mode
```

**Parameters**

- **MODE_SETTING** Specifies how regular expressions describing AS paths in AS path ACLs will be evaluated. Options include:
  - **asn** AS numbers in the ACL are interpreted as AS numbers; only complete AS number matches in the AS path return a match.
  - **string** AS numbers in the ACL are interpreted as strings; both complete AS number matches and longer AS numbers that include the target string return a match.

**Example**

- This command sets the regex mode to string.

```
switch(config)#ip as-path regex-mode string
switch(config)#
```
14.5.4.41 ip community-list regexp

The `ip community-list regexp` command creates and configures a BGP access list based on BGP communities. A BGP community access list filters prefixes based on their BGP communities. The command uses regular expressions to identify the communities specified by the list. To create a community list by explicitly specifying one or more communities, use the `ip community-list` command.

The `no ip community-list regexp` and `default ip community-list regexp` commands delete the specified community list. To delete a specific community-list entry, specify the entry in the `no ip community-list regexp` command.

**Command Mode**
Global Configuration

**Command Syntax**

```plaintext
ip community-list regexp list_name {deny | permit} reg_exp
no ip community-list regexp list_name {deny | permit} reg_exp
default ip community-list regexp list_name
```

**Parameters**
- `list_name` name of the community list. Valid input is text.
- `permit` access is permitted for the specified community.
- `deny` access is denied for the specified community.
- `reg_exp` list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

>Note: When using the no form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the no form of the command removes the entire list.

**Related Commands**
- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Guideline**
The `ip community-list regexp` command with the `permit internet` option permits access to only those routes that carry the community value of 0.

**Examples**
- This command creates a BGP community list that permits routes from networks 20-24 and 30-34 in autonomous system 10.

```plaintext
switch(config)#ip community-list regexp list_2 permit 10:[2-3][0-4]_
switch(config)#
```

- This command removes the above statement from the community list named “list_2,” leaving any other statements in the list intact.

```plaintext
switch(config)#no ip community-list regexp list_2 permit 10:[2-3][0-4]_
switch(config)#
```

- This command deletes the community list named “list_2” entirely.

```plaintext
switch(config)#no ip community-list regexp list_2
```
• This command permits access to all routes associated with the BGP community list (CLIST1) that carry the community value 0.

```
switch(config)#ip community-list regexp CLIST1 permit internet
switch(config)#
```
14.5.4.42 ip community-list

The **ip community-list** command creates and configures a BGP access list based on BGP communities.

The **no ip community-list** and **default ip community-list** commands delete the specified community list by removing the corresponding **ip community-list** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip community-list list_name [permit | deny] [GSHUT | aa:nn | internet | local-as | no-advertise | no-export | number]
no ip community-list list_name
default ip community-list list_name
```

**Parameters**

- **list_name** name of the community list. Valid input is text.
- **permit** permits access to the specified community.
- **deny** denies access to the specified community.
- **GSHUT** well-known graceful shutdown community.
- **aa:nn** AA is 65535 and NN specifies the community number (0-65535) within the AS.
- **internet** advertises route to the Internet community.
- **local-as** advertises route only to local peers.
- **no-advertise** does not advertise route to any peer.
- **no-export** advertises route only within BGP AS boundary.
- **number** community number. Values ranges from 0 to 4294967040.

**Related Commands**

- **route-map**
- **match (route-map)**
- **show ip community-list**
- **show ip extcommunity-list**

**Guideline**

EOS does not support disabling the process of graceful shutdown community.

⚠️ **Note:** The **ip community-list** command with the permit internet option permits access to all routes associated with any community.

**Examples**

- This command creates a BGP community list (named “list_9”) that does not match members of route maps configured with AS-network number 100:250.

  ```
  switch(config)#ip community-list list_9 deny 100:250
  switch(config)#
  ```

- These commands create a BGP community list that permits the graceful shutdown community, then use that list it in a route map to permit routes with that community.

  ```
  switch(config)#ip community-list gshut_list permit GSHUT
  switch(config)#route-map map1
  switch(config-route-map-map1)#match community gshut_list
  switch(config-route-map-map1)#exit
  switch(config)#show route-map map1
  ```
route-map map1 permit 10
  Description:
  Match clauses:
    match community gshut_list
  SubRouteMap:
  Set clauses:
switch(config)#

- This command permits access to all routes associated with the BGP community list (CLIST1).

switch(config)#ip community-list CLIST1 permit internet
switch(config)#
14.5.4.43  ip extcommunity-list regexp

The `ip extcommunity-list regexp` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement. The command uses regular expressions to define the extended communities specified by the list. To specify particular values, use the `ip extcommunity-list` command.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The `no ip extcommunity-list regexp` and `default ip extcommunity-list regexp` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list regexp` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip extcommunity-list regexp list_name {deny | permit} reg_exp
no ip extcommunity-list regexp  list_name {deny | permit} reg_exp
default ip extcommunity-list regexp list_name
```

**Parameters**

- **list_name** name of the extended community list. Valid input is text.
- permit access is permitted for the specified extended community list.
- deny access is denied for the specified extended community list.
- **reg_exp** list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
  - Expressions beginning with `RT:` match the route target extended community attribute option.
  - Expressions beginning with `SoO:` match the site of origin extended community attribute option.

**Related Commands**

- route-map
- match (route-map)
- show ip community-list
- show ip extcommunity-list

**Example**

- This command creates a BGP extended community list that denies routes from route target networks 20-24 and 30-34 in autonomous system 10.

```
switch(config)#ip extcommunity-list regexp list_1 deny RT:10:[2-3][0-4]_
switch(config)#
```
14.5.4.44  ip extcommunity-list

The `ip extcommunity-list` command creates an extended community list to filter VRF routes or for link bandwidth (LBW) advertisement.

The following extcommunity-list types are supported:

- **Route Target (rt)** identifies sites that may receive appropriately tagged routes.
- **Site of Origin (soo)** identifies sites where the switch learned the route.
- **Link Bandwidth (lbw)** advertises BGP link bandwidth.

The `no ip extcommunity-list` and `default ip extcommunity-list` commands delete the specified extended community list by removing the corresponding `ip extcommunity-list` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip extcommunity-list list_name {deny | permit} COMM_1 [COMM_2...COMM_n]
no ip extcommunity-list list_name
default ip extcommunity-list list_name
```

**Parameters**

- **list_name** name of the extended community list.
- **permit** access is permitted for the specified community.
- **deny** access is denied for the specified community.
- **COMM_x** extended community attribute. Options include:
  - **rt aa:nn** route target, as specified by autonomous system:network number.
  - **rt ip_addr:nn** route target, as specified by ip address:network number.
  - **soo aa:nn** Site of Origin, as specified by autonomous system:network number.
  - **soo ip_addr:nn** site of origin, as specified by ip address:network number.
  - **lbw** link bandwidth in bits per second.

**Related Commands**

- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Example**

- This command creates a BGP extended community list that denies routes from route target 100:250.

```
switch(config)#ip extcommunity-list list_9 deny rt 100:250
switch(config)#
```
The `ip large-community-list regexp` command creates and configures a BGP access list based on BGP large communities. A BGP large-community access list filters prefixes based on their BGP large community values. The command uses regular expressions to match large communities. Multiple large-community lists with the same name may be specified. To create a large-community list by explicitly specifying one or more communities, use the `ip large-community-list` command.

Large-communities are represented as follows: [ASN]:local-part1:local-part2.

The `no ip large-community-list regexp` and `default ip large-community-list regexp` commands delete the specified large community list. To delete a specific community-list entry, specify the entry in the `no ip large-community-list regexp` command.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip large-community-list regexp list_name {deny | permit} reg_exp
no ip large-community-list regexp list_name {deny | permit} reg_exp
default ip large-community-list regexp list_name
```

**Parameters**
- `list_name` name of the community list. Valid input is text.
- `permit` access is permitted for the specified community.
- `deny` access is denied for the specified community.
- `reg_exp` list of communities, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.

**Note:** When using the no form of the command, a regular expression can be used to specify a single entry to be removed from the list, leaving the rest of the list intact. If no entry is specified, the no form of the command removes the entire list.

**Related Commands**
- `route-map`
- `match (route-map)`
- `show ip community-list`
- `show ip extcommunity-list`

**Examples**
- This command creates a BGP large community list that permits routes from autonomous system 10 with local-part1 value of 20-24 or 30-34.

```
switch(config)#ip large-community-list regexp list_2 permit 10:[2-3][0-4]:_
switch(config)#
```

- This command removes the above statement from the large community list named “list_2,” leaving any other statements in the list intact.

```
switch(config)#no ip large-community-list regexp list_2 permit 10:[2-3][0-4]_
switch(config)#
```

- This command deletes the large community list named “list_2” entirely.

```
switch(config)#no ip large-community-list regexp list_2
```

2456
switch(config)#
14.5.4.46  match as-range

The **match as-range** command defines the match statement for the peer-filter, based on the match statement the peer-filter accept or reject the incoming peer request. The match statement includes a sequence number, AS number range and a match condition to accept or reject a peer by comparing its remote AS number to the specified range. A peer filter can consist of a single match statement or multiple match statements. The match statement for the peer filter is configured under peer-filter configuration mode.

The **no match as-range** or **default match as-range** command deletes the peer-filter condition for the group from **running-config**.

**Command Mode**
Peer-Filter Configuration

**Command Syntax**

```
[sequence_number] match as-range [as_number1] [- as_number2] result {accept | reject}
group_name

no [as_number1] [- as_number2] result {accept | reject} group_name

default [as_number1] [- as_number2] result {accept | reject} group_name
```

**Parameters**

- **sequence_number** optional sequence number for the match statement; one is automatically created if not assigned. Values range from 0 to 65535.
- **group_name** name of the peer filter group.
- **as_number** the autonomous system number, values range from 1 to 4294967295.

**Example**

- These commands define a peer filter that accepts any AS number.

```
switch(config)#peer-filter group1
switch(config-peer-filter-group1)#10 match as-range 1-4294967295 result accept
switch(config-peer-filter-group1)#
```

- These commands define a peer filter that accepts any AS number within 65000 and 65100 (inclusive) except 65008 and 65009.

```
switch(config)#peer-filter group2
switch(config-peer-filter-group2)#10 match as-range 65008-65009 result reject
switch(config-peer-filter-group2)#20 match as-range 65000-65100 result accept
switch(config-peer-filter-group2)#
```

- These commands define a peer filter that accepts 3 specific remote AS numbers.

```
switch(config)#peer-filter group3
switch(config-peer-filter-group3)#10 match as-range 65003 result accept
switch(config-peer-filter-group3)#20 match as-range 65007 result accept
switch(config-peer-filter-group3)#30 match as-range 65009 result accept
switch(config-peer-filter-group3)#
```
14.5.4.47  **maximum-paths (BGP)**

The `maximum-paths` command controls the maximum number of parallel eBGP routes that the switch supports. The default maximum is one route. The command provides an ECMP (equal cost multiple paths) parameter that controls the number of equal-cost paths that the switch stores in the routing table for each route.

For paths to be considered equal, they must have the same weight, local preference, AS-path length, and origin. To require that they also have the same multi-exit discriminator (MED) value, use the `bgp always-compare-med` command. To require that their AS paths have the same contents, use the `no bgp bestpath as-path multipath-relax` command.

The `no maximum-paths` and `default maximum-paths` commands restore the default values of the maximum number of parallel routes and the maximum number of ECMP paths by removing the corresponding `maximum-paths` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
maximum-paths paths [ecmp ecmp_paths]
no maximum-paths
default maximum-paths
```

**Parameters**

- `paths` maximum number of parallel routes. Default value is 1. Value must be less than or equal to the maximum number of ECMP paths.
- `ecmp_paths` maximum number of ECMP paths for each route. Default is maximum value as defined below.

Value for each parameter ranges from 1 to the number of interfaces available per ECMP group, which is platform dependent.

- **Arad**: Values range from 1 to 128. Default value is 128.
- **FM6000**: Values range from 1 to 32. Default value is 32.
- **PetraA**: Values range from 1 to 16. Default value is 16.
- **Trident**: Values range from 1 to 32. Default value is 32.
- **Trident II**: Values range from 1 to 128. Default value is 128.

**Examples**

- These commands configure the maximum number of BGP parallel paths to 12 without changing the default ECMP value.

```
switch(config)#router bgp 1
switch(config-router-bgp)#maximum-paths 12
switch(config-router-bgp)#
```

- These commands configure the maximum number of eBGP parallel routes to 2, with a maximum of 4 equal cost multipath (ECMP) paths for each route.

```
switch(config)#router bgp 1
switch(config-router-bgp)#maximum-paths 2 ecmp 4
switch(config-router-bgp)#
```
neighbor activate

The `neighbor activate` command defines the configuration mode address family activation state of a specified address that is configured as a BGP neighbor. The switch sends the following announcements to addresses active in an address family:

- **IPV4 address family**: IPv4 capability and all network advertisements with IPv4 prefixes.
- **IPv6 address family**: IPv6 capability and all network advertisements with IPv6 prefixes.

The `bgp default` command configures the default address family activation state of addresses configured as BGP neighbors. The `neighbor activate` and `no neighbor activate` commands override the neighbor’s default activation state within the configuration mode address family.

- **neighbor activate**: the specified address is active in the address family.
- **no neighbor activate**: the specified address is not active in the address family.

The `default neighbor activate` command removes the corresponding `neighbor activate` or `no neighbor activate` command from `running-config`, restoring the default address family activation state for the specified neighbor address.

**Command Mode**

Router-BGP Address-Family Configuration

**Command Syntax**

`neighbor neighbor_ID activate`

`no neighbor neighbor_ID activate`

`default neighbor neighbor_ID activate`

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.

**Limitations**

The switch supports the advertisement of networks with IPv6 prefixes to IPv4 transport neighbors. The switch does not support the advertisement of networks with IPv4 prefixes to IPv6 transport neighbors.

**Example**

- These commands activate the advertising of specified neighbors during IPv4 peering sessions, then display the result.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no address-family ipv4
switch(config-router-bgp-af)#neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#neighbor 172.49.22.6 activate
switch(config-router-bgp-af)#no neighbor 172.15.21.18 activate
switch(config-router-bgp-af)#show active
    address-family ipv4
        no neighbor 172.15.21.18 activate
        neighbor 172.49.22.6 activate
        neighbor 172.41.18.15 activate
switch(config-router-bgp-af)#exit
switch(config-router-bgp)#
```
14.5.4.49  neighbor allowas-in

By default, BGP drops received routes if their autonomous system (AS) paths contain the AS number (ASN) of the switch. The `neighbor allowas-in` command configures the switch to accept routes from the specified BGP neighbor even if their AS paths contain the ASN of the switch itself. Optionally, the command can also configure the maximum number of times that the switch’s ASN can appear in a route before it is dropped.

The `no neighbor allowas-in` command configures the default behavior (dropping BGP routes that contain the ASN of the switch).

The default `neighbor allowas-in` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the BGP neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID allowas-in [asn_quantity]
no neighbor neighbor_ID allowas-in
default neighbor neighbor_ID allowas-in
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `asn_quantity` number of repetitions of the switch’s ASN allowed in the AS path of routes received from the specified BGP neighbor. Values range from 1 to 10. Default is 3.

**Related Commands**

This command is used on a customer edge router that is part of a split AS; to address the problem at the provider end, use the `neighbor as-path remote-as replace out` command.

**Example**

- These commands configure the switch to accept routes from the BGP neighbor at 192.168.1.30 which contain the switch’s ASN in their AS paths as many as 3 times.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 allowas-in
switch(config-router-bgp)#
```
14.5.4.50 neighbor as-path remote-as replace out

By default, BGP drops received routes if their autonomous system (AS) paths contain the AS number (ASN) of the switch. In a split AS sharing route advertisements through a provider network, this can result in valid routes being dropped. The `neighbor as-path remote-as replace out` command configures a provider edge switch to replace the customer’s AS with its own in route advertisements sent to neighbors in that AS.

The `no neighbor as-path remote-as replace out` command configures the default behavior (leaving the customer’s AS in the AS path attribute of routes advertised to the specified neighbor).

The `default neighbor as-path remote-as replace out` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the BGP neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID as-path remote-as replace out
no neighbor neighbor_ID as-path remote-as replace out
default neighbor neighbor_ID as-path remote-as replace out
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.

**Related Commands**

This command is used on a provider edge router forwarding BGP routes to a customer in a split AS; to address the problem at the customer end, use the `neighbor allowas-in` command.

**Example**

- These commands configure the switch to substitute its local ASN for the ASN of the BGP neighbor at 192.168.2.15 in BGP routes advertised to that neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.2.15 as-path remote-as replace out
switch(config-router-bgp)#
```
14.5.4.51 neighbor auto-local-addr

The `neighbor auto-local-addr` command configures the switch to automatically determine the local address to be used for the non-transport address family in NLRIs sent to the specified neighbor or peer group. This allows IPv4 NLRIs to be carried over IPv6 transport, or IPv6 NLRIs to be carried over IPv4 transport.

The `no neighbor auto-local-addr` command applies the system default configuration.

The `default neighbor auto-local-addr` command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

Note: While this feature works well in eBGP deployments in which the pairing routers are directly connected and have matching IP address configurations, multi-hop eBGP or iBGP deployments may require manual local address configuration.

To explicitly configure a local address for the non-transport address family for a specific neighbor or peer group, use the `neighbor local-v4-addr` command for IPv6 neighbors, or the `neighbor local-v6-addr` command for IPv4 neighbors.

Command Mode

Router-BGP Configuration

Command Syntax

```bash
neighbor neighbor_ID auto-local-addr
no neighbor neighbor_ID auto-local-addr
default neighbor neighbor_ID auto-local-addr
```

Parameters

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name.

Example

- For the IPv6 neighbor at `2001:0DB8:c2a4:1761::2`, these commands configure the switch to automatically determine the IPv4 NLRI value to be sent during peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 auto-local-addr\nswitch(config-router-bgp)#
```
14.5.4.52 neighbor default-originate

The `neighbor default-originate` command advertises a default route to a BGP neighbor or peer group. This default route overrides the default route advertised by any other means to the specified neighbor or peer group. However, the update generated by `neighbor default-originate` is not processed by neighbor route map out policies.

If a route map is specified in this command, its set clauses are used to modify attributes of the exported default route, but its match clauses are not used to conditionally advertise the route. The default route is always advertised to the specified neighbor.

The `no neighbor default-originate` command applies the system default configuration.

The `default neighbor default-originate` command applies the system default configuration for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

Command Mode

Router-BGP Configuration Router-BGP Address-Family Configuration

Command Syntax

```
neighbor neighbor_ID default-originate [MAP]
no neighbor neighbor_ID default-originate
default neighbor neighbor_ID default-originate
```

Parameters

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- MAP specifies route map that modifies attributes of the exported default route. Options include:
  - `<no parameter>` attributes are not modified by a route map.
  - `route-map map_name` attributes set by specified route map are assigned to the exported default route.

Example

- These commands advertise a default route to the BGP neighbor at 192.168.14.5.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 192.168.14.5 default-originate
switch(config-router-bgp)#
```
14.5.453 neighbor description

The **neighbor description** command associates descriptive text with the specified peer or peer group.

The **no neighbor description** command removes the text association from the specified peer or peer group.

The **default neighbor description** command removes the text association from the specified peer for individual neighbors, and applies the peer group’s description to neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID description description_string
no neighbor neighbor_ID description
default neighbor neighbor_ID description
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name.
- **description_string** text string to be associated with the neighbor or peer group.

**Example**

- These commands associate the string “PEER_1” with the peer located at 192.168.1.30.

```bash
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 description PEER_1
switch(config-router-bgp)#
```
14.5.4.54 neighbor ebgp-multihop

The **neighbor ebgp-multihop** command programs the switch to accept and attempt BGP connections to the external peers residing on networks not directly connected to the switch. The command does not establish the multihop if the only route to the peer is the default route (0.0.0.0).

The **no neighbor ebgp-multihop** command applies the system default configuration.

The **default neighbor ebgp-multihop** command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor neighbor_ID ebgp-multihop [hop_number]
no neighbor neighbor_ID ebgp-multihop
default neighbor neighbor_ID ebgp-multihop
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name.
- **hop_number** time-to-live (hops). Values range from 1 to 255. Default value is 255.

**Example**

- These commands configure the switch to accept and attempt BGP connections to the external peer located at 192.168.1.30, setting the hop limit to 32.

```plaintext
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 ebgp-multihop 32
switch(config-router-bgp)#
```
14.5.4.55  neighbor enforce-first-as

The `neighbor enforce-first-as` command causes a forced comparison of the first autonomous system (AS) in the AS path of eBGP routes received from a specified BGP peer or peer group to the configured remote external peer autonomous system number (ASN). Updates from the specified eBGP peers that do not include an ASN as first AS path (in the AS_PATH attribute) are discarded.

This behavior is enabled globally by default upon BGP configuration, and disabled for the specified neighbor or peer group by the no form of the command. To configure first AS enforcement globally, use the `bgp enforce-first-as` command.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID enforce-first-as
no neighbor neighbor_ID enforce-first-as
default neighbor neighbor_ID enforce-first-as
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name.

**Example**

- This command disables enforcement of the first BGP AS for the neighbors in peer group “region-3.”

```
switch(config-router-bgp)#no neighbor region-3 enforce-first-as
switch(config-router-bgp)#
```
The `neighbor export-localpref` command determines the LOCAL_PREF value that is sent in BGP UPDATE packets to the specified peer or peer group. This command has no effect on external peers.

The `no neighbor export-localpref` command resets the LOCAL_PREF value to the system default of 100 in packets sent to the specified peer or peer group.

The `default neighbor export-localpref` command resets the LOCAL_PREF value to the system default of 100 for individual neighbors, and applies the peer groups’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor neighbor_ID export-localpref preference
no neighbor neighbor_ID export-localpref
default neighbor neighbor_ID export-localpref
```

**Parameters**

- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name.
- `preference` preference value. Values range from 0 to 4294967295.

**Example**

- This command configures the switch to fill the LOCAL_PREF field with 200 in UPDATE packets that it sends to the peer located at 10.1.1.45.

```bash
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.1.1.45 export-localpref 200
switch(config-router-bgp)#
```
14.5.4.57  neighbor graceful-restart

The `neighbor graceful-restart` command enables the BGP graceful restart mode for a specified BGP neighbor or peer group. When graceful restart mode is enabled, the switch retains routes from neighbors that are capable of graceful restart. By default, graceful restart is enabled for all BGP neighbors. Individual neighbor configuration takes precedence over the global configuration.

The `no neighbor graceful-restart` and `default neighbor graceful-restart` commands disable graceful restart mode for the specified BGP neighbor or peer group by removing the corresponding `no neighbor graceful-restart` command from `running-config`.

Command Mode
Router-BGP Configuration

Command Syntax
```
neighbor neighbor_ID graceful-restart
no neighbor neighbor_ID graceful-restart
default neighbor neighbor_ID graceful-restart
```

Parameters
- `neighbor_ID` neighbors's IPv4 or IPv6 address or peer group name.

Example
- This command enables BGP graceful restart mode for the neighbor with the IP address 192.168.12.1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.12.1 graceful-restart
switch(config-router-bgp)#
```
neighbor graceful-restart-helper

The `neighbor graceful-restart helper` command enables BGP graceful restart helper mode for the specified BGP neighbor or peer group. When graceful restart helper mode is enabled, the switch will retain routes from neighbors which are capable of graceful restart while those neighbors are restarting BGP. Graceful restart is enabled by default for all BGP neighbors. To configure graceful restart helper mode for all BGP neighbors, use the `graceful-restart-helper` command. Individual neighbor configuration takes precedence over the global configuration.

The `no neighbor graceful-restart helper` command disables graceful restart helper mode for the specified BGP neighbor or peer group. The `default neighbor graceful-restart helper` command enables graceful restart helper mode for the specified BGP neighbor or peer group by removing the corresponding `no neighbor graceful-restart helper` command from `running-config`.

Command Mode
Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID graceful-restart helper
no neighbor neighbor_ID graceful-restart helper
default neighbor neighbor_ID graceful-restart helper
```

Parameters

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.

Example

- These commands disable graceful restart helper mode for the neighbor at 192.168.12.1.

```
switch(config)#router bgp 1
switch(config-router-bgp)#no neighbor 192.168.12.1 graceful-restart-helper
switch(config-router-bgp)#
```
14.5.4.59 neighbor import-localpref

The `neighbor import-localpref` command determines the local preference assigned to routes received from the specified external peer or peer group. This command has no effect on routes received from internal peers.

The command resets the local preference to the default of 100 for routes received from the specified peer or peer group.

The `default neighbor import-localpref` command resets the local preference to the default of 100 for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

`neighbor neighbor_ID import-localpref preference`

`no neighbor neighbor_ID import-localpref`

`default neighbor neighbor_ID import-localpref`

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `preference` preference value. Values range from 0 to 4294967295.

**Example**

- These commands configure the switch to assign a local preference of 50 to routes received from the peer located at 192.168.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 192.168.1.30 import-localpref 50
switch(config-router-bgp)#
```
14.5.4.60  neighbor local-as

The **neighbor local-as** command enables AS_PATH attribute modification for received eBGP routes, allowing the switch to appear as a member of a different AS to external peers. Arista switches do not prepend the local AS number to routes received from the eBGP neighbor; currently, we implement the command only as **neighbor local-as no-prepend replace-as**.

The **no neighbor local-as** command disables AS_PATH modification for the specified peer or peer group. The **default neighbor local-as** command disables AS_PATH modification for individual neighbors, and applies the peer groups setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor  neighbor_ID local-as  as_id  no-prepend  replace-as
no neighbor  neighbor_ID local-as
default neighbor  neighbor_ID local-as
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name.
- **as_id** AS number that is sent in outbound routing updates in place of the actual AS of the switch. Values range from 1 to 4294967295.

  This parameter cannot be set to the switch’s AS number or to any AS number in the peer’s network.

**Example**

- For the neighbor at 10.13.64.1, these commands remove AS 300 from outbound routing updates and replace it with AS 600.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.13.64.1 local-as 600 no-prepend replace-as
switch(config-router-bgp)#
```
14.5.4.61 neighbor local-v4-addr

The `neighbor local-v4-addr` command specifies the next-hop value that the switch sends as the IPv4 NLRI value to neighbors with whom IPv6 transport peering is established.

The `no neighbor local-v4-addr` command applies the system default configuration.

The `default neighbor local-v4-addr` command applies the system default configuration for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

To configure the switch to automatically determine the IPv4 address to be sent as the next-hop in IPv4 NLRIs to an IPv6 neighbor, use the `neighbor auto-local-addr` command.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID local-v4-addr ipv4_local
no neighbor neighbor_ID local-v4-addr
default neighbor neighbor_ID local-v4-addr
```

**Parameters**

- `neighbor_ID` neighbor's IPv6 address or peer group name.
- `ipv4_local` next hop address.

**Example**

- For the neighbor at 2001:0DB8:c2a4:1761::2, these commands specify an IPv4 NLRI value of 10.7.5.11 to be sent during IPv6 transport peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 2001:0DB8:c2a4:1761::2 local-v4-addr
10.7.5.11
switch(config-router-bgp)#
```
14.5.4.62 neighbor local-v6-addr

The `neighbor local-v6-addr` command specifies the next-hop value that the switch sends as the IPv6 NLRI value to neighbors with which IPv4 transport peering is established.

In IPv6 peering sessions, the switch sends the global IPv6 address of the interface that is used to transmit BGP updates.

The `no neighbor local-v6-addr` command applies the system default configuration.

The `default neighbor local-v6-addr` command applies the system default configuration for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID local-v6-addr ipv6_local
no neighbor neighbor_ID local-v6-addr
default neighbor neighbor_ID local-v6-addr
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 address or peer group name.

**Example**

- For the neighbor at 10.7.5.11, these commands specify an IPv6 NLRI value that is sent during IPv4 transport peering sessions.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
switch(config-router-bgp)#show active
router bgp 1
  bgp log-neighbor-changes
  bgp default ipv6-unicast
  neighbor 10.7.5.11 local-v6-addr 2001:0DB8:c2a4:1761::2
```

```
14.5.4.63  neighbor maximum-routes

The **neighbor maximum-routes** command determines the number of BGP routes the switch accepts from a specified neighbor and defines an action when the limit is exceeded. The default value is 12,000. To remove the maximum routes limit, select a limit of zero.

When the number of routes received from a peer exceeds the limit, the switch generates an error message. This command can also configure the switch to disable peering with the neighbor. In this case, the neighbor state is reset only through a `clear ip bgp` command.

The **no neighbor maximum-routes** command applies the system default maximum-routes value of 12,000 for the specified peer.

The **default neighbor maximum-routes** command applies the system default value for individual neighbors, and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor  neighbor_ID maximum-routes  quantity [ACTION]
no neighbor  neighbor_ID maximum-routes
default neighbor  neighbor_ID maximum-routes
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name.
- **quantity** maximum number of routes. Values include:
  - 0 the switch does not define a route limit.
  - 1 to 4294967294 maximum number of routes.
- **ACTION** switch action when the route limit is exceeded. Values include:
  - `<no parameter>` peering is disabled and an error message is generated.
  - `warning-only` peering is not disabled, but an error message is generated.

**Example**

- This command configures the switch to accept 15000 routes for the neighbor at 10.3.16.210. If the neighbor exceeds 15000 routes, the switch disables peering with the neighbor.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 110.3.16.210 maximum-routes 15000
switch(config-router-bgp)#
```
14.5.64 neighbor next-hop-peer

The `neighbor next-hop-peer` command configures the switch to list the peer address as the next hop in routes that it receives from the specified peer BGP-speaking neighbor or members of the specified peer group. This command overrides the next hop for all routes received from this neighbor or peer group.

The `no neighbor next-hop-peer` command applies the system default (no next-hop override) for the specified peer.

The `default neighbor next-hop-peer` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or the specified peer group.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor neighbor_ID next-hop-peer
no neighbor neighbor_ID next-hop-peer
default neighbor neighbor_ID next-hop-peer
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.

**Example**

- This command configures the peer address of 10.3.2.24 as the next hop for routes advertised to the switch from the peer BGP neighbor.

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.3.2.24 next-hop-peer
switch(config-router-bgp)#
```
14.5.4.65  neighbor next-hop-self

The `neighbor next-hop-self` command configures the switch to list its address as the next hop in routes that it advertises to the specified BGP-speaking neighbor or neighbors in the specified peer group. This is used in networks where BGP neighbors do not directly access all other neighbors on the same subnet.

The `no neighbor next-hop-self` command applies the system default (no next-hop override) for the specified peer.

The `default neighbor next-hop-self` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address or for the specified peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor neighbor_ID next-hop-self
no neighbor neighbor_ID next-hop-self
default neighbor neighbor_ID next-hop-self
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.

**Example**

- This command configures the switch as the next hop for the peer at 10.4.1.30.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.4.1.30 next-hop-self
switch(config-router-bgp)#
```
14.5.66  neighbor out-delay

The `neighbor out-delay` command sets the period of time that a route update for the specified neighbor must be in the routing table before the switch exports it to BGP. The out delay interval is used for bundling routing updates.

The `no neighbor out-delay` command applies the system default (out-delay value of zero) for the specified peer.

The `default neighbor out-delay` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the specified neighbor.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID out-delay delay_time
no neighbor neighbor_ID out-delay delay_time
default neighbor neighbor_ID out-delay delay_time
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `delay_time` the out delay period (seconds). Values range from 0 to 600. Default value is 0.

**Example**

- These commands set the out delay period to 5 seconds for the connection with the peer at 10.24.15.9.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.24.15.9 out-delay 5
switch(config-router-bgp)#
```
14.5.4.67  neighbor passive

The **neighbor passive** command sets the TCP connection for the specified BGP neighbor or peer group to passive mode. When the peer’s transport connection mode is set to passive, it accepts TCP connections for BGP but does not initiate them.

The **no neighbor passive** command sets the specified BGP neighbor or peer group to active connection mode. BGP peers in active mode can both accept and initiate TCP connections for BGP. This is the default behavior.

The **default neighbor passive** command restores the default connection mode. The default mode is **active** for individual BGP peers, or the mode inherited from the peer group for peer group members.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor  neighbor_ID passive
no neighbor  neighbor_ID passive
default neighbor  neighbor_ID passive
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name.

**Example**

- These commands configure the neighbor at IP address 10.2.2.14 to not initiate TCP connections for BGP peering.

```plaintext
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.2.2.14 passive
switch(config-router-bgp)#
```
14.5.4.68  neighbor password

The `neighbor password` command enables authentication on a TCP connection with a BGP peer. The plain-text version of the password is a string, up to 8 bytes in length. Peers must use the same password to ensure proper communication.

`Running-config` displays the encrypted version of the password. The encryption scheme is not strong by cryptographic standards; encrypted passwords should be treated in the same manner as plain-text passwords.

The `no neighbor password` command applies the system default for the specified peer, removing the neighbor password from the configuration and disabling authentication with the specified peer.

The `default neighbor password` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor password` and `default neighbor password` commands remove the neighbor password from the configuration, disabling authentication with the specified peer.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor  neighbor_ID  password  [ENCRYPT_LEVEL]  key_text
no neighbor  neighbor_ID  password
default neighbor  neighbor_ID  password
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `ENCRYPT_LEVEL` the encryption level of the `key_text` parameter. Values include:
  - `<no parameter>` the `key_text` is in clear text.
  - `0` the `key_text` is in clear text. Equivalent to the `<no parameter>` case.
  - `7` the `key_text` is MD5-encrypted.
- `key_text` the password.

**Example**

- This command specifies a password in clear text.

```
switch(config)#router bgp 1
switch(config-router-bgp)#neighbor 10.25.25.13 password 0 code123
switch(config-router-bgp)#
```

`Running-config` stores the password as an encrypted string.
14.5.4.69  neighbor peer group (create)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The `neighbor peer group (create)` command is used to create static BGP peer groups. Static peer groups are peer groups whose members are added manually. To assign BGP neighbors to a static peer group, use the `neighbor peer group (neighbor assignment)` command. To create a dynamic peer group, use the `bgp listen range` command.

The `no neighbor peer group (create)` and `default neighbor peer group (create)` commands remove the specified static peer group from `running-config`. When a static peer group is deleted, the neighbors that were members of that peer group lose any configuration that was inherited from the peer group. The no form of the `bgp listen range` command removes a dynamic peer group.

The `no neighbor` command removes all configuration commands for the specified neighbor.

Command Mode
Router-BGP Configuration

Command Syntax

```
neighbor group_name peer group
no neighbor group_name peer group
default neighbor group_name peer group
```

Parameters
- `group_name` peer group name.

Examples
- These commands create a BGP peer group called “bgpgroup1,” assign several neighbors to the group, apply a route map, and adjust the configuration for one group member.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor bgpgroup1 peer group
switch(config-router-bgp)#neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
switch(config-router-bgp)#neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#show active
router bgp 9
bgp log-neighbor-changes
   neighbor bgpgroup1 peer group
   neighbor bgpgroup1 route-map corporate in
   neighbor bgpgroup1 maximum-routes 12000
   neighbor 10.1.1.1 peer group bgpgroup1
   neighbor 10.2.2.2 peer group bgpgroup1
   neighbor 10.3.3.3 peer group bgpgroup1
   neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
```

- This command removes peer group “bgpgroup1” from `running-config`. The group members remain, but all settings that group members inherited from the peer group are removed.

```
switch(config-router-bgp)#no neighbor bgpgroup1 peer group
switch(config-router-bgp)#show active
```
router bgp 9
  bgp log-neighbor-changes
  neighbor 10.1.1.1 maximum-routes 12000
  neighbor 10.2.2.2 maximum-routes 12000
  neighbor 10.3.3.3 maximum-routes 5000
switch(config-router-bgp)#
14.5.4.70 neighbor peer group (neighbor assignment)

Peer groups allow the user to apply settings to a group of BGP neighbors simultaneously. Once a peer group is created, the group name can be used as a parameter in neighbor configuration commands, and the configuration will be applied to all members of the group. Settings applied to an individual neighbor in the peer group override group settings.

The neighbor peer group (neighbor assignment) command is used to assign BGP neighbors to an existing static peer group. To create a static peer group, use the neighbor peer group (create) command. A neighbor can only belong to one peer group, so issuing this command for a neighbor that is already a member of another group will remove it from that group.

The no neighbor peer group and default neighbor peer group commands remove the specified neighbor from all peer groups. When a neighbor is removed from a peer group, the neighbor retains the configuration inherited from the peer group.

The no neighbor command removes all configuration commands for the specified neighbor.

Command Mode
Router-BGP Configuration

Command Syntax

neighbor NEIGHBOR_ADDR peer group group_name
no neighbor NEIGHBOR_ADDR peer group
default neighbor NEIGHBOR_ADDR peer group

Parameters
• NEIGHBOR_ADDR address of a neighbor being added to peer group. Values include:
  • ipv4_addr neighbor’s IPv4 address.
  • ipv6_addr neighbor’s IPv6 address.
• group_name peer group name.

Examples
• These commands create a BGP peer group called “bgpgroup1,” assign several neighbors to the group, and apply a route map.

```bash
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor bgpgroup1 peer group
switch(config-router-bgp)#neighbor 10.1.1.1 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.2.2.2 peer group bgpgroup1
switch(config-router-bgp)#neighbor 10.3.3.3 peer group bgpgroup1
switch(config-router-bgp)#neighbor bgpgroup1 route-map corporate in
```

• This command removes the neighbor at 1.1.1.1 from the peer group. All settings that neighbor 10.1.1.1 inherited from the peer group are maintained.

```bash
switch(config-router-bgp)#no neighbor 10.1.1.1 peer group
switch(config-router-bgp)#
```
14.5.4.71 neighbor remote-as

The **neighbor remote-as** command configures the expected AS number for a neighbor (peer). This configuration is required to establish a neighbor connection. Internal neighbors have the same AS number; external neighbors have different AS numbers.

**Note:** To establish a BGP session, there must be an IPv4 router ID configured in the same VRF or at least one L3 interface with an IPv4 address in the same VRF. If the VRF contains no L3 interfaces with IPv4 addresses (e.g., in an IPv6-only environment), configure an appropriate router ID using the `router-id (BGP)` command.

The **no neighbor remote-as** command applies the system default for the specified peer or peer group.

The **default neighbor remote-as** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```text
neighbor  neighbor_ID remote-as as_id
no neighbor  neighbor_ID remote-as
default neighbor  neighbor_ID remote-as
```

**Parameters**
- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name.
- **as_id** autonomous system (AS) of the peer. Values range from 1 to 4294967295.

**Example**
- These commands establish a BGP connection with the router at 10.4.3.10 in AS 300.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.4.3.10 remote-as 300
switch(config-router-bgp)#
```
14.5.4.72 neighbor remove-private-as

The `neighbor remove-private-as` command removes private autonomous system numbers from outbound routing updates for external BGP (eBGP) neighbors. When the autonomous system path includes only private autonomous system numbers, the `REMOVAL` parameter specifies how the private autonomous system number is removed.

The `no neighbor remove-private-as` command applies the system default (preserves private AS numbers) for the specified peer.

The `default neighbor remove-private-as` command applies the system default for individual neighbors and applies the peer group's setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
neighbor neighbor_ID remove-private-as [REMOVAL]
no neighbor neighbor_ID remove-private-as
default neighbor neighbor_ID remove-private-as
```

**Parameters**
- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name.
- `REMOVAL` specifies removal of all private AS numbers when the AS path contains only private AS numbers. Values include:
  - `all` removes all private AS numbers from AS path in outbound updates.
  - `all replace-as` all private AS numbers in AS path are replaced with router's local AS number.

**Note:** This command does not support a mix of public and private AS numbers.

**Example**
- These commands program the switch to remove all private AS numbers from outbound routing updates for the eBGP neighbor at 10.5.2.11 only if the AS path does not contain any public AS number.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as
switch(config-router-bgp)#
```

- This command replaces all private AS numbers in the AS path with the switch's local AS number.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.11 remove-private-as all replace-as
switch(config-router-bgp)#
```
14.5.4.73  neighbor rib-in pre-policy retain

By default, inbound BGP routes that are filtered out by the import policy are still stored on the switch. Because all routes are retained, this allows policies to be changed without resetting BGP sessions. It also allows the switch to display all advertised routes when the `show ip bgp neighbor advertised-routes` command is issued.

The `no neighbor rib-in pre-policy retain` command configures the switch to discard information about routes received from the specified neighbor or group that fail the import policy.

The `neighbor rib-in pre-policy retain` command restores the system default behavior (retaining routes from the specified neighbor or group regardless of import policy).

The `default neighbor rib-in pre-policy retain` command applies the system default (retaining all routes) for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

Command Mode

Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID rib-in pre-policy retain inbound [SCOPE]
no neighbor neighbor_ID rib-in pre-policy retain inbound
default neighbor neighbor_ID rib-in pre-policy retain inbound
```

Parameters

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `SCOPE` determines how routes including the switch’s AS number are handled. Values include:
  - `<no parameter>` routes including the switch’s AS number are discarded.
  - all routes including the switch’s AS number are retained.

Example

- These commands configure the switch to discard information about routes from the neighbor at 10.5.2.23 which are filtered out by the switch’s import policies.

```
switch(config)#router bgp 9
switch(config-router-bgp)#no neighbor 10.5.2.23 rib-in pre-policy retain inbound
switch(config-router-bgp)#
```
14.5.4.74  **neighbor route-map (BGP)**

The `neighbor route-map` command applies a route map to inbound or outbound BGP routes. When a route map is applied to outbound routes, the switch will advertise only routes matching at least one section of the route map. Only one outbound route map and one inbound route map can be applied to a given neighbor. A new route map applied to a neighbor will replace the previous route map.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is executed determines the scope of the command:

- In Router-BGP mode, the route map is applied to the specified neighbor in all peering sessions where it is advertised.
- In Router-BGP-Address-Family mode, the route map is applied to the neighbors only in peering sessions corresponding to the configuration-mode address family.

The `no neighbor route-map` command discontinues the application of the specified route map for the specified neighbor and direction. Removing a route map from one direction does not remove it from the other if it has been applied to both.

The `default neighbor route-map` command applies the system default (no route map) for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

**Command Mode**

- Router-BGP Configuration
- Router-BGP Address-Family Configuration

**Command Syntax**

```
neighbor neighbor_ID route-map map_name DIRECTION
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `map_name` name of a route map.
- `DIRECTION` routes to which the route map is applied. Options include:
  - in route map is applied to inbound routes.
  - out route map is applied to outbound routes.

**Example**

- This command applies a route map named “inner-map” to a BGP inbound route from 10.5.2.11.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.11 route-map inner-map in
switch(config-router-bgp)#
```
Participating BGP routers within an AS communicate eBGP-learned routes to all of their peers, but to prevent routing loops they must not re-advertise iBGP-learned routes within the AS. To ensure that all members of the AS share the same routing information, a fully meshed network topology (in which each member router of the AS is connected to every other member) can be used, but this topology can result in high volumes of iBGP messages when it is scaled. Instead, in larger networks one or more routers can be configured as route reflectors.

A route reflector is configured to re-advertise routes learned through iBGP to a group of BGP neighbors within the AS (its clients), eliminating the need for a fully meshed topology.

The `neighbor route-reflector-client` command configures the switch to act as a route reflector and configures the specified neighbor as one of its clients. Additional clients are specified by re-issuing the command.

The `no neighbor route-reflector-client` and `default neighbor route-reflector-client` commands disable route reflection by deleting the `neighbor route-reflector-client` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID route-reflector-client
no neighbor neighbor_ID route-reflector-client
default neighbor neighbor_ID route-reflector-client
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.

**Related Commands**

- `bgp client-to-client reflection`

**Example**

- This command configures the switch as a route reflector and the neighbor at 10.5.2.1 as one of its clients.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.11 route-reflector-client
  switch(config-router-bgp)#
  ```
14.5.4.76  neighbor route-to-peer

The `neighbor route-to-peer` command allows BGP to establish a connection to reach the specified peer using kernel routing table information. By default, route-to-peer configuration is enabled for a peer or a peer group.

The `no neighbor route-to-peer` command prevents BGP from using kernel routing table information to establish a BGP connection to reach a peer and the `default neighbor route-to-peer` command enables route-to-peer configuration for a peer or a peer group by removing the corresponding `no neighbor route-to-peer` command from the `running-config`.

If the peer is directly connected, BGP instead uses ARP table or neighbor table information to establish a BGP connection to reach the peer.

Command Mode
Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID route-to-peer
no neighbor neighbor_ID route-to-peer
default neighbor neighbor_ID route-to-peer
```

Parameters
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or the peer group name.

Example
- These commands establish a connection between the switch and the BGP peer located at IP address 172.16.1.1, and prevent BGP from using kernel routing table information to establish a route to that peer.

```
switch(config)#router bgp 64496
switch(config-router-bgp)#no neighbor 172.16.1.1 route-to-peer
switch(config-router-bgp)#neighbor 172.16.1.1 remote-as 100
switch(config-router-bgp)#
```
The `neighbor send-community add / remove` command modifies the types of community path attributes included for routes in the UPDATE messages advertised to the specified BGP neighbor without having to issue the `no neighbor send-community` command.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID send-community {add | remove} {extended | large | standard}
```

**Parameters**
- `neighbor_ID` neighbor's IPv4 or IPv6 address or peer group name.
- `add` appends the specified community path attribute type to the list of community path attribute types sent to the specified neighbor.
- `remove` removes the specified community path attribute type from the list of community path attribute types sent to the specified neighbor.
- `extended` enables (or disables) sending of the extended community path attribute to the specified neighbor.
- `large` enables (or disables) sending of the large community path attribute to the specified neighbor.
- `standard` enables (or disables) sending of the standard community path attribute to the specified neighbor.
- `link-bandwidth` see `neighbor send-community link-bandwidth` for a description of this parameter.

**Guidelines**
- If the `neighbor send-community` command has been issued for the neighbor without specifying any community types, that neighbor will receive all community attributes in the routes advertised to it. Using the `neighbor send-community add` command then to add an attribute will cause the switch to send only the specified community types in advertised routes. This will result in the other community path attributes no longer being advertised to that BGP peer.
- If all community types are removed using the `neighbor send-community remove` command, the switch will then send routes with all community types. (This behavior is maintained for backward compatibility.) To remove all community path attributes from routes sent to the specified neighbor, use the `no neighbor send-community` command.
- After using this command, issue the `show active` command in Router-BGP Configuration Mode to ensure that the intended attributes are being sent to the specified neighbor.

**Examples**
- These commands configure the switch to send large community attributes in the routes sent to the neighbor at address 10.5.2.24, then add extended community attributes as well.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.24 send-community large
switch(config-router-bgp)#neighbor 10.5.2.24 send-community add extended
switch(config-router-bgp)#show active
switch(config-router-bgp)#neighbor 10.5.2.24 send-community add extended
switch(config-router-bgp)#show active
router bgp 9
 neighbor 10.5.2.24 send-community extended large neighbor 10.5.2.24 maximum-routes 12000
switch(config-router-bgp)#
```
• These commands configure the switch to include extended and large community attributes in the routes sent to the neighbor at address 10.5.2.27, then remove the large attribute from the list of community types to be included.

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.27 send-community extended
    large
switch(config-router-bgp)#neighbor 10.5.2.27 send-community remove
    large
switch(config-router-bgp)#show active
router bgp 600
    neighbor 10.5.2.27 send-community extended
    neighbor 10.5.2.27 maximum-routes 12000
switch(config-router-bgp)#
```

• These commands attempt to configure the switch to remove large community attributes from routes sent to the neighbor at address 10.5.2.28, but send all others. However, because the original command did not specify a list of attributes, the `remove` command has no effect, and all community path attributes are still included.

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.28 send-community
switch(config-router-bgp)#neighbor 10.5.2.28 send-community remove
    large
switch(config-router-bgp)#show active
router bgp 600
    neighbor 10.5.2.28 send-community
    neighbor 10.5.2.28 maximum-routes 12000
switch(config-router-bgp)#
```

• These commands configure the switch to send only large community attributes in routes sent to the neighbor at address 10.5.2.29, then attempt to remove the large attribute from sent routes. However, because this removes the last specified attribute, all community path attributes (including large) will now be included.

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.29 send-community large
switch(config-router-bgp)#neighbor 10.5.2.28 send-community remove
    large
switch(config-router-bgp)#show active
router bgp 600
    neighbor 10.5.2.29 send-community
    neighbor 10.5.2.29 maximum-routes 12000
switch(config-router-bgp)#
```
14.5.4.78 neighbor send-community link-bandwidth

The `neighbor send-community link-bandwidth` command is used to locally regenerate the link-bandwidth value to be advertised to a specific BGP neighbor or peer group. When this command is configured the regenerated link-bandwidth value is included in the extended community path attribute in UPDATE messages.

This command is used specifically for local regeneration of the link-bandwidth value. To send an explicitly-configured link-bandwidth value, add an extended community to a route map instead. (see `set extcommunity (route-map)`) and include extended community attributes in UPDATE messages sent to that neighbor.

Note: The `neighbor send-community` command will override this command and vice-versa.

The `no neighbor send-community` command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The `default neighbor send-community` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

Command Mode
Router-BGP Configuration

Command Syntax

```
neighbor neighbor_ID send-community link-bandwidth {aggregate [reference_speed] | divide {equal | ratio}}
no neighbor neighbor_ID send-community
default neighbor neighbor_ID send-community
```

Parameters

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `aggregate` sends the sum of all link-bandwidth values for all paths toward a prefix to the specified neighbor or to each member of the specified peer group.
  - `reference_speed` optional value to specify a reference link speed in bits/second. Values range from 0.0 to 4294967295.0; larger values can also be expressed using the multiplier K (*10^3), M (*10^6), or G (*10^9). The link speed of the connection to the peer is divided by this value, and the resulting ratio is used to scale down the link-bandwidth advertised to the peer. If the result is >1, the multiplier is ignored and the full aggregate value is advertised.
- `divide` divides the cumulative link-bandwidth value described above among the peers in an Adj-RIB-Out either equally or proportionally.
  - `equal` divides the cumulative total link-bandwidth value equally among all peers in the same Adj-RIB-Out.
  - `ratio` divides the cumulative total link-bandwidth value among peers proportionally according to the speed of the connection to each peer in the Adj-RIB-Out.

Examples

- These commands configure the switch to locally regenerate the link-bandwidth value, dividing the bandwidth proportionally and including it in UPDATE messages to all peers in the peer group “idaho.”

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor idaho send-community link-bandwidth divide ratio
switch(config-router-bgp)#
```
• These commands configure the switch to locally regenerate the link-bandwidth value, scale it down with a reference link speed of 20 gigabits/second, and include it in UPDATE messages to the neighbor at address 10.5.2.24.

```bash
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.24 send-community link-bandwidth aggregate 20G
switch(config-router-bgp)#
```
The `neighbor send-community` command configures the switch to include community path attributes for routes in the UPDATE messages advertised to the specified BGP neighbor. By default, the command enables the switch to send all community attributes: standard, extended, and large. To advertise only a subset of community attributes, use the keyword(s) for the community attribute(s) to be included. To add additional community attributes in a separate command, or to remove specific community attributes from advertised routes, use the `neighbor send-community add / remove` command.

![Note: The neighbor send-community link-bandwidth command will override this command and vice-versa.]

The `no neighbor send-community` command applies the system default (not sending community attributes in BGP UPDATE messages) for the specified peer.

The `default neighbor send-community` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID send-community [extended] [large] [standard]
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `extended` includes extended community attributes.
- `large` includes large community attributes.
- `standard` includes standard community attributes.

**Examples**

- These commands configure the switch to send all community attributes to the neighbor at address 10.5.2.23.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.23 send-community
  switch(config-router-bgp)#
  ```

- These commands configure the switch to include only large community attributes in the routes sent to the neighbor at address 10.5.2.24.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.24 send-community large
  switch(config-router-bgp)#
  ```

- These commands configure the switch to send only standard and large community attributes to the neighbor at address 10.5.2.25.

  ```
  switch(config)#router bgp 9
  switch(config-router-bgp)#neighbor 10.5.2.25 send-community standard large
  switch(config-router-bgp)#
  ```
14.5.4.80  neighbor shutdown

The neighbor shutdown command disables the specified neighbor. Disabling a neighbor also
terminates all of its active sessions and removes associated routing information.

The no neighbor shutdown command enables the specified peer.

The default neighbor shutdown command enables individual neighbors and applies the peer group’s
setting for neighbors that are members of a peer group.

Command Mode
Router-BGP Configuration

Command Syntax
neighbor neighbor_ID shutdown reason REASON

Parameters
• neighbor_ID neighbor’s IPv4 or IPv6 address or peer group name.

Example
• This command disables the neighbor at 10.5.2.23.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.23 shutdown
switch(config-router-bgp)#
```

• This command disables the neighbor at 10.5.2.23 with a reason - planned upgrade. The reason
parameter is optional.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.5.2.23 shutdown reason Planned
upgrade
switch(config-router-bgp)#
```
14.5.4.81 neighbor timers

The **neighbor timers** command configures the BGP keepalive and hold times for a specified peer connection. The **timers bgp** command configures the times on all peer connections for which an individual command is not specified.

- **Keepalive time** is the period between the transmission of consecutive keepalive messages.
- **Hold time** is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The **no neighbor timers** command applies the system default for the specified peer or group (the timers specified by the **timers bgp** command).

The **default neighbor timers** command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The **no neighbor** command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```plaintext
neighbor neighbor_ID timers keep_alive hold_time
no neighbor neighbor_ID timers
default neighbor neighbor_ID timers
```

**Parameters**

- **neighbor_ID** neighbor’s IPv4 or IPv6 address or peer group name.
- **keep_alive** keepalive period, in seconds. Values include:
  - 0 keepalive messages are not sent.
  - 1 to 3600 keepalive time (seconds).
- **hold_time** hold time. Values include:
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

**Example**

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds for the connection with the peer at 10.24.15.9.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.24.15.9 timers 30 90
switch(config-router-bgp)#
```

14.5.4.82 neighbor ttl maximum-hops

The **neighbor ttl maximum-hops** command configures the Generalized TTL Security Mechanism (GTSM) for the specified neighbor(s).

The **no neighbor ttl maximum-hops** command disables the GTSM configuration in the specified neighbor.

The **default neighbor ttl maximum-hops** command applies the system default configuration for individual neighbors; and applies the peer group’s setting for neighbors that are members of a peer group.
**Command-Mode**

Router-BGP Configuration

**Command Syntax**

```
neighbor neighbor_ID ttl maximum-hops hop_number
no sneighbor neighbor_ID ttl maximum-hops
default neighbor neighbor_ID ttl maximum-hops
```

**Parameters**

- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `hop_number` maximum count of hops from a BGP peer. Values range from 0 to 254.

**Example**

- This command configures the TTL security for **10.20.20.30** with a maximum of four hops.

```
switch(config)#router bgp 9
switch(config-router-bgp)#neighbor 10.20.20.30 ttl maximum-hops 4
switch(config-router-bgp)#
```
The `neighbor update-source` command specifies the interface that BGP sessions use for TCP connections. By default, BGP sessions use the neighbor’s closest interface (also known as the best local address).

The `no neighbor update-source` command applies the system default (using best local address for TCP connections) for the specified peer or group.

The default `neighbor update-source` command applies the system default for individual neighbors and applies the peer group’s setting for neighbors that are members of a peer group.

The `no neighbor` command removes all configuration commands for the neighbor at the specified address.

**Command Mode**
Router-BGP Configuration

**Command Syntax**
```
neighbor neighbor_ID update-source INTERFACE
no neighbor neighbor_ID update-source
default neighbor neighbor_ID update-source
```

**Parameters**
- `neighbor_ID` neighbor’s IPv4 or IPv6 address or peer group name.
- `INTERFACE` interface type and number. Options include:
  - ethernet `e_num` Ethernet interface specified by `e_num`.
  - loopback `l_num` loopback interface specified by `l_num`.
  - management `m_num` management interface specified by `m_num`.
  - port-channel `p_num` port-channel interface specified by `p_num`.
  - vlan `v_num` VLAN interface specified by `v_num`.

**Example**
- This command configures the switch to use Ethernet interface 10 for TCP connections for the neighbor at 10.2.2.14.

```
switch(config)# router bgp 9
switch(config-router-bgp)# neighbor 10.2.2.14 update-source ethernet 10
switch(config-router-bgp)#
```
14.5.4.84  neighbor weight

The neighbor weight command assigns a weight attribute value to paths from the specified neighbor. Weight is the first parameter that the BGP best-path selection algorithm considers. When multiple paths to a destination prefix exist, the best-path selection algorithm prefers the path with the highest weight. Other attributes are used only when all paths to the prefix have the same weight.

Weight values range from 0 to 65535 and are not propagated to other switches through route updates. The default weight for paths that the router originates is 32768; the default weight for routes received through BGP is 0.

A path’s BGP weight is also configurable through route maps. Weight values set through route-map commands have precedence over neighbor weight command values.

The no neighbor weight command applies the system default (32768 for router-originated paths, 0 for routes received through BGP) for the specified peer or group.

The default neighbor weight command applies the system default for individual neighbors, and applies the peer group's setting for neighbors that are members of a peer group.

The no neighbor command removes all configuration commands for the neighbor at the specified address.

Command Mode
Router-BGP Configuration

Command Syntax

neighbor neighbor_ID weight weight_value
no neighbor neighbor_ID weight
default neighbor neighbor_ID weight

Parameters

• neighbor_ID neighbor’s IPv4 or IPv6 address or peer group name.
• weight_value weight value. Values range from 1 to 65535.

Example

• This command specifies a weight of 4000 for all paths from the neighbor at 10.1.2.5.

```
switch(config)#router bgp 9
eswitch(config-router-bgp)#neighbor 10.1.2.5 weight 4000
switch(config-router-bgp)#
```
14.5.4.85 network (BGP)

The network command specifies a network for advertisement through UPDATE packets to BGP peers. The configuration zeros the host portion of the specified network address; for example, 192.0.2.4/24 is stored as 192.0.2.0/24. A route map option is available for assigning attributes to the network.

The command is available in Router-BGP and Router-BGP-Address-Family configuration modes. The mode in which the command is issued does not affect the command. The scope of the command depends on the specified network address:

- commands with an IPv4 address are advertised to peers activated in the IPv4 address family.
- commands with an IPv6 address are advertised to peers activated in the IPv6 address family.

The no network and default network commands remove the network from the routing table, preventing its advertisement.

Command Mode
Router-BGP Configuration
Router-BGP Address-Family Configuration

Command Syntax

```
network NET_ADDRESS [ROUTE_MAP]
no network NET_ADDRESS
default network NET_ADDRESS
```

Parameters

- NET_ADDRESS IP address range. Entry options include:
  - `ipv4_subnet` IPv4 subnet (CIDR notation).
  - `ipv4_addr` mask subnet IPv4 subnet (address-mask notation).
  - `ipv6_prefix` neighbor’s IPv6 prefix (CIDR notation).
- ROUTE_MAP specifies route map that assigns attribute values to the network. Options include:
  - `<no parameter>` attributes are not assigned through a route map.
  - `route-map map_name` attributes listed by specified route map are assigned to the network.

Example

- This command enables BGP advertising for the network located at 10.1.2.5. The configuration stores the network as 10.1.2.5.

```
switch(config)#router bgp 9
switch(config-router-bgp)#network 10.1.2.5/24
switch(config-router-bgp)#
```
14.5.4.86  no neighbor

The no neighbor command removes all neighbor configuration commands for the specified neighbor.

Neighbor settings can also be removed individually; refer to the command description page of the desired command for details. Neighbor settings for a peer group must be removed individually.

Command Mode
Router-BGP Configuration

Command Syntax
no neighbor neighbor_ID
default neighbor neighbor_ID

Parameters
• neighbor_ID neighbor’s IPv4 or IPv6 address. This command does not accept a peer group name as an argument; peer group settings must be removed individually.

Example
• This command removes all neighbor configuration commands for the neighbor at 10.1.1.1.

switch(config)#router bgp 9
switch(config-router-bgp)#no neighbor 10.1.1.1
switch(config-router-bgp)#
14.5.4.87  rd (Router-BGP VRF and VNI Configuration Modes)

The `rd` command adds a route distinguisher (RD) to VRF and VNI configuration modes. RDs internally identify routes belonging to a VRF or VNI to distinguish overlapping or duplicate IP address ranges. This allows the creation of distinct routes to the same IP address for different VPNs. The RD is a 64-bit number made up of an AS number or IPv4 address followed by a user-selected ID number. If the switch is not running EVPN, an RD is not required for a VRF or VNI to function. Use no or default command forms to remove an RD from a VRF or VNI.

**Note:** Legacy RDs that were assigned in VRF Configuration Mode appear in `show vrf` outputs if an RD has not been configured using this command, but they no longer have an effect on the system. RDs assigned in the VNI Configuration Mode are displayed in the output of `show bgp evpn` command.

**Command Modes**
Router-BGP VRF Configuration
Router-BGP VNI Configuration

**Command Syntax**

```
rd admin_ID:local_assignment
no rd
default rd
```

**Parameters**

- `admin_ID` an AS number or globally assigned IPv4 address identifying the entity assigning the RD. This should be an IANA-assigned identifying number.
- `local_assignment` a locally assigned number distinguishing the VRF. Values range from 0-65535 if the `admin_ID` is an IPv4 address, or from 0-4,294,967,295 if the `admin_ID` is an AS number. If the `admin_ID` is an AS number, the `local_assignment` can also be entered in the form of an IPv4 address.

**Examples**

- These commands identify the administrator of the VRF called “purple” as AS 530 and assign 12 as its local number.

  ```
  switch(config)#router bgp 50
  switch(config-router-bgp)#vrf purple
  switch(config-router-bgp-vrf-purple)#rd 530:12
  ```

- These commands identify the administrator of the MAC-VRF called “bundle1” as AS 530 and assign 12 as its local number.

  ```
  cvx(config)#router bgp 100
  cvx(config-router-bgp)#vni-aware-bundle bundle1
  cvx(config-macvrf-bundle1)#rd 530:12
  ```
14.5.4.88 redistribute (BGP)

The **redistribute** command enables the redistribution of specified routes to the BGP domain.

The **no redistribute** and **default redistribute** commands disable route redistribution from the specified domain by removing the corresponding **redistribute** command from **running-config**.

Note: Aggregate routes are redistributed automatically, and their redistribution cannot be disabled.

Command Mode

Router-BGP Configuration

Command Syntax

redistribute **ROUTE_TYPE** [**ROUTE_MAP**]

no redistribute **ROUTE_TYPE**

default redistribute **ROUTE_TYPE**

Parameters

- **ROUTE_TYPE** source from which routes are redistributed. Options include:
  - connected routes that are established when IP is enabled on an interface.
  - match nssa-external all OSPF NSSA external routes.
  - match nssa-external 1 type 1 OSPF NSSA external routes.
  - match nssa-external 2 type 2 OSPF NSSA external routes.
  - ospf routes from an OSPF domain.
  - ospf match external routes external to the AS, but imported from OSPF.
  - ospf match internal OSPF routes that are internal to the AS.
  - ospf match nssa-external all OSPF NSSA external routes.
  - ospf match nssa-external 1 type 1 OSPF NSSA external routes.
  - ospf match nssa-external 2 type 2 OSPF NSSA external routes.
  - ospf3 routes from an OSPFv3 domain.
  - ospf3 match external routes external to the AS, but imported from OSPFv3.
  - ospf3 match internal OSPFv3 routes that are internal to the AS.
  - rip routes from a RIP domain.
  - static IP static routes.
  - isis IS-IS routes. Sub-options include.
    - level-1 redistribute IS-IS level-1 routes.
    - level-1-2 redistribute IS-IS level-1 and level-2 routes.
    - level-2 redistribute IS-IS level-2 routes.
    - route-map route map reference.

  Note: While redistributing IS-IS routes into BGP, the level-1 or level-2 keyword can be used to selectively redistribute level-1 routes or level-2 routes into BGP. The level-1 or level-2 keyword is optional, and the command defaults to level-2 when it is not configured.

- **ROUTE_MAP** route map that determines the routes that are redistributed. Options include:
  - <no parameter> all routes are redistributed.
  - route-map **map_name** only routes in the specified route map are redistributed.

Example

- These commands redistribute OSPF routes into the BGP domain.

```bash
switch(config)#router bgp 1
```
• These commands redistribute ISIS routes into the BGP domain in address-family mode.

```
switch(config-router-bgp)#redistribute OSPF
switch(config-router-bgp)#
```

```
Switch(config)#router bgp 1
switch(config-router-bgp)#address-family ipv4
switch(config-router-bgp-af)#redistribute isis level-1 route-map isis-to-bgp-v4
switch(config-router-bgp-af)#
```

• These commands redistribute ISIS routes into the BGP domain in router-bgp mode.

```
switch(config)#router bgp 1
switch(config-router-bgp)#redistribute isis level-1 route-map isis-to-bgp
switch(config)#
```
14.5.4.89  router bgp

The `router bgp` command places the switch in router-BGP configuration mode. If BGP was not previously instantiated, this command creates a BGP instance with the specified AS number. Router-BGP configuration mode is not a group-change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

When a BGP instance exists, the command must include the AS number of the existing BGP instance. Running this command with a different AS number generates an error message.

The `no router bgp` and `default router bgp` commands delete the BGP instance.

The `exit` command returns the switch to global configuration mode.

**Command Mode**
Global Configuration

**Command Syntax**

`router bgp as_id`

`no router bgp`

`default router bgp`

**Parameters**

- `as_id` autonomous system (AS) number. Values range from 1 to 4294967295.

**Examples**

- This command creates a BGP instance with AS number 64500.

  ```
  switch(config)#router bgp 64500
  switch(config-router-bgp)#
  ```

- This command attempts to open a BGP instance with a different AS number from that of the existing instance. The switch displays an error and stays in global configuration mode.

  ```
  switch(config)#router bgp 64501
  % BGP is already running with AS number 64500
  switch(config)#
  ```

- This command exits BGP configuration mode.

  ```
  switch(config-router-bgp)#exit
  switch(config)#
  ```

- This command deletes the BGP instance.

  ```
  switch(config)#no router bgp
  switch(config)#
  ```
14.5.4.90  router-id (BGP)

The `router-id` command sets the local router BGP router ID.

When no ID has been specified, the local router ID is set to the following:

• the loopback IP address when a single loopback interface is configured.
• the loopback with the highest IP address when multiple loopback interfaces are configured.
• the highest IP address on a physical interface when no loopback interfaces are configured.

Note: The router ID must be specified if the switch has no IPv4 addresses configured.

The `no router-id` and `default router-id` commands remove the `router-id` command from `running-config`.

Command Mode

Router-BGP Configuration

Command Syntax

`router-id id_num`
`no router-id [id_num]`
`default router-id [id_num]`

Parameters

• `id_num` router ID number (32-bit dotted decimal notation).

Example

• This command configures the fixed router ID address of 10.10.4.11.

```
switch(config)#router bgp 9
switch(config-router-bgp)#router-id 10.10.4.11
switch(config-router-bgp)#
```
14.5.4.91  show bgp convergence

The show bgp convergence command displays information about the Border Gateway Protocol (BGP) convergence state and other statistics about the BGP instance in the specified VRF or in all VRFs.

Command Mode
EXEC

Command Syntax
show bgp convergence [VRF_INSTANCE]

Parameters
• VRF_INSTANCE specifies VRF instances. Options include:
  • <no parameter> displays BGP information for the context-active VRF.
  • vrf vrf_name displays BGP information for the specified VRF.
  • vrf all displays BGP information for all VRFs.
  • vrf default displays BGP information for the default VRF.

Examples
• This command displays the output when no peers have joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event : None
Bgp convergence state : Not Initiated (Waiting for the first peer to join)
  Convergence timer is not running
  Convergence timeout in use: 00:02:30
  Convergence slow peer timeout in use: 00:00:55
  First peer is not up yet
  All the expected peers are up: no
  All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 2
Total Peers: 2
Established Peers: 0
Disabled Peers: 0
Peers that have not converged yet:
  IPv4 peers:
    201.1.1.1 (Session : Connect)
    202.1.1.1 (Session : Connect)
  IPv6 peers:
    None
switch#
```

• This command displays the output when the first peer has joined before convergence.

```
switch#show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:40 ago
Bgp convergence state : Pending (Waiting for EORs/Keepalives from peer(s) and IGP convergence)
```

Convergence timer running, will expire in 00:01:50
Convergence timeout in use: 00:02:30
Convergence slow peer timeout in use: 00:00:55
First peer came up 00:00:13 ago
All the expected peers are up: no
All IGP protocols have converged: yes
Outstanding EORs: 0, Outstanding Keepalives: 0
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that have not converged yet:
IPv4 peers:
201.1.1.1 (Session : Active)
IPv6 peers:
None
switch#

• This command displays the output when the convergence timeout value is reached.

switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:02:30
Configured convergence slow peer timeout: 00:00:55
Convergence based update synchronization is enabled
Last Bgp convergence event 00:02:44 ago
Bgp convergence state : Timeout reached
Time taken to converge 00:02:30
Pending Peers: 1
Total Peers: 2
Established Peers: 1
Disabled Peers: 0
Peers that did not converge before local bgp convergence:
IPv4 peers:
201.1.1.1 (Session : Active)
201.1.1.1 (Session : Established)
IPv6 peers:
None
switch#

• This command displays the output during the converged state.

switch# show bgp convergence
BGP Convergence information for VRF: default
Configured convergence timeout: 00:05:00
Configured convergence slow peer timeout: 00:01:30
Convergence based update synchronization is enabled
Last Bgp convergence event 00:00:05 ago
Bgp convergence state : Converged
Time taken to converge 00:00:02
First peer came up 00:00:05 ago

switch#
14.5.4.92 show bgp flow-spec

The `show bgp flow-spec ipv4` displays a brief description of each flowspec rule, including the matching rule and actions.

**Command Mode**
EXEC

**Command Syntax**
```
show bgp flow-spec [ipv4 | ipv6] [summary | detail] [vrf VRFNAME]
```

**Parameters**
- **ipv4** Displays information related to IPv4.
- **ipv6** Displays information related to IPv6.
- **summary** Displays summarized BGP information.
- **detail** Displays detailed information.
- **vrf VRFNAME** Displays flowspec information in the named VRF.

**Related Command**
```
show flow-spec
```

**Example**

The `show bgp flow-spec ipv4 summary` command displays the count of flowspec rules received from each peer:

```
switch(config)#show bgp flow-spec ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 10
Neighbor Status Codes: m - Under maintenance
           Neighbor  V  AS  MsgRcvd  MsgSent  InQ  OutQ  Up/Down State  RulesRcd  RulesAcc
          10.0.0.2  4  10    12      4    0    0 00:02:18 Estab  2     2
          10.0.1.2  4  10     6      4    0    0 00:02:18 Estab  0     0
```

The `show bgp flow-spec detail` displays the full details of each flowspec rule including the peer(s) it was received from, BGP properties, and an expanded description of the matching rule:

```
switch(config)#show bgp flow-spec ipv4 detail
BGP Flow Specification rules for VRF default
Router identifier 0.0.0.1, local AS number 10
BGP Flow Specification Matching Rule for 10.2.3.0/24;*;
Rule identifier: 3882065752
Matching Rule:
  Destination Prefix: 10.2.3.0/24
  Source Prefix: *
  Paths: 1 available

  Paths: 1 available
Local
  from 10.0.0.2 (10.1.1.2)
```

2509
Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
Actions: Drop
14.5.4.93  show bgp instance

The `show bgp instance` command displays summary Border Gateway Protocol (BGP) information about the BGP instance in the specified VRF or in all VRFs.

**Command Mode**

EXEC

**Command Syntax**

```
show bgp instance [VRF_INSTANCE]
```

**Parameters**

- `VRF_INSTANCE` specifies VRF instances. Options include:
  - `<no parameter>` displays BGP information for the context-active VRF.
  - `vrf vrf_name` displays BGP information for the specified VRF.
  - `vrf all` displays BGP information for all VRFs.
  - `vrf default` displays BGP information for the default VRF.

**Examples**

- This command displays information about the BGP instance in the context-active VRF.

  ```
  switch#show bgp instance
  BGP instance information for VRF purple
  BGP Local AS:  64497, Router ID: 1.2.3.5
  Total peers:              5
  Configured peers:         3
  UnConfigured peers:      2
  Established peers:       3
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
  BGP has converged:no
  Outstanding EORs:0,Outstanding Keepalives: 0
  Convergence timeout: 00:10:00
  switch#
  ```

- This command displays information about the BGP instance in the default VRF.

  ```
  switch#show bgp instance vrf default
  BGP instance information for VRF default
  BGP Local AS:  64503, Router ID: 1.2.3.5
  Total peers:              1
  Configured peers:         1
  UnConfigured peers:      0
  Disabled peers:         0
  Established peers:       0
  Graceful restart helper mode enabled
  End of rib timer timeout: 00:05:00
  BGP Convergence timer is inactive
  BGP Convergence information:
  BGP has converged:no
  Outstanding EORs:0,Outstanding Keepalives: 0
  Convergence timeout: 00:10:00
  switch#
  ```
14.5.4.94  show bgp labeled-unicast tunnel

The `show bgp labeled-unicast tunnel` command displays the contents of the BGP labeled-unicast (LU) tunnel table. The user can optionally specify a tunnel index parameter to view the specific single tunnel information.

**Command Mode**

EXEC

**Command Syntax**

`show bgp labeled-unicast tunnel` *tunnel_index*

**Parameters**

- `tunnel_index` index to view single tunnel information.

**Example**

- This command displays the BGP LU tunnel table.

```
switch#show bgp labeled-unicast tunnel
 Index Endpoint   Nexthop  Interface   Labels          Contributing Metric Metric 2 Pref Pref 2
----- ---------- -------- ----------- --------------- ------------ ------ -------- ---- ------
 5     2.0.0.0/24 10.1.1.2 'Ethernet3' [ 123 899 900 ] Yes          0      100      200  0
 6     2.0.1.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes          0      100      200  0
 7     2.0.2.0/24 10.1.1.2 'Ethernet3' [ 400 500 600 ] Yes          0      100      200  0
switch#
```

- This command displays the BGP LU tunnel table for tunnel index 4.

```
switch#show bgp labeled-unicast tunnel 4
 Index Endpoint        Nexthop/Tunnel Index   Interface       Labels   Contributing Metric Metric 2  Pref  Pref 2
------  --------------- ---------------------- --------------- -------- ------------ ------ --------- ----- ------
 4      10.253.0.10/32 10.1.0.0               Port-Channel111 [ 3 ]     Yes          0      0        200    0
switch#
```
**14.5.4.95 show bgp neighbors history**

The `show bgp neighbors history` command stores and displays a list of failed BGP connection attempts for each peer. This may be particularly useful while troubleshooting flappy connections. If dynamic peering is enabled, the failure history will be remembered even after the peers are no longer present.

**Command Mode**
EXEC

**Command Syntax**

```
show bgp neighbors [PEER | PREFIX | peer-group PEER_GROUP] history [connect-failures] vrf VRF
```

**Parameters**

- **PEER** An IPv4 or IPv6 valid address.
- **PREFIX** An IPv4 or IPv6 valid prefix.
- **peer-group** PEER_GROUP A peer group name.
- **connect-failures** Optional and will not affect the result.
- **vrf** VRF A VRF name. If it is not supplied, the command will act upon the VRF default.

**Guidelines**

Relevant error messages are recorded by default, without any configuration. To clear all messages for a peer or group of peers, though, it is necessary to use the command `clear bgp history`. The syntax for this command is described as:

```
switch#clear bgp [PEER|PREFIX|peer-group PEER_GROUP] history [connect-failures] [vrf VRF]
```

If no peer, prefix, or peer-group is supplied, this command will clear the history for all peers in the specified VRF.

- The number of recorded messages is limited to eight per peer.
- Only errors that occur prior to session establishment will be recorded.
- The `show bgp neighbors history` is available only with the multi-agent protocol model.

**Related Command**

`clear bgp history`

**Example**

For each peer, its address will be printed at the first line, along with the VRF it’s part of. Then, a table will be printed with the following columns:

- **Type**: the peer connection type. May be Static or Dynamic.
- **AS**: the remote Autonomous System number.
- **Time**: the time of the failure, using the local timezone.
- **Event**: a description related to the cause of the failed BGP connection.

```
switch>show bgp neighbors history

14.5.4.96  show flow-spec

The `show flow-spec` command displays an overall status of how many flowspec rules were received and how many were installed.

**Command Mode**

EXEC

**Command Syntax**

`show flow-spec (ipv4 | ipv6) [summary ] [vrf VRFNAME]`

**Parameters**

- `ipv4` Displays information related to IPv4.
- `ipv6` Displays information related to IPv6.
- `summary` Displays summary of flow-spec rule.
- `vrf VRFNAME` Displays flow-spec information in the named VRF.

**Related Command**

`show bgp flow-spec`

**Example**

- The `show flow-spec ipv4 summary` command displays an overall status of how many flowspec rules were received and how many were installed:

  ```
  switch(config)#show flow-spec ipv4 summary
  Flow specification rules summary for VRF default
  Total number of rules: 2
  Number of installed rules: 2
  ```

- The `show flow-spec ipv4` displays the installation status of the rule, and a counter of how many hits it has accumulated. This command also compiles the received flowspec rules into rules that can be programmed into the TCAM. For example, logical expressions on values such as the destination port are converted to ranges, as shown below:

  ```
  switch(config)#show flow-spec ipv4
  Flow specification rules for VRF default
  Applied on: Ethernet47/1
  Flow-spec rule: 10.2.3.0/24;*;
  Rule identifier: 3882065752
  Matches:
  Destination prefix: 10.2.3.0/24
  Actions:
  Police: 80 Mbps (10 MBps)
  Redirect: VRF customer1
  Route via LDP tunnel index 4, MPLS label 100123
  Route via LDP tunnel index 1, MPLS label 116507
  Status:
  Installed: yes
  Counter: 312 packets
  Flow-spec rule: 10.2.4.0/24;10.2.0.0/16;IP:=6|=17;DP:>1010&<1024;
  Rule identifier: 3882090640
  Matches:
  Destination prefix: 10.2.4.0/24
  Source prefix: 10.2.0.0/16
  Next protocol: 17
  6
  Destination port: 1011-1023
  Actions:
  Police: 80 Mbps (10 MBps)
  Redirect: VRF customer1
  ```
<table>
<thead>
<tr>
<th>Route via LDP tunnel index 4, MPLS label 100123</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route via LDP tunnel index 1, MPLS label 116507</td>
</tr>
</tbody>
</table>

**Status:**
- **Installed:** yes
- **Counter:** 0 packets
14.5.4.97  show ip as-path access-list

The `show ip as-path access-list` command displays BGP filters on the switch. Specifying an access list displays the statements from that access list. Entering the command without parameters displays the statements from all access lists on the switch.

**Command Mode**
EXEC

**Command Syntax**

`show ip as-path access-list [list_name]`

**Parameters**

- `list_name` the name of an AS path access list.

**Example**

- This command displays the contents of the AS path access list named “list1.”

```
switch# show ip as-path access-list list1
ip as-path access-list list1 deny _3$
ip as-path access-list list1 permit .*
switch#
```
14.5.4.98  show ip bgp community

The `show ip bgp community` command displays Border Gateway Protocol (BGP) routing table entries, filtered by community.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp community COMM_1 [COMM_2... COMM_n] [MATCH_TYPE] [DATA_OPTION] [VRF_INSTANCE]
```

**Parameters**

- **COMM_x** community number or name, as specified in the route map that sets the community list number.
  - GSHUT well-known graceful shutdown community.
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - internet advertises route to Internet community.
  - local-as advertises route only to local peers.
  - no-advertise does not advertise the route to any peer.
  - no-export advertises route only within BGP AS boundary.
- **MATCH_TYPE** routes are filtered based on their communities. Options include:
  - `<no parameter>` routes must match at least one community in the list.
  - exact route must match all communities and include no other communities.
  - regex display routes matching the regular expression of communities.
- **DATA_OPTION** type of information the command displays. Options include:
  - `<no parameter>` displays table of the routing entry line items.
  - detail displays data block for each routing table entry.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - vrf `vrf_name` displays routing table for the specified VRF.
  - vrf all displays routing table for all VRFs.
  - vrf default displays routing table for default VRF.

**Guidelines**

The interpretation of regular expressions is always based on string mode but not on the ACL configuration.

**Example**

- This command displays the BGP routing table entries with the community 64496:1000.

```
switch#show ip bgp community 64496:1000 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 10.100.1.0/24
Paths: 1 available
  64496 64497 65536
  10.1.0.100 from 10.1.0.100 (10.0.0.100)
    Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0,
    received 00:03:16 ago, valid, external, best
    Community: 655:23590 64496:1000
    Rx SAFI: Unicast
```
switch#
14.5.4.99  show ip bgp installed

The `show ip bgp installed` command displays the list of installed routes in the RIB.

**Command Mode**

EXEC

**Command Syntax**

`show ip bgp installed`

**Example**

- This command displays the list of installed routes in the RIB.

```
switch# show ip bgp installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>

</tr>
</tbody>
</table>

switch#
```
14.5.4.100 show ip bgp neighbors (route type)

The `show ip bgp neighbors (route type)` command displays information for next-hop routes to a specified IPv4 neighbor. The `show ip bgp neighbors (route-type) community` command displays the same information for routes filtered by communities.

The output format depends on the selected FILTER parameter:
- data-block format displays comprehensive information for each specified route.
- tabular format displays routing table entries in tabular format for the specified IP addresses.

Commands that do not include a route type revert to the `show ip bgp neighbors` command.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
show ip bgp neighbors neighbor_addr [ROUTE_TYPE] HOPDIRECT [detail]
```

**Related Commands**

- `show ip bgp neighbors`
- `show ip bgp neighbors (route-type) community`

**Parameters**

- `neighbor_addr` location of the neighbor.
- `ROUTE_TYPE` filters route on route type. Options include:
  - `ipv4 unicast` displays IPv4 unicast routes.
  - `ipv6 unicast` displays IPv6 unicast routes.
- `HOPDIRECT` filters route on the basis of direction from neighbor. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `FILTER` routing table entries that the command displays. Values include:
  - `<no parameter>` displays all routing table entries in tabular format.
  - `detail` displays all routing table entries in data-block format.
  - `ipv4_addr` displays IPv4 host address in data-block format.
  - `ipv4_prefix` displays the route information of specified IPv4 prefix in data-block format. Option includes:
    - `longer-prefixes` displays the route information of IPv4 prefix in data-block format.
- `VRF_INSTANCE` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

- This command displays information for routes advertised to the neighbor at 10.3.0.103.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
```

switch#
14.5.4.101 show ip bgp neighbors (route-type) community

The `show ip bgp neighbors (route-type) community` command displays information for next-hop routes to a specified neighbor. Routes are filtered by community.

The `show ip bgp neighbors (route-type)` command displays the same information for routes filtered by IP addresses and subnets.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors addr RTE community CM_1 [CM_2...CM_n] [MATCH] [INFO]
[VRF_INST]
```

**Related Commands**

- `show ip bgp neighbors`
- `show ip bgp neighbors (route-type)`

**Parameters**

- **addr** location of the neighbor.
- **RTE** type of route that the command displays. Options include:
  - advertised-routes displays routes advertised to the specified neighbor.
  - received-routes displays routes received from the specified neighbor (accepted and rejected).
  - routes displays routes received and accepted from specified neighbor.
  - CM_x community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
    - GSHUT well-known graceful shutdown community.
    - aa:nn AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
    - comm_num community number. Values range from 1 to 4294967040.
    - internet advertises route to Internet community.
    - local-as advertises route only to local peers.
    - no-advertise does not advertise route to any peer.
    - no-export advertises route only within BGP AS boundary.
  - MATCH routes are filtered based on their communities.
    - <no parameter> routes must match at least one community in the list.
    - exact route must match all communities and include no other communities.
  - INFO type of information the command displays. Values include:
    - <no parameter> displays table of routing entry line items.
    - detail displays data block for each routing table entry.
  - VRF_INST specifies VRF instances. Options include:
    - <no parameter> displays routing table for context-active VRF.
    - vrf vrf_name displays routing table for the specified VRF.
    - vrf all displays routing table for all VRFs.
    - vrf default displays routing table for default VRF.

**Example**

- This command lists the routes advertised to the neighbor at 10.3.0.103 with community 655:23590.

```
switch# show ip bgp neighbors 10.3.0.103 advertised-routes community 655:23590
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
```

Routing Protocols

14.5.4.102  show ip bgp neighbors regexp

The `show ip bgp neighbors regexp` command displays information for next-hop routes to a specified IPv4 neighbor that match the AS path attributes specified in the given regular expression.

**Command Mode**
EXEC

**Command Syntax**
```
show ip bgp neighbors <addr> RTE regexp as_paths [VRF_INST]
```

**Related Commands**
- `show ip bgp neighbors`
- `show ip bgp neighbors (route type)`

**Parameters**
- `<addr>` location of the neighbor.
- `RTE` type of route that the command displays. Options include:
  - advertised-routes displays routes advertised to the specified neighbor.
  - received-routes displays routes received from the specified neighbor (accepted and rejected).
  - routes displays routes received and accepted from specified neighbor.
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- `VRF_INST` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**
- This command lists the routes advertised to the neighbor at 10.3.0.103 where the AS path is 64496.

```
switch#show ip bgp neighbors 10.3.0.103 advertised-routes regex ^64496$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nextrhop - Link Local Nextrhop

```

switch#
14.5.4.103 show ip bgp neighbors

The `show ip bgp neighbors` command displays Border Gateway Protocol (BGP) and TCP-session data for a specified IPv4 BGP neighbor, or for all IPv4 BGP neighbors if an address is not specified.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp neighbors [NEIGHBOR_ADDR] [VRF_INSTANCE]
```

**Parameters**

- **NEIGHBOR_ADDR** location of the neighbors. Options include:
  - `<no parameter>` command displays information for all IPv4 BGP neighbors.
  - `ipv4_addr` command displays information for specified neighbor.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for the default VRF.

**Related Command**

- `show ip bgp neighbors (route type)`
- `show ip bgp neighbors (route-type) community`

**Example**

- This command displays information of the neighbor at 10.1.0.100.

```
switch#show ip bgp neighbors 10.1.0.100
BGP neighbor is 10.1.0.100, remote AS 64496, external link
  BGP version 4, remote router ID 10.0.0.100, VRF default
Inherits configuration from and member of peer-group EXTERNAL
Negotiated BGP version 4
Member of update group 3
Last read 00:00:17, last write 00:00:18
Hold time is 180, keepalive interval is 60 seconds
Configured hold time is 180, keepalive interval is 60 seconds
Connect timer is inactive
Idle-restart timer is inactive
BGP state is Established, up for 00:05:17
Number of transitions to established: 1
Last state was OpenConfirm
Last event was RecvKeepAlive

switch#
14.5.4.104  show ip bgp not-installed

The **show ip bgp not-installed** command displays the list of non-installed routes in the RIB.

**Command Mode**
EXEC

**Command Syntax**

```
show ip bgp not-installed
```

**Example**

- This command displays the list of non-installed routes in the RIB.

```
switch#show ip bgp not-installed
BGP routing table information for VRF default
Router identifier 1.0.0.2, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
Origin codes: i - IGP, e - EGP, ? - incomplete

</table>
```

switch#
show ip bgp paths

The `show ip bgp paths` command displays all BGP AS paths in the database.

**Command Mode**

EXEC

**Command Syntax**

`show ip bgp paths [VRF_INSTANCE]`

**Parameters**

- `VRF_INSTANCE` specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

- `Refcount`: number of routes using a listed path.
- `Metric`: the path's Multi Exit Discriminator (MED).
- `Path`: the route's AS path and its origin code.

The MED (the path's external metric) provides information to external neighbors about the preferred path into an AS that has multiple entry points. Lower MED values are preferred.

**Example**

- This command displays all BGP AS paths in the switch's database.

```
switch# show ip bgp paths
Refcount Metric    Path
  6      0      64510 64505 64506 64507 i (HashID 9)
  6      0      64510 ? (HashID 8)
 12      0      65530 65531 65532 e (HashID 5)
 12      0      i (HashID 6)
  6      0      64100 64200 i (HashID 4)
 28      0      i (HashID 1)
  7      0      ? (HashID 2)
 40      0      64510 i (HashID 10)
 19      0      64510 i (HashID 7)
  2      0      i (HashID 3)
switch#
```
14.5.4.106  show ip bgp peer-group

The `show ip bgp peer-group` command displays the BGP version, address family, and group members for all BGP peer groups defined on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show ip bgp peer-group [GROUP] [VRF_INSTANCE]`

**Parameters**

- **GROUP** peer group for which command displays information. Options include:
  - `<no parameter>` command displays information for all peer groups.
  - `group_name` name of peer group for which command displays information.
- **VRF_INSTANCE** specifies VRF instances.
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

- This command displays BGP peer group information for all peer groups on the switch.

```plaintext
switch#show ip bgp peer-group
BGP peer-group is EXTERNAL
BGP version 4
Static peer-group members:
  VRF default:
    10.1.0.100, state: Connect
    Negotiated MP Capabilities:
      IPv4 Unicast: No
      IPv6 Unicast: No
      IPv4 SR-TE: No
      IPv6 SR-TE: No

BGP peer-group is INTERNAL
BGP version 4
Listen-range subnets:
  VRF default:
    10.3.0.0/24, remote AS 64500
Dynamic peer-group members:
  VRF default:
switch#
```
The `show ip bgp regexp` command displays Border Gateway Protocol (BGP) IPv4 routing-table entries that match the AS path attributes specified in the given regular expression.

**Command Mode**

EXEC

**Command Syntax**

`show ip bgp regexp as_paths [VRF_INSTANCE]`

**Parameters**

- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INSTANCE` specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

- This command displays information about the BGP IPv4 routes in the context-active VRF where the AS path is 64510.

```
switch# show ip bgp regexp ^64510$
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
    head, e - ECMP
    $ - Stale, c - Contributing to ECMP, b - backup, L = labeled-unicast
    % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST -Cluster List, LL Nexthop - Link Local Nexthop

</tbody>
</table>
```

switch#
14.5.4.108  show ip bgp summary

The `show ip bgp summary` command displays the summary of all IPv4 and IPv6 BGP neighbors based on exchanged Address Family Identifiers (AFI) and Subsequent Address Family Identifiers (SAFI) negotiations where AFI is “IP” and SAFI is “unicast” information.

**Command Mode**
EXEC

**Command Syntax**

```
show ip bgp summary [VRF_INSTANCE]
```

**Parameters**

- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**
- **BGP router identifier**: the router identifier loopback address or highest IP address.
- **Local AS Number**: AS number assigned to the switch.

**Neighbor Table Columns**
- **(First) Neighbor**: neighbor’s IP address.
- **(Second) V**: BGP version number.
- **(Third) AS**: neighbor’s AS number.
- **(Fourth) MsgRcvd**: messages received from the neighbor.
- **(Fifth) MsgSent**: messages sent to neighbor.
- **(Sixth) InQ**: messages queued from neighbor.
- **(Seventh) OutQ**: messages queued to send neighbor.
- **(Eighth) Up/Down**: period the BGP session has been established, or its current status.
- **(Ninth) State**: State of the BGP session and the number of routes received from a neighbor.

After the maximum number of routes are received, the ninth field displays `PfxRcd`, and the connection becomes Idle. Maximum number of routes is set using the `maximum paths (BGP)` command.

**Related Command**

- `show ipv6 bgp summary`

**Example**

```
switch# show ip bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
Neighbor        V  AS      MsgRcvd  MsgSent  InQ OutQ  Up/Down State  PfxRcd
PfxAcc
10.1.0.100      4  64496   1075       1083 0    0 00:04:04 Connect
10.2.0.101      4  64510   1079       1088 0    0 00:04:14 Connect
switch#
```
The `show ip bgp` command displays Border Gateway Protocol (BGP) IPv4 routing table entries. The output format depends on the command parameters:

- **data-block format** displays comprehensive information for each specified BGP routing-table entry.
- **tabular format** displays routing-table entries for the specified IPv4 addresses.

**Command Mode**
EXEC

**Command Syntax**
```
show ip bgp [FILTER] [VRF_INSTANCE]
```

**Parameters**
- **FILTER** routing-table entries to display. Options include:
  - `<no parameter>` displays all routing-table entries in tabular format.
  - `detail` displays all routing-table entries in data-block format.
  - `ipv4_addr` displays IPv4 host address in data-block format.
  - `PREFIX` displays the route information of the specified IPv4 prefix in data block format. Options include:
    - `detail` `ipv4_prefix` displays the detailed route information of specified IPv4 prefix in data block format.
    - `longer-prefixes` `ipv4_prefix` displays the route information of IPv4 prefix in tabular block format.
    - `longer-prefixes detail` `ipv4_prefix` displays the detailed route information of specified IPv4 prefix in data block format.
  - `community-list cmnty_list_name` displays BGP routes filtered by the specified community list.
  - `installed` displays the information of installed BGP routes.
  - `labeled-unicast` displays the information of labeled-unicast BGP routes only.
  - `not-installed` displays the information of BGP routes that are not installed.
- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Guidelines**
You must provide the IPv4 prefix in CIDR notation.

**Examples**
- This command displays the BGP routing table with prefix “L” flag for all BGP LU route entries.

```
switch#show ip bgp
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 100
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

switch#
```
14.5.4.110  show ip community-list

The show ip community-list command displays the BGP community lists configured on the switch.

Command Mode
EXEC

Command Syntax
show ip community-list [COMMUNITY_LIST]

Parameters
- COMMUNITY_LIST community list for which command displays information. Options include:
  - <no parameter> command displays information for all community lists.
  - listname name of the community list (text string).

Example
- This command displays the BGP paths in the switch's database.

  switch#show ip community-list hs-comm-list
  ip community-list hs-comm-list permit 0:10
  switch#
14.5.4.111  show ip extcommunity-list

The `show ip extcommunity-list` command displays the BGP extended community lists configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

```
show ip extcommunity-list [COMMUNITY_LIST]
```

**Parameters**

- COMMUNITY_LIST extended community list for which command displays information. Options include:
  - `<no parameter>` command displays information for all extended community lists.
  - `listname` command displays information for the specified extended community list.

**Example**

- This command displays information for all extended extcommunity lists on the switch.

```
switch#show ip extcommunity-list
ip extcommunity-list hs-extcomm-list permit rt 3050:20
ip extcommunity-list hs-extcomm-list permit soo 172.17.52.2:30
ip extcommunity-list hs-extcomm-list permit rt 3050:70000
switch#
```
### 14.5.4.112 `show ipv6 bgp match community`

The `show ipv6 bgp match community` command displays IPv6 Border Gateway Protocol (BGP) routing-table entries, filtered by community.

**Command Mode**
EXEC

**Command Syntax**

```
show ipv6 bgp match community \[COMM_1 ... COMM_n\] \[MATCH_TYPE\] \[INFO\] \[VRF_INSTANCE\]
```

**Parameters**

- **COMM_x** community number or name, as specified in the route map that sets the community-list number. Options include:
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.

- **MATCH_TYPE** routes are filtered based on their communities. Options include:
  - `<no parameter>` routes must match at least one community in the list.
  - `exact` route must match all communities and include no other communities.

- **INFO** type of information the command displays. Options include:
  - `<no parameter>` displays table of the routing entry-line items.
  - `detail` displays data block for each routing-table entry.

- **VRF_INSTANCE** specifies VRF instances. Options include:
  - `<no parameter>` displays routing-table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Example**

- This command displays information in data-block format for each routing-table entry with community 655:23590.

```
switch(config)#show ipv6 bgp match community 655:23590 detail
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:100:1::/64
Paths: 1 available
  64496 64497 65536
  2001:10:1::100 from 2001:10:1::100 (10.0.0.100)
  Origin IGP, metric 0, localpref 100, IGP metric 1, weight 0,
  received 01:09:29 ago, valid, external, best
  Community: 655:23590 64496:1000
  Rx SAFI: Unicast
switch(config)#
```
14.5.4.113  show ipv6 bgp peers (route type) community

The `show ipv6 bgp peers (route type) community` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The routes are filtered by community.

The `show ipv6 bgp peers (route type)` command displays the same information for routes filtered by IP addresses and prefixes.

Command Mode
EXEC

Command Syntax
```
show ipv6 bgp peers addr RTE community CM_1 [CM_2...CM_n] [MATCH] [INFO] [VRF_INST]
```

Parameters
- `addr` neighbor location (IPv6 address).
- `RTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `CM_x` community number or name, as specified in the route map that sets the community list number. The command must list at least one of the following community identifiers:
  - `GSHUT` well-known graceful shutdown community.
  - `aa:nn` AS and network number, separated by colon. Each value ranges from 1 to 4294967295.
  - `comm_num` community number. Values range from 1 to 4294967040.
  - `internet` advertises route to Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise route to any peer.
  - `no-export` advertises route only within BGP AS boundary.
- `MATCH` routes are filtered based on their communities. Options include:
  - `<no parameter>` routes must match at least one community in the list
  - `exact` route must match all communities and include no other communities.
- `INFO` type of information the command displays. Values include:
  - `<no parameter>` displays table of the routing entry line items.
  - `detail` displays data block for each routing table entry.
- `VRF_INST` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

Related Command
- `show ipv6 bgp peers`

Example
- This command lists the routes advertised to the neighbor at 2001:10:1:0::102 with the community 64496:1000.

```bash
switch# show ipv6 bgp peers 2001:10:1:0::102 advertised-routes community 64496:1000
BGP routing table information for VRF default
Router identifier 10.0.0.100, local AS number 64496
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
head, e - ECMP
```
### Routing Protocols

Origin codes: i - IGP, e - EGP, ? - incomplete

AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>
<thead>

<tbody>
<tr>
<td>2001:10:100:1::/64</td>
<td>2001:10:1::100</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>64496 64497</td>
</tr>
</tbody>
</table>

*S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast*

switch#
The `show ipv6 bgp peers` command displays information about the routes either advertised to or received from a specified IPv6 BGP neighbor. The `show ipv6 bgp peers (route type) community` command displays the same information for routes filtered by communities. Commands that do not include a route type revert to the `show ipv6 bgp peers` command.

The output format depends on the selected FILTER parameter:

- data-block format displays comprehensive information for each specified route.
- tabular format displays routing table entries in tabular format for the specified IP addresses.

Output produced by the longer-prefixes option includes the specified route and all more specific routes.

**Command Mode**

EXEC

**Command Syntax**

```
show ipv6 bgp peers neighbor_addr HOPDIRECT [FILTER] [VRF_INSTANCE]
show ipv6 bgp peers neighbor_addr [ROUTE_TYPE] HOPDIRECT [detail]
```

**Parameters**

- `neighbor_addr`: location of the neighbor.
- `ROUTE_TYPE`: filters route on route type. Options include:
  - ipv4 unicast: displays IPv4 unicast routes.
  - ipv6 unicast: displays IPv6 unicast routes.
- `HOPDIRECT`: filters route on the basis of direction from neighbor. Options include:
  - advertised-routes: displays routes advertised to the specified neighbor.
  - received-routes: displays routes received from the specified neighbor (accepted and rejected).
  - routes: displays routes received and accepted from specified neighbor.
- `FILTER`: routing table entries that the command displays. Options include:
  - <no parameter>: displays all routing table entries in tabular format.
  - detail: displays all routing table entries in data-block format.
  - `ipv6_addr`: displays the IPv6 host address in data-block format.
  - `ipv6_prefix`: displays the route information of specified IPv6 prefix in data-block format. Additional option:
    - longer-prefixes: displays the route information of IPv4 prefix in data-block format.
- `VRF_INSTANCE`: specifies VRF instances. Options include:
  - <no parameter>: displays routing table for context-active VRF.
  - vrf `vrf_name`: displays routing table for the specified VRF.
  - vrf all: displays routing table for all VRFs.
  - vrf default: displays routing table for default VRF.

**Related Commands**

- `show ipv6 bgp peers (route type) community`

**Example**

This command displays information of all routes advertised to the neighbor at 2001:10:1:0::100.

```
switch# show ipv6 bgp peers 2001:10:1:0::100 advertised-routes
```

show ipv6 bgp peers regexp

The `show ipv6 bgp peers regexp` command displays information about routes (advertised or received) from a specified IPv6 neighbor that match the AS-path attributes specified in the given regular expression.

Command Mode
EXEC

Command Syntax
`show ipv6 bgp peers addr ROUTE regexp as_paths [VRF_INST]`

Parameters
- `addr` neighbor location (IPv6 address).
- `ROUTE` type of route that the command displays. Options include:
  - `advertised-routes` displays routes advertised to the specified neighbor.
  - `received-routes` displays routes received from the specified neighbor (accepted and rejected).
  - `routes` displays routes received and accepted from specified neighbor.
- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern-matching strings that are composed of text characters and operators.
- `VRF_INST` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

Related Commands
- `show ip bgp regexp`
- `show ipv6 bgp peers`

Examples
- This command displays information for routes received from the neighbor at 2001:10:1:0::100 which include AS number 64496 in their AS paths.

```
switch# show ipv6 bgp peers 2001:10:1:0::100 received-routes regex 64496
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500

**14.5.4.116 show ipv6 bgp peers**

The `show ipv6 bgp peers` command displays IPv6 Border Gateway Protocol (BGP) and TCP session data for a specified neighbor. Command displays data for all neighbors if an address is not included.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 bgp peers [NEIGHBOR_ADDR] [VRF_INSTANCE]`

**Parameters**

- NEIGHBOR_ADDR location of the neighbors. Options include:
  - `<no parameter>` command displays information for all neighbors.
  - `ipv6_addr` command displays information for the specified neighbor.
- VRF_INSTANCE specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for the context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for the default VRF.

**Related Command**

- `show ip bgp peer-group`

**Example**

- This command displays information for the neighbor at 2001:10:1:0::100.

```
switch#show ipv6 bgp peers 2001:10:1:0::100
BGP neighbor is 2001:10:1::100, remote AS 64496, external link

switch#
14.5.4.117  show ipv6 bgp regexp

The `show ipv6 bgp regexp` command displays Border Gateway Protocol (BGP) IPv6 routing-table entries that match the AS-path attributes specified in the given regular expression.

**Command Mode**

EXEC

**Command Syntax**

`show ipv6 bgp regexp as_paths [VRF_INSTANCE]`

**Parameters**

- `as_paths` list of AS paths, formatted as a regular expression. Regular expressions are pattern matching strings that are composed of text characters and operators.
- `VRF_INSTANCE` specifies the VRF instance of the BGP routing table to be displayed. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Related Command**

- `show ip bgp regexp`

**Examples**

- This command displays information about the BGP IPv6 routes in the context-active VRF that pass through AS 64496.

```
switch# show ipv6 bgp regexp _64496_
BGP routing table information for VRF default

switch#
```
14.5.4.118 show ipv6 bgp summary

The `show ipv6 bgp summary` command displays the summary of all IPv4 and IPv6 BGP neighbors based on Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI) negotiations where AFI is “IPv6” and SAFI is “Unicast” information.

**Command Mode**
EXEC

**Command Syntax**

```
show ipv6 bgp summary [VRF_INSTANCE]
```

**Parameters**
- `VRF_INSTANCE` specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Display Values**

**Header Row**
- `BGP router identifier`: the router identifier; sloopback address or highest IP address.
- `Local AS number`: AS number assigned to switch.

**Neighbor Table Columns**
- *(First) Neighbor*: neighbor’s IP address.
- *(Second) V*: BGP version number.
- *(Third) AS*: neighbor’s AS number.
- *(Fourth) MsgRcvd*: messages received from the neighbor.
- *(Fifth) MsgSent*: messages sent to neighbor.
- *(Sixth) InQ*: messages queued from neighbor.
- *(Seventh) OutQ*: messages queued to send neighbor.
- *(Eighth) Up/Down*: period the BGP session has been Established, or its current status.
- *(Ninth) State*: state of the BGP session and the number of routes received from a neighbor.
- *(Tenth) PfxRcd*: the count of prefixes received by BGP per neighbor.
- *(Eleventh) PfxAcc*: the count of prefixes added to the BGP RIB among all received prefixes.

**Related Command**
- `show ip bgp summary`

**Example**

```
switch# show ipv6 bgp summary
BGP summary information for VRF default
Router identifier 10.0.0.102, local AS number 64500
Neighbor Status Codes: m - Under maintenance
Neighbor Status Codes: m - Under maintenance
Neighbor         V  AS         MsgRcvd  MsgSent  InQ OutQ  Up/Down State   PfxRcd PfxAcc

2001:10:2::101   4  64510      35     38     0  0 00:29:37 Estab 4  4
switch#
```

This command displays the status of the switch’s BGP connections.
14.5.4.119  show ipv6 bgp

The `show ipv6 bgp` command displays IPv6 Border Gateway Protocol (BGP) routing-table entries. The output format depends on the command parameters:

- data-block format displays comprehensive information for each specified BGP routing-table entry.
- tabular format displays routing-table entries for specified IPv6 addresses.

**Command Mode**
EXEC

**Command Syntax**
`show ipv6 bgp [FILTER] [VRF_INSTANCE]`

**Parameters**

- FILTER routing table entries that the command displays. Options include:
  - `<no parameter>` displays all routing-table entries in tabular format.
  - `detail` displays all routing-table entries in data-block format.
  - `ipv6_addr` displays IPv6 host address in data-block format.
  - `ipv6_prefix` displays the route information of specified IPv6 prefix address in data-block format. Options include:
    - `detail` displays the detailed route information of specified IPv6 prefix address in data-block format.
    - `longer-prefixes` displays the route information of IPv6 prefix in data-block format.
    - `longer-prefixes detail` displays detailed route information of specified IPv6 prefix in data-block format.
  - `community-list cmnty_list_name` displays BGP routes filtered by the specified community list.
  - `installed` displays the information of installed BGP routes.
  - `labeled-unicast` displays the information of labeled-unicast BGP routes only.
  - `not-installed` displays the information of BGP routes that are not installed.
- VRF_INSTANCE specifies VRF instances. Options include:
  - `<no parameter>` displays routing table for context-active VRF.
  - `vrf vrf_name` displays routing table for the specified VRF.
  - `vrf all` displays routing table for all VRFs.
  - `vrf default` displays routing table for default VRF.

**Guidelines**
You must provide the IPv6 prefix in CIDR notation.

**Related Command**
- `show ip bgp`

**Examples**

- This command displays the route information of 2001:10:1:0::102/64 in data-block format.

```
switch#show ipv6 bgp 2001:10:1:0::102/64
BGP routing table information for VRF default
Router identifier 10.0.0.102, local AS number 64500
BGP routing table entry for 2001:10:1::/64

switch#
14.5.4.120  show peer-filter

The `show peer-filter` command displays the definition of a peer filter.

**Command Mode**
EXEC

**Command Syntax**
`show peer-filter filter_name`

**Parameters**
- `filter_name` name of the peer-filter group.

**Example**
- This command displays the peer-filter group information for “group3.”

```
switch#show peer-filter group3
peer-filter group3
  10 match as-range 65003 result accept
  20 match as-range 65007 result accept
  30 match as-range 65009 result accept
switch#
```
14.5.4.121  show tunnel rib brief

The show tunnel rib brief command displays the preferred tunnels for various IP endpoints, optionally filtered by endpoint. Each tunnel RIB entry in the output displays the type of the tunnel (such as BGP LU) and a numerical index uniquely identifying that tunnel within the type-specific tunnel table.

Command Mode
EXEC

Command Syntax
show bgp tunnel rib brief

Example
- This command displays the tunnel type and the index value.

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>Tunnel Type</th>
<th>Indexes</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.1.1.0/32</td>
<td>BGP LU</td>
<td>2</td>
</tr>
<tr>
<td>11.1.1.0/32</td>
<td>BGP LU</td>
<td>1, 3</td>
</tr>
</tbody>
</table>

switch#
14.5.4.122 shutdown (BGP)

The `shutdown` command disables BGP on the switch without modifying the BGP configuration. The `no shutdown` and `default shutdown` commands enable the BGP instance by removing the `shutdown` command from `running-config`.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
shutdown
no shutdown
default shutdown
```

**Examples**

- These commands disable BGP on the switch.

```
switch(config)#router bgp 9
switch(config-router-bgp)#shutdown
switch(config-router-bgp)#
```

- These commands enable BGP on the switch.

```
switch(config)#router bgp 9
switch(config-router-bgp)#no shutdown
switch(config-router-bgp)#
```
14.5.4.123 peer-filter

The `peer-filter` command creates a peer filter group and places the switch in peer-filter configuration mode for that group. The peer-filter group parameters are defined using the `match as-range` command.

The `no peer-filter` and `default peer-filter` commands remove the peer-filter group from `running-config`.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```plaintext
peer-filter filter_name
no peer-filter filter_name
default peer-filter filter_name
```

**Parameters**

- `filter_name` name of the peer filter.

**Example**

- This command creates a peer filter called “group1” and places the switch in peer-filter configuration mode for that filter.

```plaintext
switch(config-router-bgp)#peer-filter group1
switch(config-peer-filter-group1)#
```
14.5.124 timers bgp

The `timers bgp` command configures the BGP keepalive and hold times. Timer settings apply to each peer connection. The `neighbor timers` command configures the times on a specified peer connection.

- **Keepalive time**: period between the transmission of consecutive keepalive messages.
- **Hold time**: period the switch waits for a keepalive or UPDATE message before it disables peering.

The hold time must be at least 3 seconds and should be three times longer than the keepalive setting.

The `no timers bgp` and `default timers bgp` commands return the time settings to their default values by removing the `timers bgp` command from `running-config`. The default values are:

- **keepalive**: 60 seconds.
- **hold time**: 180 seconds.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

**Parameters**

```plaintext
timers bgp keep_alive hold_time
no timers bgp
default timers bgp
```

- **keep_alive** keepalive period, in seconds. Values include:
  - 0 keepalive messages are not sent.
  - 1 to 3600 keepalive time (seconds).
- **hold_time** hold time. Values include:
  - 0 peering is not disabled by timeout expiry; keepalive packets are not sent.
  - 3 to 7200 hold time (seconds).

**Example**

- This command sets the keepalive time to 30 seconds and the hold time to 90 seconds.

```plaintext
switch(config)#router bgp 9
switch(config-router-bgp)#timers bgp 30 90
switch(config-router-bgp)#
```
14.5.125  update wait-for-convergence

The **update wait-for-convergence** command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

The **no update wait-for-convergence** command allows FIB updates and route advertisement irrespective of the BGP convergence state.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

update wait-for-convergence
no update wait-for-convergence
default update wait-for-convergence

**Related Commands**

- **clear ip bgp** removes learned BGP routes from the routing table, reads all routes from designated peers, and sends routes to those peers as required.
- **bgp convergence slow-peer time** configures the BGP convergence idle peer timeout value.
- **bgp convergence time** configures the BGP convergence timeout value.
- **show bgp convergence** displays information about the BGP convergence state; and other statistics about the BGP instance in either the specified VRF or all VRFs.

**Guidelines**

The initiation of BGP instance includes the following scenarios:

- the BGP instance starts for the first time after a switch is reloaded.
- the BGP instance restarts.
- all sessions are cleared by using the **clear ip bgp *** command.

Configuration changes made by using this command are effective from the next initiation of a BGP instance.

**Example**

- This command disables FIB updates and route advertisement when the BGP instance is initiated until the BGP convergence state is reached.

```
switch(config)#router bgp 9
switch(config-router-bgp)#update wait-for-convergence
switch(config-router-bgp)#
```
14.5.4.126 vrf

The `vrf` command places the switch in BGP VRF configuration mode for the specified VRF. Commands issued in this mode will override global BGP configuration for the specified VRF.

**Command Mode**

Router-BGP Configuration

**Command Syntax**

```
vrf vrf_instance
```

**Parameters**

- `vrf_instance` VRF to be configured.

**Example**

- These commands place the switch in BGP VRF configuration mode for VRF “purple.”

```
switch(config)#router bgp 9
switch(config-router-bgp)#vrf purple
switch(config-router-bgp-vrf-purple)#
```

14.6 Maintenance Mode

This section describes configuration for performing maintenance of switch elements.

This section contains these topics:

- Overview
- Maintenance Mode Elements
- Maintenance Mode Features
- Maintenance Mode Configuration
- Maintenance Mode Commands

14.6.1 Overview

Using maintenance mode, you can perform several maintenance activities such as:

- EOS image upgrade
- Initial configuration or reconfiguration of a production system
- Replacement of hardware
- Changing linecards or transceiver modules
- Replace, reattach, and reroute cables

Maintenance mode uses BGP to divert traffic away from the switch on which the maintenance tasks need to be performed, minimizing traffic impact. You can set the traffic thresholds and time limits at which the switch, or parts of the switch, is considered to be available for maintenance tasks.

Maintenance mode can be activated on a switch at boot-up or during operation. The mode provides the following benefits:

- Rerouting of traffic when the mode is activated during operation and other routes are present
- Replacement of hardware in modular systems or systems with redundant hardware

The switch is placed into maintenance mode, serviced, and then returned to normal operation.
14.6.2 Maintenance Mode Elements

Maintenance mode elements include Units, Groups of Interfaces and BGP Peers, and Profiles. Arista Network switches provide maintenance mode operations performed on a fundamental, configurable element, referred to as a Unit. Maintenance mode will quiesce a unit, which places the unit into maintenance mode by gracefully transitioning traffic away from it.

The most common maintenance mode operations such as removing from service an entire switch system or individual components of the switch, including a single linecard, interface, or BGP peer, can be achieved using minimal configuration.

14.6.2.1 Units

Units are configurable maintenance mode elements that comprise a collection of various groups. In addition, units contain policies which decide whether the member groups should be put into maintenance mode automatically upon boot. Built-in units are configured by default, such as the System unit representing the entire system. All maintenance mode operations are executed at the unit level.

An interface, interface range, and BGP peer (or peer-group) can be directly put under maintenance.

14.6.2.1.1 Built-in Units

There are various built-in units such as System and Linecard<n>. Fixed systems contain only one built-in unit called System, which comprises the interface group containing all Ethernet interfaces and sub-interfaces; and BGP groups per VRF containing all the peers in the respective VRF.

Modular Systems have both System and Linecard<n> units. Linecard<n> units are present for each linecard which comprises the Linecard<n> groups containing all Ethernet interfaces and sub-interfaces of that linecard.

14.6.2.1.2 User-configured Units

You can also configure customized units containing user-defined groups and policies as shown in the following example. A custom group called BG1 with a custom interface IG1 and a unit profile UP1 is created. The show command displays the details.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group bgp BG1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#show maintenance units
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Bgp Groups:
    AllBgpNeighborVrf-default
  Interface Groups:
    AllEthernetInterface
  Unit Name: UNIT1
  Origin: User Configured
  Status: Under Maintenance
  Unit Profile: UP1
  Time Since Last State Change: 0:00:08 ago
  Bgp Groups:
    BG1
```
14.6.2.2 Groups of Interfaces and BGP Peers

Maintenance mode group types include the groups for interfaces and BGP peers. Groups are identified by a group name unique to a particular group type.

By default, several built-in groups are available on the device such as linecard groups containing physical interfaces.

14.6.2.2.1 Built-in Groups

There are several built-in groups such as AllEthernetInterface, Linecard1, Linecard2, etc., AllBgpNeighborVrf-<vrf_name>. AllEthernetInterface is the built-in interface group which contains all physical Ethernet interfaces and sub-interfaces on the switch, and is a part of System unit.

Whereas on modulars Linercard1, Linecard2, etc., are the built-in groups which contain respective linecard interfaces and sub-interfaces; and are part of the Linecard1 and Linecard2 units respectively. AllBgpNeighborVrf-<vrf_name> is the built-in BGP group which contains all the BGP peers in that particular VRF.

14.6.2.2.2 User-defined Groups

The following set of commands sets up a custom group (IG1) of interfaces, which includes physical ports, port-channels and SVIs.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet1
switch(config-group-if-IG1)#interface Port-Channel1,20
switch(config-group-if-IG1)#interface Vlan1-20
switch(config-group-if-IG1)#exit
```

**Note:** User-defined interface groups do not contain sub-interfaces.

The following set of commands sets up a custom group (BG1) of BGP peers.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 10.0.0.1
switch(config-group-bgp-BG1)#neighbor BGP_PG1
switch(config-group-bgp-BG1)#vrf vrf1
switch(config-group-bgp-BG1)#exit
```

**Note:** BGP groups are specific to VRF.

14.6.2.3 Profiles

Profiles are configurable maintenance mode elements that define policies for related software or hardware components to carry out maintenance mode operations.

14.6.2.3.1 Default Profiles

Default profiles are the built-in policies which are applied to groups interface/BGP and unit.

The default profile is used in the absence of an explicit interface/BGP profile associated with the group, or explicit unit profile associated with the unit.
• Interface Profile
Default interface profile has rate-monitoring load-interval set to 60 seconds, threshold set to 100 kbps, and shutdown disabled as shown. The max-delay parameter is set to 300 seconds but is not enabled.

```
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: Default
Rate Monitoring:
load-interval: 60 seconds
threshold (in/out): 100 kbps
shutdown:
enabled: no
max-delay: 300 seconds
```

• BGP Profile
Default BGP profile has route-map with set clauses set community GSHUT additive and set local-preference 0.

```
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: Default
Initiator route-map: SystemGenerated
route-map SystemGenerated permit 10
Description:
description System generated initiator route-map
Match clauses:
SubRouteMap:
Set clauses:
set local-preference 0
set community GSHUT additive
```

• Unit Profile
Default unit profile has on-boot setting disabled.

```
switch(config-maintenance)#show maintenance profiles unit default
Unit Profile: Default
On-boot:
enabled: no
duration: 300 seconds
```

14.6.2.3.2 User-defined Profiles
You can define your own profiles which can be associated to groups or set as default profiles.

Interface Profile: The following set of commands sets up an Interface Profile(IP1) with load interval set to 10 seconds, rate-monitoring threshold set to 100kbps and the maximum delay for shutting down the interface set to 100 seconds. The interface will be shutdown with cause maint-down if traffic does not drain below the threshold even after the specified maximum delay period of 100 seconds.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 10
switch(config-profile-intf-IP1)#rate-monitoring threshold 100
switch(config-profile-intf-IP1)#shutdown max-delay 100
switch(config-profile-intf-IP1)#exit
switch(config-maintenance)#
```

An interface profile can be associated to only interface groups using the following set of commands.

```
switch(config)#group interface IG1
```
You can set the interface profile as the default interface profile using the following set of commands.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1 default
switch(config-maintenance)#exit
switch(config)#
```

**Bgp Profile:** The following set of commands sets up a BGP profile (BP1) with initiator route-map called RM which will be applied for both inbound and outbound directions.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM inout
switch(config-profile-bgp-BP1)#exit
switch(config-maintenance)#
```

A BGP profile can be associated to both interface and bgp groups using the following commands.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#maintenance profile bgp BP1
switch(config-group-if-IG1)#exit
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#maintenance profile bgp BP1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

You can set the bgp profile as the default bgp profile using the following set of commands.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1 default
switch(config-maintenance)#exit
switch(config)#
```

**Unit Profile:** The following set of commands sets up a Unit profile (UP1) with on-boot duration of 300 seconds. The unit will enter into maintenance mode at boot-up and exit maintenance mode at the end of 5 minutes (300sec) after boot-up.

```
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 300
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#
```

A Unit profile can be associated to a Unit using the following commands.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#
```

You can set the Unit profile as the default Unit profile using the following set of commands.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1 default
switch(config-maintenance)#exit
```
14.6.3  Maintenance Mode Features
Arista Network switches provide maintenance mode features including rate monitoring, BGP maintenance route map, on-boot maintenance, and EventMgr integration.

14.6.3.1  Rate Monitoring
Rate monitoring provides a mechanism to monitor traffic on interfaces identified for maintenance. You can set the traffic threshold and a time limit for the interface to be shutdown for maintenance tasks.

A shutdown parameter can be configured in the interface profile that signals the interface to be shutdown after it has entered maintenance mode.

The max-delay parameter specifies the maximum number of seconds to allow for traffic to dissipate from the interface before the interface is shutdown. The default interface profile settings are shown in the output of the `show maintenance profile interface default` command.

Note: The exclusive rate monitoring of sub-interfaces is not supported. Sub-interfaces inherit the interface profile from its parent interface. In case of multiple sub-interfaces configured for single parent interface, rate monitoring of parent interface include aggregate values of all respective sub-interfaces.

14.6.3.2  BGP Maintenance Route Map
Route-maps are used within a BGP maintenance profile to tag the inbound and outbound routes in order to direct traffic away from the unit.

The default profile tags the inbound and outbound routes with the global shutdown community. Other methods can be configured under the route-map such as alternate communities, or by using AS_PATH prepend operations.

14.6.3.3  On-boot Maintenance
There are two ways of placing a unit in maintenance mode on switch boot-up:

- The unit is placed into maintenance mode prior to the switch reboot, and the running-config is saved prior to switch boot-up.
- The on-boot property in the unit maintenance profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remains so for the specified duration.

Note: The duration value in the on-boot unit maintenance profile starts as soon as the unit is put into maintenance mode on boot-up.

14.6.4  Maintenance Mode Configuration
You can configure maintenance mode for the entire device, specific linecards, or any other Unit. You can set up configuration for maintenance mode for the device at boot-up or while it is running.

Note: Explicit maintenance of sub-interfaces is not supported. Sub-interfaces are put into maintenance implicitly in case of built-in unit maintenance and interface maintenance but not in case of user-configured units.

14.6.4.1  Unit (System, Linecardn, etc.) Configuration
Arista Network switches provide the ability to place the switch in maintenance mode, and configuration options for groups, profiles, associating profiles with groups, units, and maintenance mode operations. System is a predefined (built-in) unit on all switches. Built-in groups include AllEthernetInterface,
**AllBgpNeighborVRF-<vrf_name>**, and **Linecardn**. **Linecardn** can also be a built-in unit and can be differentiated depending on the command being used as shown.

- `switch(config-maintenance)#unit Linecardn`
- `switch(config)#group interface Linecardn`

Built-in unit **System** comprises the following groups:

- **AllEthernetInterface** - a built-in interface group which contains all physical Ethernet interfaces on the switch on a fixed system
- **Linecardn** - a built-in interface group which contains all interfaces for the linecard numbered n for modular systems
- **AllBgpNeighborVRF-<vrf_name>** - a built-in BGP group which contains all the BGP peers in the named VRF.

For each Linecard n, there is a built-in unit which consists of all the **Linecardn** groups.

By default, the default interface and BGP profiles are applied to the built-in interface and BGP groups and the default built-in unit profile is applied to the built-in unit. You can also configure your own profiles and choose a default.

In the following example, traffic is flowing through multiple switches in the spine to and from one switch to another, when you elect to put one of the Units (entire switch or parts thereof) in the spine switch in maintenance mode. The traffic is then gracefully steered away from the Unit, provided other paths are available. Traffic will continue to flow through the Unit placed into maintenance mode, if no other path is available.

**Example**

> **Note:** The illustration shows an entire switch as the Unit. You can replace switch with **Linecardn** or another relevant Unit as appropriate.

![Figure 59: Traffic flow pattern between TOR and Core Before Maintenance](image-url)
You can see the status of the Unit (System) using the `show maintenance units System` command for the example above before the system is placed into maintenance mode. If the device being placed into maintenance mode is modular and the Unit is a linecard, replace the argument `System` with `Linecardn` to see the status of the Unit (Linecardn).

```
switch(config)# show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Bgp Groups:
    AllBgpNeighborVrf-default
  Interface Groups:
    AllEthernetInterface
```

You can then place the Unit (System) into maintenance mode and recheck the status using the sequence of commands shown.

```
switch(config-maintenance)# unit System
switch(config-built-in-unit-System)# quiesce
switch(config-built-in-unit-System)# exit
switch(config-maintenance)# show maintenance
Flags:
  o - On-boot maintenance
  v - Violating traffic threshold

Unit Name                  Status                   Time since last change
---------------------- ----------------------- --------------------------
-----
System                  Under Maintenance              0:02:03 ago
```

```
switch(config-maintenance)# show ip bgp summary
BGP summary information for VRF default
Router identifier 1.1.1.1, local AS number 101
Neighbor Status Codes: m - Under maintenance

  Neighbor   V  AS  MsgRcvd  MsgSent  InQ  OutQ  Up/Down
  PfxRcd  PfxAcc
m 1.1.1.2    4  100       24   17     0    0    00:00:40
Estab  5
m 3.3.3.33    4  102       15   16     0    0    00:06:23
Estab  1
```
Note: The 'o' flag is shown for on-boot maintenance in the show maintenance command and the 'm' neighbor status flag in the show ip bgp summary command indicates that the peer is in maintenance mode.

14.6.4.2 On-boot Maintenance Mode Configuration

To configure on-boot maintenance, you can use one of two methods:

- Use quiesce config or
- Use on-boot profile

14.6.4.2.1 Using quiesce config

You must perform the following tasks to place the Unit in maintenance mode on boot-up using the quiesce command.

1. Place the unit into maintenance mode prior to switch reboot using the following commands.

```
switch(config)#maintenance
switch(config-maintenance)#unit System
switch(config-unit-System)#quiesce
switch(config-unit-System)#exit
switch(config-maintenance)#show maintenance
Flags:
  o - On-boot maintenance
  v - Violating traffic threshold
Unit Name Status Time since last change Flags
---------------------- ----------------------- -------------
------------- ----- 
System Under Maintenance 00:01:10 ago
```

2. Save the running-config using the following command.

```
switch(config)#copy running-config startup-config
Copy completed successfully
```

3. Reload the device.

```
switch(config)#reload
Proceed with reload? [Confirm] Yes
Connection to switch closed.
```

After the device comes up, you must execute the no quiesce command for the Unit to come out of maintenance mode. You can check the status of the device after it comes up using the show maintenance command.

```
switch#show maintenance
Flags:
  o - On-boot maintenance
  v - Violating traffic threshold
Unit Name Status Time since last change Flags
---------------------- ----------------------- -------------
------------- ----- 
System Under Maintenance 00:03:10 ago
```
### 14.6.2.2 Using on-boot profile

The on-boot property in the Unit maintenance profile specifies that the Unit will be placed into maintenance mode as part of boot-up for the specified duration. You must perform the following tasks to use this method.

1. **Check to see if the on-boot maintenance mode is enabled using the `show maintenance profiles unit default` command.**

   ```
   switch# show maintenance profiles unit default
   Unit Profile: Default
   On-boot:
   enabled: no
duration: 300 seconds
   ```

2. **Configure an on-boot profile with on-boot enabled and a duration specified. Make this the default Unit profile. The following code example shows the creation of an on-boot duration of 300 seconds in the profile unit UP1.**

   ```
   switch(config)# maintenance
   switch(config-maintenance)# profile unit UP1
   switch(config-profile-unit-UP1)# on-boot duration 300
   switch(config-profile-unit-UP1)# exit
   switch(config-maintenance)# profile unit UP1 default
   switch(config-maintenance)# show maintenance profiles unit default
   Unit Profile: UP1
   On-boot:
   enabled: yes
duration: 300 seconds
   ```

3. **Save the running-config and reload the device.**

   ```
   switch(config)# copy running-config startup-config
   Copy completed successfully
   switch(config)# reload
   Connection to switch closed.
   ```

4. **After the device comes up, execute the `show maintenance` and `show maintenance units System` commands.**

   ```
   switch(config)# show maintenance
   Flags:
o - On-boot maintenance
v - Violating traffic threshold
Unit Name Status Time since last change Flags
---------------------- ------------------------ --------------
------------- ----- 
System Under Maintenance 00:00:08 ago o 
switch(config)# show maintenance units System
Unit Name: System
Origin: Built-in
Status: Under Maintenance (on-boot)
Unit Profile: UP1
Time Since Last State Change: 0:00:16 ago
Will come out of on-boot Maintenance after 0:04:43
Interface Groups:
AllEthernetInterface
History:
2017-01-18 00:44:39 old state: 'maintenanceModeEnter' to new state: 'underMaintenance' 0:00:16 ago
2017-01-18 00:43:54 old state: 'active' to new state: 'maintenanceModeEnter'
```
0:01:01 ago

The o - flag shows that unit System is under maintenance due to on-boot profile. Also, show maintenance units System output shows the following - Will come out of on-boot Maintenance after 0:04:43, which is the time remaining of the specified duration of 5 minutes.

The Unit will come up in maintenance mode when the device boots up and will exit maintenance mode once the specified duration of 300 seconds in the default profile is completed. The BGP sessions will remain under maintenance for the duration and will resume after the specified duration is over.

14.6.4.3 Interface-level Maintenance Mode Configuration

To configure the maintenance mode at interface-level, you must perform the following tasks:

1. Configure an interface-level profile (or use a pre-configured one). The following code example creates a user-defined interface profile IP1 with a rate-monitoring load-interval of 100 seconds, a rate-monitoring threshold of 500 kbps and a maximum shutdown delay of 100 seconds.

   ```
   switch(config)#maintenance
   switch(config-maintenance)#profile interface IP1
   switch(config-maint-if-Et5)#rate-monitoring load-interval 100
   switch(config-maint-if-Et5)#rate-monitoring threshold 500
   switch(config-maint-if-Et5)#shutdown max-delay 100
   ```

2. Make the user-defined interface profile IP1 as the default interface profile.

   ```
   switch(config-maintenance)#profile interface IP1 default
   ```

3. Place the interface into maintenance mode.

   ```
   switch(config)#maintenance
   switch(config-maintenance)#interface Ethernet 1
   switch(config-maint-if-Et1)#quiesce
   ```

4. Remove the interface from maintenance mode once the service has been performed.

   ```
   switch(config-maintenance)#interface Ethernet 1
   switch(config-maint-if-Et1)#no quiesce
   ```

   Note: If interface Et1 has sub-interfaces (Et1.1, Et1.2,...) with BGP peers on these sub-interfaces, then these sub-interfaces are also placed into maintenance mode. The show maintenance interface <sub-interface> detail command displays the maintenance state of sub-interfaces.

14.6.4.4 Entering Maintenance Mode

Enter configuration commands unit and quiesce using the maintenance profile bgp mode command to place the switch into maintenance mode. The following code sequence places unit foo, the interface 3/3, and BGP 1.1.1.1 in maintenance mode.

Example

```
switch(config)#maintenance
switch(config-maintenance)#unit foo
switch(config-unit-foo)#quiesce
switch(config-unit-foo)#exit
switch(config-maintenance)#interface ethernet 3/3
switch(config-maint-if-Et3/3)#quiesce
switch(config-unit-if-Et3/3)#exit
```
14.6.4.5 Exiting Maintenance Mode

Enter configuration commands `unit` and `no quiesce` using the `maintenance profile bgp` mode command for the switch to exit maintenance mode. The following code sequence causes unit foo, the interface 3/3, and BGP 1.1.1.1 to exit maintenance mode.

Example

```
switch(config)#maintenance
switch(config-maintenance)#unit foo
switch(config-unit-foo)#no quiesce
switch(config-unit-foo)#exit
switch(config-maintenance)#interface ethernet 3/3
switch(config-maint-if-Et3/3)#quiesce
switch(config-unit-if-Et3/3)#exit
switch(config-maintenance)#bgp 1.1.1.1
switch(config-maint-bgp-1.1.1.1)#no quiesce
switch(config-maint-bgp-1.1.1.1)#exit
```

14.6.4.6 Configuring Event Handlers

Enter configuration options for the `show maintenance` command to fire at different stages while entering or exiting maintenance mode.

Example for Maintenance Mode Event Handler for all Stages

```
switch(config)#event-handler foo
switch(config-handler-foo)#trigger on-maintenance enter unit unit-foo all
switch(config-handler-foo)#action bash /mnt/flash/mm-event-handler-script
switch(config-handler-foo)#timeout 20
switch(config-handler-foo)#exit
```

Note: The user is expected to configure the timeout value. This is time within which the script should complete execution and exit. If the script has not exited by the end of this period, then the following will occur:

1. Send the SIGUSR1 signal to the script.
2. Wait for a GRACE-PERIOD of 10 seconds for the script to exit.
3. If the script does not exit even after that GRACE-PERIOD, then send a SIGKILL to the script.
4. The maintenance operation progresses to the next stage.

GRACE-PERIOD is not configurable.

```
switch(config)#event-handler bar
switch(config-handler-bar)#trigger on-maintenance exit unit unit-foo before stage ratemon
switch(config-handler-bar)#action bash /mnt/flash/mm-event-handler-script
switch(config-handler-bar)#exit
```
14.6.4.7 Configuring Groups

Enter the maintenance mode configuration options for groups with the `maintenance` and `group bgp` commands.

**Example for group interface IG1**

```
switch(config)# group interface IG1
switch(config-group-if-IG1)# interface Ethernet1
switch(config-group-if-IG1)# interface Port-Channel1,20
switch(config-group-if-IG1)# interface Vlan1-20
switch(config-group-if-IG1)# exit
switch(config)#
```

**Example for group bgp BG1**

```
switch(config)# group bgp BG1
switch(config-group-bgp-BG1)# neighbor 10.0.0.1
switch(config-group-bgp-BG1)# neighbor BGP_PG1
switch(config-group-bgp-BG1)# vrf vrf1
switch(config-group-bgp-BG1)# exit
switch(config)#
```

> **Note:** BGP groups are specific to VRF.

14.6.4.8 Configuring Profiles

Enter the maintenance mode configuration options for profiles with the `profile interface`, `rate-monitoring threshold`, `profile bgp`, and `profile unit <profile_name>` commands.

These command examples assign a user configured profile as the `default` profile.

**Example for profile interface IP1**

```
switch(config)# maintenance
switch(config-maintenance)# profile interface IP1
switch(config-profile-intf-IP1)# rate-monitoring load-interval 10
switch(config-profile-intf-IP1)# rate-monitoring threshold 100
switch(config-profile-intf-IP1)# shutdown max-delay 100
switch(config-profile-intf-IP1)# profile interface IP1 default
switch(config-profile-intf-IP1)# exit
switch(config-maintenance)#
```

**Example for profile bgp BP1**

```
switch(config-maintenance)# profile bgp BP1
switch(config-profile-bgp-BP1)# initiator route-map rmap inout
switch(config-profile-bgp-BP1)# profile bgp BP1 default
switch(config-profile-bgp-BP1)# exit
switch(config-maintenance)#
```
**Example for profile unit UP1**

```bash
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 300
switch(config-profile-unit-UP1)#profile unit UP1 default
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#
```

14.6.4.9 **Associating Profiles with Groups**

Enter the maintenance mode configuration options for associating profiles with groups using the `maintenance` and `group bgp` command.

**Example**

```bash
switch(config)#group interface IG1
switch(config-group-if-IG1)#maintenance profile bgp BP1
switch(config-group-if-IG1)#maintenance profile interface IP1
switch(config-group-if-IG1)#
```

**Note:** An interface/BGP profile can be associated with the interface group, and a BGP profile can be associated with the BGP group.

14.6.4.10 **Configuring Units**

Enter the maintenance mode configuration options for units using the `unit`, `group bgp`, and `maintenance` commands.

**Example**

```bash
switch(config)#maintenance
switch(config-maintenance)#unit foo
switch(config-unit-foo)#group bgp BG1
switch(config-unit-foo)#group interface IG1
switch(config-unit-foo)#profile unit UP1
```

14.6.5 **Show Commands**

Maintenance mode show commands display general and detailed information associated with maintenance mode.

14.6.5.1 **show maintenance example**

This example of the `show maintenance` command displays maintenance mode details.

**Example**

```bash
switch(config)#show maintenance
Flags:
  o - On-boot maintenance
  v - Violating traffic threshold
Unit Name Status Time since last change Flags
---------------------- ----------------------- --------------------------
-----
System Not Under Maintenance never
Foo Under Maintenance 0:00:14 ago ov
Interface Name Status Time since last change Flags
```
Routing Protocols

---

**4.6.5.2 show maintenance summary example**

This example of the `show maintenance summary` command displays a summary of maintenance mode information.

**Example**

```
switch(config)#show maintenance summary
Number of Units configured: 3
Number of Units not under maintenance: 2
Number of Units entering maintenance: 1
Number of Units under maintenance: 0
Number of Units exiting maintenance: 0
Directly Put Under Maintenance:
  Number of interfaces entering maintenance: 0
  Number of interfaces under maintenance: 2
  Number of bgp peers entering maintenance: 0
  Number of bgp peers under maintenance: 3
Rate Monitoring:
  Number of interfaces entering maintenance: 0
  Number of interfaces under maintenance: 4
  Number of interfaces under maintenance with threshold violation: 0
  Number of interfaces shutdown for maintenance: 0

switch(config)#
```

**4.6.5.3 show maintenance units example**

This example of the `show maintenance units` command displays maintenance mode units details.

**Example**

```
switch(config)#show maintenance units
Unit Name: Linecard3
Origin: User Configured
Status: Under Maintenance
Unit Profile: Default
Time Since Last State Change: 0:12:07 ago
Interface Groups:
  IG1
Interface Traffic Threshold violations:
  Current violations: 1
  Et1
Total violations, during maintenance: 5
History:
```

---
show maintenance bgp example

This example of the `show maintenance bgp` command displays maintenance mode BGP details for all IPs and VRFs.

Example

```
switch(config)# show maintenance bgp ip all vrf all
BGP peer maintenance information for VRF default
Router identifier 2.2.2.1, local AS number 1
Neighbor: 2.2.2.2
Maintenance State: Not Under Maintenance
BGP peer maintenance information for VRF red
Router identifier 6.6.6.1, local AS number 1
Neighbor: 1.1.1.2
Maintenance State: Not Under Maintenance
Router identifier 2.2.2.1, local AS number 1
Neighbor: 2.2.2.2
Maintenance State: Not Under Maintenance
Maintenance route-map: SystemGenerated
route-map SystemGenerated permit 10
Description:
Match clauses:
Set clauses:
set community GSHUT additive
set local-preference 0
Selected profile from BGP groups: Default
```

show maintenance interface example

This example of the `show maintenance interface status` command displays maintenance mode interface details.

Example

```
switch(config)# show maintenance interface
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface Status In Out Flags
```

```
2572
```
Routing Protocols

14.6.5.6  show maintenance interface status quiesced

This example of the `show maintenance interface status quiesced` command displays maintenance mode interface status details for quiesced interfaces.

Example

```
switch(config)# show maintenance interface status quiesced
Flags:
 v - Violating traffic threshold
 s - Shutdown for maintenance
Rate (Mbps)
Interface Status In Out Flags
------------------------ ------------------------ ----------- -----------
Ethernet1 Under Maintenance 0.3 0.0 v
Ethernet2 Under Maintenance 0.0 0.0
Ethernet4 Under Maintenance 0.0 0.0
```

14.6.5.7  show maintenance groups example

This example of the `show maintenance groups` command displays maintenance mode group details.

Example

```
switch(config)# show maintenance groups
Interface Group: IG1
  Interfaces:
    Et4-6
  Profiles:
    Interface Profile: IP1
      Units: newEt
    Bgp Group: BG
      Neighbors:
        IPv4 Peers: 4.4.4.2, 1.1.1.2, 3.3.3.2
        IPv6 Peers: 3::3
      Bgp Profile: prepend
      Units: newBG
```

14.6.5.8  show maintenance profiles example

This example of the `show maintenance profiles` command displays maintenance mode profile details.
Example

```
switch(config) show maintenance profiles
Interface Profile: INTFPROFILE
Rate Monitoring:
  load-interval: 444 seconds
  threshold (in/out): 4000 Kbps
shutdown:
  enabled: yes
  max-delay: 399 seconds
Bgp Profile: BGPPROFILE
Initiator route-map:
  name: rm
Unit Profile: UNITPROFILE
On-boot:
  enabled: yes
  duration: 340 seconds
```

```
switch(config)#
```

### 14.6.5.9 show interface status

This example of the `show interface <intf_name> status` command displays maintenance mode information for interfaces.

Example

```
switch(config)# show interface status
Port Name Status Vlan Duplex Speed Type Flags
Et1 connected 1 full 10G EbraTestPhyP mv
Et2 connected 1 full 10G EbraTestPhyP m
Et3 maint-down 1 full 10G EbraTestPhyP m
Et4 maint-down 1 full 10G EbraTestPhyP m
Et5 connected 1 full 10G EbraTestPhyP
Et6 connected 1 full 10G EbraTestPhyP
```

```
switch(config)#
```

### 14.6.5.10 show interface ethernet

This example of the `show interface ethernet` command displays maintenance mode information for an ethernet interface.

Example

```
switch(config)# show interface ethernet 4
Ethernet4 is down, line protocol is down (maint-down)
Hardware is Ethernet, address is 0000.0101.0004 (bia 0000.0101.0004)
Ethernet MTU 9214 bytes, BW 10000000 kbit
Full-duplex, 10Gb/s, auto negotiation: off, uni-link: unknown
Down 18 minutes, 39 seconds
Under maintenance for 18 minutes, 42 seconds
2 link status changes since last clear
Last clearing of "show interface" counters never
5 minutes input rate 0 bps (0.0% with framing overhead), 0 packets/sec
5 minutes output rate 0 bps (0.0% with framing overhead), 0 packets/sec
0 packets input, 0 bytes
Received 0 broadcasts, 0 multicast
0 runts, 0 giants
0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
```

```
```
14.6.5.11 show ip bgp neighbors

This example of the show ip bgp neighbors command displays IP BGP neighbors maintenance mode details.

Example

```plaintext
switch(config)#show ip bgp neighbors 1.1.1.2
BGP neighbor is 1.1.1.2, remote AS 1, external link ...
Prefix statistics:
Sent Rcvd
IPv4 prefixes: 0 0
IPv6 prefixes: 0 0
Inbound route map is foo
Outbound route map is foo
Session is under maintenance
Maintenance-mode:
Inbound and Outbound policy
Route map is SystemGenerated
```

switch(config)#

14.6.5.12 show ip bgp summary

This example of the show ip bgp summary command displays maintenance mode information for IP BGP.

Example

```plaintext
switch(config)#show ip bgp summary
BGP summary information for VRF default
Router identifier 192.168.201.13, local AS number 100
Neighbor Status Codes: m - Under maintenance
Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
m 1.0.0.1 4 300 983 988 0 0 16:16:03 Estab 1 1
1.0.1.1 4 300 983 983 0 0 16:15:58 Estab 1 1
```

switch(config)#

14.6.5.13 show maintenance stages example

These examples of the show maintenance stages command display maintenance mode stages details.

Example

```plaintext
switch(config)#show maintenance stages
```

switch(config)
### Maintenance Enter Stage Sequence

<table>
<thead>
<tr>
<th>No.</th>
<th>Stage Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>bgp BGP Maintenance processing</td>
</tr>
<tr>
<td>2</td>
<td>ratemon Interface Rate Monitoring</td>
</tr>
</tbody>
</table>

### Maintenance Exit Stage Sequence

<table>
<thead>
<tr>
<th>No.</th>
<th>Stage Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ratemon Interface Rate Monitoring</td>
</tr>
<tr>
<td>2</td>
<td>bgp BGP Maintenance processing</td>
</tr>
</tbody>
</table>

```
switch(config)#
```

### Example

```
switch(config)# show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
    description System generated receiver route-map
  Match clauses:
    match community GSHUT-LIST
  SubRouteMap:
  Set clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
  SubRouteMap:
  Set clauses:
tg232(s1)(config)# show maintenance profiles interface
tg232(s1)(config)# show maintenance profiles bgp
tg232(s1)(config)# show maintenance profiles unit
tg232(s1)(config)# show maintenance profiles unit default
```

#### Unit Profile: Default
- On-boot:
  - enabled: no
  - duration: 300 seconds
```
switch(config)#
```

### Example

```
switch(config)# show maintenance profiles interface default
```

#### Interface Profile: Default
- Rate Monitoring:
  - load-interval: 60 seconds
  - threshold (in/out): 100 Kbps
- shutdown:
  - enabled: no
  - max-delay: 300 seconds
```
switch(config)#
```

### Example

```
switch(config)# show maintenance profiles bgp default
```

#### Bgp Profile: Default
- Initiator route-map: SystemGenerated
  route-map SystemGenerated permit 10
  Description:
description System generated initiator route-map
Match clauses:
SubRouteMap:
Set clauses:
  set local-preference 0
  set community GSHUT additive
switch(config)#

Example

switch(config)#show maintenance profiles unit default
Unit Profile: Default
  On-boot:
    enabled: no
    duration: 300 seconds
switch(config)#

14.6.6 Syslog Messages

Maintenance mode syslog messages are as follows:

- MaintenanceMode: %MMODE-4-MAINT_OP_WARNING: Unit config is deleted for unit foo. The unit is still undergoing maintenance operation.
- MaintenanceMode: %ETH-6-MAINTENANCE_DOWN: Interface Et1 has been shutdown for maintenance.
- MaintenanceMode: %MMODE-5-INTF_PROFILE_CHANGE: For interface Et1 interface profile changed to IP1.
- Rib: %BGP-6-MAINTENANCE-MODE: peer 1.1.1.1 is placed under maintenance.
- Rib: %BGP-6-MAINTENANCE-MODE: peer 1.1.1.1 is taken out of maintenance.
14.6.7 Maintenance Mode Commands

Global Configuration Commands
• group bgp
• group interface
• maintenance

Group Configuration Commands
• interface
• maintenance profile bgp
• maintenance profile interface
• neighbor
• vrf

Maintenance Configuration Commands
• bgp <peer> [vrf <vrf_name>]
• interface
• profile bgp
• profile unit <profile_name> default
• profile interface
• profile interface <profile_name> default
• profile unit
• profile unit <profile_name> default
• unit

Unit Configuration Commands
• group bgp <group_name>
• group interface <group_name>
• profile unit
• quiesce

Interface Profile Configuration Commands
• rate-monitoring load-interval
• rate-monitoring threshold
• shutdown max-delay

BGP Profile Configuration Commands
• initiator route-map <route-map-name> inout

Unit Profile Configuration Commands
• on-boot duration

EventMgr Configuration Commands
• trigger on-maintenance
Display Commands

- show maintenance
- show maintenance bgp
- show maintenance bgp receiver route-map
- show maintenance debug
- show maintenance groups
- show maintenance interface
- show maintenance interface status
- show maintenance profiles
- show maintenance stages
- show maintenance summary
- show maintenance units

Enhanced Commands to show Maintenance Status

- show interface
- show interface <intf_name> status
- show ip | ipv6 bgp
- show ip | ipv6 bgp summary [ vrf <vrf_name> ]
14.6.7.1  bgp <peer> [vrf <vrf_name>]

The `bgp <peer> [vrf <vrf_name>]` command places the switch in maintenance dynamic BGP unit configuration mode. If no VRF is specified, the BGP peer is considered to be in the DEFAULT VRF, otherwise, in the specified VRF.

The command creates the dynamic BGP unit if the specified dynamic BGP unit does not exist prior to issuing the command.

The `no bgp <peer> [vrf <vrf_name>]` and `default bgp <peer> [vrf <vrf_name>]` removes the dynamic BGP unit from `running-config`.

Command Mode

Maintenance Configuration

Command Syntax

`bgp ipv4_addr [vrf <vrf_name>]`

`bgp ipv6_addr [vrf <vrf_name>]`

`bgp peer_group_name [vrf <vrf_name>]`

`<no | default> bgp ipv4_addr|ipv6_addr|peer_group_name [vrf <vrf_name>]`

Parameters

- `ipv4_addr` BGP neighbor IPv4 address
- `ipv6_addr` BGP neighbor IPv6 address
- `peer_group_name` BGP peer group name
- `vrf_name` name of the VRF to which the BGP peer belongs

Commands available in maintenance dynamic interface unit configuration mode:

- `quiesce`

Example

- This command creates dynamic BGP unit for IPv4 addr 1.0.1.1, IPv6 addr 1::1 with quiesce and peer-group PG in VRF VRF1 under maintenance configuration.

```
switch(config)#maintenance
switch(config-maintenance)#bgp 1.0.1.1
switch(config-maint-bgp-1.0.1.1)#exit
switch(config-maintenance)#bgp 1::1
switch(config-maint-bgp-1::1)#quiesce
switch(config-maint-bgp-1::1)#exit
switch(config-maintenance)#bgp PG vrf VRF1
switch(config-maint-bgp-PG)#exit
switch(config-maint-bgp-PG)#show active maintenance
  bgp 1.0.1.1
  !
  bgp 1::1
    quiesce
  !
  bgp PG vrf VRF1
switch(config-maintenance)#
```
14.6.7.2  group bgp <group_name>

The `group bgp <group_name>` command adds a BGP group to a unit.

The `no group bgp <group_name>` and `default group bgp <group_name>` removes the BGP group from a unit.

**Command Mode**

Maintenance Unit Configuration

**Command Syntax**

```
group bgp group_name
no group bgp group_name
default group bgp group_name
```

**Parameters**

- `group_name` name of the BGP group

**Example**

- This command adds a BGP group BG1 to unit UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group bgp BG1
switch(config-unit-UNIT1)#show active maintenance
  unit UNIT1
group bgp BG1
switch(config-unit-UNIT1)
```
14.6.7.3  group bgp

The `group bgp <group_name>` command places the switch in group-BGP configuration mode for configuring the members of a BGP group in a particular VRF and associating a BGP maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command.

The `no group bgp <group_name>` and `default group bgp <group_name>` removes the BGP group.

Command Mode
Global Configuration

Command Syntax

```plaintext
group bgp group_name
no group bgp group_name
default group bgp group_name
```

Parameters
- `group_name` name of the BGP group

Commands available in group-BGP configuration mode:
- `neighbor (ipv4 address | ipv6 address | peer-group)`
- `vrf (vrf-name)`
- `maintenance profile bgp`

Note: Built-in BGP groups like `AllBgpNeighborVrf-default` and `AllBgpNeighborVrf-vrf_name` do not allow neighbor configuration. Only BGP maintenance profile can be associated to them.

Example
- This command creates a BGP group BG1 and enters into group BGP BG1 configuration mode.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#show active
group bgp BG1
exit
switch(config-group-bgp-BG1)#
```

- This command enters into BGP built-in configuration mode for `AllBgpNeighborVrf-default`.

```
switch(config)#group bgp AllBgpNeighborVrf-default
switch(config-built-in-group-bgp-AllBgpNeighborVrf-default)#show active
group bgp AllBgpNeighborVrf-default
exit
switch(config-built-in-group-bgp-AllBgpNeighborVrf-default)#exit
switch(config)#show maintenance groups bgp AllBgpNeighborVrf-default
BGP Group: AllBgpNeighborVrf-default
Origin: Built-in
Neighbors:
  Ipv4 Peers: 1.0.0.1, 1.0.1.2
Bgp Profile: Default
Vrf: default
Units: System
switch(config)#
```
14.6.7.4  group interface <group_name>

The `group interface <group_name>` command adds an interface to a unit.

The `no group interface <group_name>` and `default group interface <group_name>` removes the interface group from a unit.

**Command Mode**

Maintenance Unit Configuration

**Command Syntax**

```
group interface group_name
no group interface group_name
default group interface group_name
```

**Parameters**

- `group_name` name of the interface group

**Example**

- This command adds an interface group IG1 to unit UNIT1.

```
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)# show active
maintenance
    unit UNIT1
    group interface IG1
switch(config-unit-UNIT1)
```
14.6.7.5 group interface

The **group interface** command places the switch in group-intf configuration mode for configuring the members of interface group and associating a BGP/interface maintenance profile for these members.

The command creates the group if the specified group does not exist prior to issuing the command. The **no group interface <group_name>** and **default group interface <group_name>** removes the interface group.

**Command Mode**

Global Configuration

**Command Syntax**

```
group interface group_name
no group interface group_name
default group interface group_name
```

**Parameters**

- `group_name` name of the interface group

**Commands available in group-BGP configuration mode:**

- `interface`
- `maintenance profile bgp`
- `maintenance profile interface`

⚠️ **Note:** Built-in Interface groups like **AllEthernetInterface, Linecard3, Linecard4**, etc. do not allow interface configurations. Only BGP/interface maintenance profiles can be associated to them.

**Example**

- This command creates an interface group IG1 and enters into group interface IG1 configuration mode.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#show active
group interface IG1
exit
switch(config-group-if-IG1)#
```

- This command enters into built-in interface group **AllEthernetInterface**.

```
switch(config)#group interface AllEthernetIntetrface
switch(config-builtin-group-if-AllEthernetInterface)#show active
group interface AllEthernetInterface
exit
switch(config-builtin-group-if-AllEthernetInterface)#exit
```

```
Interface Group: AllEthernetInterface
Origin: Built-in
Interfaces:
Et1, Et2, Et3, Et4, Et5/1, … Et34, Et35, Et36
Profiles:
Interface Profile: Default
Bgp Profile: Default
Units: System#
```
initiator route-map <route-map-name> inout

The **initiator route-map <route-map-name> inout** command is a maintenance BGP profile configuration option for assigning the initiator route-map, which will be applied to inout (inbound and outbound).

The **no initiator route-map <route-map-name> inout** and **default initiator route-map <route-map-name> inout** removes this configuration from the BGP profile.

**Command Mode**

Maintenance-Profile-BGP Configuration

**Command Syntax**

initiator route-map route-map-name inout

no initiator route-map

default initiator route-map

**Parameters**

- *route-map-name* initiator route-map name

**Example**

- This command configures initiator route-map RM1 within a BGP profile BP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM1 inout
switch(config-profile-bgp-BP1)#show active
  maintenance
    profile bgp BP1
      initiator route-map RM1 inout

switch(config-profile-bgp-BP1)#
```
14.6.7.7  interface intf-name

The interface <intf-name> command places the switch in maintenance dynamic interface unit configuration mode.

The command creates the dynamic interface unit if the specified dynamic interface unit does not exist prior to issuing the command.

The no interface <intf-name> and default interface <intf-name> removes the dynamic interface unit from running-config.

Command Mode
Maintenance Configuration

Command Syntax
interface interface-name
no interface interface-name
default interface interface-name

Parameters
• interface-name name of the interface
• ethernet e_range Ethernet interfaces specified by e_range
• port-channel p_range port channel interfaces specified by p_range
• vlan v_range vlans specified by v_range.

Valid e_range, p_range and v_range formats include number, range, or comma-delimited list of numbers and ranges.

Note: Different dynamic interface units are created for each interface in the range.

Commands available in maintenance dynamic interface unit configuration mode:
• quiesce

Example
• This command creates two dynamic interface units for interfaces Ethernet1-2 under maintenance configuration.

```
switch(config)#maintenance
switch(config-maintenance)#interface Ethernet1-2
switch(config-maint-if-Et1-2)#exit
switch(config-maintenance)#show active
maintenance
   interface Ethernet1
!
   interface Ethernet2
switch(config-maintenance)#
```
14.6.7.8 interface

The `interface` command adds interfaces to interface group.

The `interface <intf-name>` and `default interface <intf-name>` removes the interface from the group.

**Command Mode**

Group-Interface Configuration

**Command Syntax**

```
interface interface-name
no interface interface-name
default interface interface-name
```

**Parameters**

- `interface-name` name of the interface
- `ethernet e_range` Ethernet interfaces specified by `e_range`
- `port-channel p_range` port channel interfaces specified by `p_range`
- `vlan v_range` vlans specified by `v_range`.

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

**Example**

- This command adds Ethernet8, Ethernet9, and port-channel10 to the interface group IG1.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#interface port-channel10
switch(config-group-if-IG1)#show active
group interface IG1
interface Et8-9
interface Po10
switch(config-group-if-IG1)#exit
switch(config)#
```
14.6.7.9 maintenance profile bgp

The `maintenance profile bgp <profile-name>` command associates a BGP maintenance profile to an interface/BGP group. A BGP profile can be associated to both the interface and BGP group.

The `no maintenance profile bgp <profile-name>` and `default maintenance profile bgp <profile-name>` removes the profile from the interface/BGP group.

Command Mode

Group-Interface Configuration
Group-BGP Configuration
Built-in-Group-Interface Configuration
Built-in-Group-BGP Configuration

Command Syntax

```
maintenance profile bgp profile-name
no maintenance profile bgp profile-name
default maintenance profile bgp profile-name
```

Parameters

- `profile name` name of the BGP profile

Example

- This command adds BGP profile BP1 to a BGP group BG1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#maintenance profile bgp BP1
switch(config-group-bgp-BG1)#show active
  group bgp BG1
  neighbor 1.0.1.1
  neighbor 1::1
  neighbor PG
  maintenance profile bgp BP1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

- This command adds BGP profile BP1 to interface group IG1.

```
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#maintenance profile bgp BP1
switch(config-group-if-IG1)#show active
  group interface IG1
  interface Et8-9
  maintenance profile bgp BP1
switch(config-group-if-IG1)#exit
switch(config)#
```

- This command adds BGP profile BP1 to built-in interface group AllEthernetInterface.

```
switch(config)#group interface AllEthernetInterface
switch(config-builtin-group-if-AllEtherentInterface)#maintenance profile bgp BP1
switch(config-builtin-group-if-AllEtherentInterface)#show active
```

2588
group interface AllEthernetInterface
  maintenance profile bgp BPl

switch(config-built-in-group-if-AllEthernetInterface)#
14.6.7.10  maintenance profile interface

The maintenance profile interface <profile-name> command associates interface profile to interface group.

The no maintenance profile interface <profile-name> and default maintenance profile interface <profile-name> removes the interface profile from interface group.

Command Mode
Group-Interface Configuration
Built-in-Group-Interface Configuration

Command Syntax

maintenance profile interface profile-name
no maintenance profile interface profile-name
default maintenance profile interface profile-name

Parameters

• profile-name name of the interface profile

Example

• This command adds interface profile IP1 to interface group IG1.

```bash
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet8-9
switch(config-group-if-IG1)#maintenance profile interface IP1
group interface IG1
  interface Et8-9
  maintenance profile interface IP1
switch(config-group-if-IG1)#
```

• This command adds interface profile IP1 to built-in interface group AllEthernetInterface.

```bash
switch(config)#group interface AllEthernetInterface
switch(config-builtin-group-if-AllEthernetInterface)#maintenance profile interface IP1
switch(config-builtin-group-if-AllEthernetInterface)#show active
group interface AllEthernetInterface
  maintenance profile interface IP1
switch(config-builtin-group-if-AllEthernetInterface)#
```
14.6.7.11 maintenance

The `maintenance` command allows you to enter maintenance configuration mode and specify maintenance configuration options.

The `no maintenance` and `default maintenance` command removes the maintenance configuration from the `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

*maintenance*

*no maintenance*

*default maintenance*

**Commands available in maintenance configuration mode:**

- `unit`
- `bgp`
- `interface`
- `profile bgp`
- `profile interface`
- `profile unit`
- `profile interface <profile-name> default`
- `profile bgp <profile-name> default`
- `profile unit <profile-name> default`

**Examples**

- This example shows the commands to enter maintenance configuration mode and configure maintenance related parameters.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit foo
switch(config-profile-unit-foo)#on-boot duration 300
switch(config-profile-unit-foo)#exit
switch(config-maintenance)#unit U1
switch(config-unit-U1)#group interface IG1
switch(config-unit-U1)#group bgp BG1
switch(config-unit-U1)#profile unit foo
switch(config-unit-U1)#exit
switch(config-maintenance)#show active
maintenance
    profile unit foo
        on-boot duration 300
    unit U1
        group interface IG1
        group bgp BG1
    profile unit foo
switch(config-maintenance)#
```
14.6.7.12 neighbor

The `neighbor` command adds BGP peer(s) to a BGP group. The neighbors can be IPv4, IPv6 or a peer group. The `no neighbor <peer>` and `default neighbor <peer>` removes the BGP peer from the group.

**Command Mode**
Group-BGP Configuration

**Command Syntax**
```
neighbor ipv4_addr
no neighbor ipv4_addr
default neighbor ipv4_addr
neighbor ipv6_addr
no neighbor ipv6_addr
default neighbor ipv6_addr
neighbor peer group name
no neighbor peer group name
default neighbor peer group name
```

**Parameters**
- `ipv4_addr` BGP neighbor ipv4 address
- `ipv6_addr` BGP neighbor ipv6 address
- `peer group name` BGP peer group name

**Example**
- This command adds ipv4 peer 1.0.1.1, ipv6 peer 1::1 and peer group PG to the BGP group BG1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#exit
switch(config)#
```
14.6.7.13  on-boot duration

The on-boot duration command is a maintenance unit profile configuration option for specifying the duration after which the associated unit will be brought out of maintenance after reboot. The on-boot property in the maintenance unit profile specifies that the unit will be placed into maintenance mode as part of boot-up, and remain so for the specified duration.

The no on-boot and default on-boot removes this configuration from the unit profile.

Command Mode
Maintenance-Profile-Unit Configuration

Command Syntax
on-boot duration duration
no on-boot
default on-boot

Parameters
• duration number of seconds for which unit will remain under maintenance after reboot (from 300 to 3600 seconds)

Example
• This command configures on-boot duration of 1000 seconds in profile unit UP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 1000
switch(config-profile-unit-UP1)#show active
maintenance
    profile unit UP1
    on-boot duration 1000

switch(config-profile-unit-UP1)#
```
14.6.7.14  profile bgp <profile_name> default

The `profile bgp <profile_name> default` command configures a user-configured BGP profile as default BGP profile.

The `no profile bgp <profile_name> default` and `default profile bgp <profile_name> default` removes the user-configured BGP profile as default BGP profile.

Command Mode

Maintenance Configuration

Command Syntax

`profile bgp profile_name default`

`no profile bgp profile_name default`

`default profile bgp profile_name default`

Parameters

- `profile_name` name of the BGP profile

Example

- This command configures user configured BGP profile BP1 as default BGP profile.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#initiator route-map RM1 inout
switch(config-profile-bgp-BP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: Default
  Initiator route-map: SystemGenerated
  route-map SystemGenerated permit 10
  Description:
    description System generated initiator route-map
  Match clauses:
  Set clauses:
    set community GSHUT additive
    set local-preference 0

switch(config-maintenance)#
switch(config-maintenance)#profile bgp BP1 default
switch(config-maintenance)#show maintenance profile bgp default
Bgp Profile: BP1
  Initiator route-map: RM1
switch(config-maintenance)#
switch(config-maintenance)#show active maintenance
profile bgp BP1
  initiator route-map RM1 inout
profile bgp BP1 default

switch(config-maintenance)#
```
profile bgp

The `profile bgp` command places the switch in maintenance profile BGP configuration mode for configuring initiator route-map.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The `no profile bgp <profile-name>` and `default profile bgp <profile-name>` removes the profile from `running-config`.

**Command Mode**

Maintenance Configuration

**Command Syntax**

```
profile bgp profile-name
no profile bgp profile-name
default profile bgp profile-name
```

**Parameters**

- `profile-name` name of the BGP profile

**Commands available in maintenance profile BGP configuration mode:**

- `initiator route-map (route-map name) inout`

**Example**

- This command creates BGP profile BP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile bgp BP1
switch(config-profile-bgp-BP1)#show active
maintenance
  profile bgp BP1

switch(config-profile-bgp-BP1)#
```
14.6.7.16  profile interface <profile_name> default

The `profile interface <profile_name> default` command configures a user-configured interface profile as default interface profile.

The `no profile interface <profile_name> default` and `default profile interface <profile_name> default` removes the user-configured interface profile as default interface profile.

Command Mode
Maintenance Configuration

Command Syntax

```
profile interface <profile_name> default
no profile interface <profile_name> default
default profile interface <profile_name> default
```

Parameters

- `profile_name` name of the interface profile

Example

- This command configures user configured interface profile IP1 as default interface profile.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 100
switch(config-profile-intf-IP1)#rate-monitoring threshold 500
switch(config-profile-intf-IP1)#shutdown max-delay 100
switch(config-profile-intf-IP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: Default
  Rate Monitoring:
    load-interval: 60 seconds
    threshold (in/out): 100 kbps
    shutdown: enabled: no
    max-delay: 300 seconds

switch(config-maintenance)#
switch(config-maintenance)#profile interface IP1 default
switch(config-maintenance)#show maintenance profile interface default
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 100 seconds
    threshold (in/out): 500 kbps
    shutdown: enabled: yes
    max-delay: 100 seconds
switch(config-maintenance)#
switch(config-maintenance)#show active maintenance
profile interface IP1 default
profile interface IP1
  rate-monitoring load-interval 100
  rate-monitoring threshold 500
  shutdown max-delay 100

switch(config-maintenance)#
```
14.6.7.17 profile interface

The profile interface command places the switch in maintenance profile interface configuration mode for configuring rate-monitoring threshold, load-interval, and shutdown max-delay.

The command creates the profile if the specified interface profile does not exist prior to issuing the command.

The no profile interface <profile-name> and default profile interface <profile-name> removes the profile from running-config.

Command Mode
Maintenance Configuration

Command Syntax
profile interface profile-name
no profile interface profile-name
default profile interface profile-name

Parameters
• profile-name name of the interface profile

Commands available in maintenance profile interface configuration mode:
• rate-monitoring load-interval
• rate-monitoring threshold
• shutdown max-delay

Example
• This command creates interface profile IP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#show active
maintenance
  profile interface IP1
switch(config-profile-intf-IP1)#
```

switch(config-profile-intf-IP1)#
14.6.7.18  profile unit <profile_name> default

The `profile unit <profile_name> default` command configures a user-configured unit profile as default unit profile.

The no `profile unit <profile_name> default` and `default profile unit <profile_name> default` removes the user-configured unit profile as default unit profile.

Command Mode
Maintenance Configuration

Command Syntax
`profile unit profile_name default`
`no profile unit profile_name default`
`default profile unit profile_name default`

Parameters
• `profile_name` name of the interface profile

Example
• This command configures user-configured unit profile UP1 as the default unit profile.

```bash
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#on-boot duration 1000
switch(config-profile-unit-UP1)#exit
switch(config-maintenance)#
switch(config-maintenance)#show maintenance profiles unit default
Unit Profile: Default
  On-boot:
    enabled: no
    duration: 300 seconds

switch(config-maintenance)#profile unit UP1 default
switch(config-maintenance)#show maintenance profile unit default
Unit Profile: UP1
  On-boot:
    enabled: yes
    duration: 1000 seconds
switch(config-maintenance)#
switch(config-maintenance)#show active maintenance
  profile unit UP1 default
  profile unit UP1
    on-boot duration 1000

switch(config-maintenance)#
```
14.6.7.19  profile unit <profile_name>

The **profile unit <profile_name>** command associates unit profile to a particular unit. The **no profile unit <profile_name>** and **default profile unit <profile_name>** removes the unit profile from a unit.

**Command Mode**

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

**Command Syntax**

```
profile unit profile-name
no profile unit profile-name
default profile unit profile-name
```

**Parameters**

- **profile-name** name of the unit profile

**Examples**

- This command adds unit profile UP1 to UNIT1.

```plaintext
switch(config)#maintenance
switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#exit
switch(config-maintenance)#show maintenance units UNIT1
Unit Name: UNIT1
  Origin: User Configured
  Status: Not Under Maintenance
  Unit Profile: Default
  Time Since Last State Change: never
  Interface Groups:
    IG1

switch(config-maintenance)#unit UNIT1
switch(config-unit-UNIT1)#profile unit UP1
switch(config-unit-UNIT1)#show maintenance units UNIT1
Unit Name: UNIT1
  Origin: User Configured
  Status: Not Under Maintenance
  Unit Profile: UP1
  Time Since Last State Change: never
  Interface Groups:
    IG1

switch(config-unit-UNIT1)#show active
maintenance
  unit UNIT1
    group interface IG1
    profile unit UP1

switch(config-unit-UNIT1)#
```

- This command adds unit profile UP2 to built-in unit System.

```plaintext
switch(config)#maintenance
switch(config-maintenance)#profile unit UP2
switch(config-profile-unit-UP2)#on-boot duration 600
switch(config-profile-unit-UP2)#exit
switch(config-maintenance)#
switch(config-maintenance)#unit System
switch(config-builtin-unit-System)#show active
maintenance
  unit System
switch(config-builtin-unit-System)#exit
switch(config-maintenance)#show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
```
Unit Profile: Default
Time Since Last State Change: never
Interface Groups:
  AllEthernetInterface

switch(config-maintenance)#
switch(config-maintenance)#unit System
switch(config-built-in-unit-System)#profile unit UP2
switch(config-built-in-unit-System)#show active maintenance
unit System
  profile unit UP2
switch(config-built-in-unit-System)#exit
switch(config-maintenance)#show maintenance units System
Unit Name: System
  Origin: Built-in
  Status: Not Under Maintenance
  Unit Profile: UP2
  Time Since Last State Change: never
  Interface Groups:
    AllEthernetInterface

switch(config-maintenance)#
14.6.7.20  profile unit

The `profile unit` command places the switch in maintenance profile unit configuration mode for configuring on-boot duration.

The command creates the profile if the specified BGP profile does not exist prior to issuing the command.

The `no profile unit <profile-name>` and `default profile unit <profile-name>` removes the profile from `running-config`.

**Command Mode**
Maintenance Configuration

**Command Syntax**

```
profile unit profile-name
no profile unit profile-name
default profile unit profile-name
```

**Parameters**

- `profile-name` name of the unit profile

**Commands available in maintenance profile unit configuration mode:**

- `on-boot duration`

**Example**

- This command creates unit profile UP1.

```
switch(config)#maintenance
switch(config-maintenance)#profile unit UP1
switch(config-profile-unit-UP1)#show active maintenance
  profile unit UP1
switch(config-profile-unit-UP1)#
```
14.6.7.21 quiesce

The quiesce command places a unit or dynamic interface/BGP unit into maintenance mode, gracefully transitioning traffic away from it.

The no quiesce and default quiesce exits the unit from maintenance.

Command Mode

Maintenance-Unit Configuration

Maintenance-Built-in-Unit Configuration

Maintenance Dynamic-Interface Unit Configuration

Maintenance Dynamic-Bgp Unit Configuration

Command Syntax

quiesce

no quiesce

default quiesce

Examples

- This command places unit UNIT1, interface Et1, BGP peer 1.0.1.1 in VRF default, BGP peer 1::1 in VRF VRF1 into maintenance.

```bash
switch(config)#group interface IG1
switch(config-group-if-IG1)#interface Ethernet3-6
switch(config-group-if-IG1)#maintenance profile interface IP1
switch(config)#maintenance
switch(config-maintenance)#
unit UNIT1
switch(config-unit-UNIT1)#group interface IG1
switch(config-unit-UNIT1)#quiesce
switch(config-maintenance)#
interface Ethernet1
switch(config-maint-if-Et1)#quiesce
switch(config-maintenance)#
bgp 1.0.1.1
switch(config-maint-bgp-1.0.1.1)#quiesce
switch(config-maintenance)#
bgp 1::1 vrf VRF1
switch(config-maint-bgp-1::1)#quiesce
switch(config-maintenance)#
switch(config-maintenance)#show active maintenance
switch(config-maintenance)#show maintenance
Flags:
  o - On-boot maintenance
  v - Violating traffic threshold

```
14.6.7.22  rate-monitoring load-interval

The rate-monitoring load-interval command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring load interval with a load interval value between 5 and 600 seconds.

Command Mode
Maintenance-Profile-Interface Configuration

Command Syntax
rate-monitoring load-interval load_interval
no rate-monitoring load-interval load_interval
default rate-monitoring load-interval load_interval

Parameters
• load_interval load interval value between 5 and 600 seconds

Example
• This command configures the rate monitoring load interval for the profile interface IP1 to a load interval of 10 seconds.

```plaintext
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring load-interval 10
switch(config-profile-intf-IP1)#show active maintenance
  profile interface IP1
  rate-monitoring load-interval 10

switch(config-profile-intf-IP1)#
```
rate-monitoring threshold

The **rate-monitoring threshold** command is a maintenance interface profile configuration option for configuring the interfaces rate monitoring threshold with a threshold value between 1 and 4294967295 kilobytes.

The **no rate-monitoring threshold** and **default rate-monitoring threshold** removes this configuration from the interface profile.

**Command Mode**

Maintenance-Profile-Interface Configuration

**Command Syntax**

```
rate-monitoring threshold threshold_in_kbps
no rate-monitoring threshold threshold_in_kbps
default rate-monitoring threshold threshold_in_kbps
```

**Parameters**

- `threshold_in_kbps` threshold in kilobytes per second (kbps) between 1 and 4294967295 kilobytes

**Example**

- This command configures the rate monitoring threshold for the profile interface IP1 to a threshold of 1000 kilobytes per second (kbps).

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#rate-monitoring threshold 1000
switch(config-profile-intf-IP1)# show active maintenance
  profile interface IP1
    rate-monitoring threshold 1000
switch(config-profile-intf-IP1)#
```
14.6.7.24  **show interface <intf_name> status**

The `show interface <intf_name> status` command displays an m flag if the interface is undergoing maintenance operation.

**Command Mode**

EXEC

**Command Syntax**

`show interface [intf_name] status`

**Parameters**

- `intf_name` name of the interface
  - `ethernet e_range` Ethernet interfaces specified by `e_range`
  - `port-channel p_range` port channel interfaces specified by `p_range`
  - `vlan v_range` vlans specified by `v_range`

**Note:**

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

**Example**

- This command display tabular output and shows 'm' flag for Ethernet16/1 status.

```
switch#show interface Ethernet16/1 status
Port Name Status Vlan Duplex Speed Type Flags
Et1 disabled 1 auto auto 1000BASE-T ...
Et14/1 connected 2 full 40G 40GBASE-CR4
Et15/1 connected 2 full 40G 40GBASE-CR4
Et16/1 connected routed full 40G 40GBASE-CR4 m
Et17/1 notconnect 1 full 10G Not Present ...
switch#
```
14.6.7.25  show interface

The `show interface` command displays detailed information about the interface. It displays an extra line that reads: Under maintenance for time in hours and minutes.

**Command Mode**

EXEC

**Command Syntax**

`show interface intf_name`

**Parameters**

- `intf_name` name of the interface
- `ethernet e_range` Ethernet interfaces specified by `e_range`
- `port-channel p_range` port channel interfaces specified by `p_range`
- `vlan v_range` vlans specified by `v_range`

**Note:**

Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

**Example**

- This command displays detailed information about Ethernet 16/1 interface.

```bash
switch#show interface ethernet 16/1
Ethernet16/1 is up, line protocol is up (connected)
  Hardware is Ethernet, address is 001c.7373.efc7
  Internet address is 1.0.1.1/24
  Broadcast address is 255.255.255.255
  Address determined by manual configuration
  IP MTU 1500 bytes, BW 40000000 kbit
  Full-duplex, 40Gb/s, auto negotiation: off, uni-link: n/a
  Up 4 hours, 44 minutes, 36 seconds
  Under maintenance for 4 hours, 22 minutes, 26 seconds
  Loopback Mode : None
  2 link status changes since last clear
  Last clearing of "show interface" counters 4:45:12 ago
  5 minutes input rate 20 bps (0.0% with framing overhead), 0 packets/sec
  5 minutes output rate 20 bps (0.0% with framing overhead), 0 packets/sec
  580 packets input, 46286 bytes
  Received 1 broadcasts, 0 multicast
  0 input errors, 0 CRC, 0 alignment, 0 symbol, 0 input discards
  0 PAUSE input
  601 packets output, 48954 bytes
  Sent 7 broadcasts, 15 multicast
  0 output errors, 0 collisions
  0 late collision, 0 deferred, 0 output discards
  0 PAUSE output
switch#
```
14.6.7.26  `show ip | ipv6 bgp summary [ vrf <vrf_name>]`

The `show ip | ipv6 bgp summary [ vrf <vrf_name>]` command displays the m flag if the BGP IPv4 or IPv6 peer is undergoing maintenance operation.

**Command Mode**

EXEC

**Command Syntax**

```
show ip bgp summary [ vrf <vrf_name>]
show ipv6 bgp summary [ vrf <vrf_name>]
```

**Parameters**

- `vrf_name` name of the VRF

**Example**

- This command displays the 'm' flag in `show ip bgp summary` output for peer 1.0.1.2 which is in maintenance mode.

```
switch# show ip bgp summary
BGP summary information for VRF default
Router identifier 0.0.1.1, local AS number 200
Neighbor Status Codes: m - Under maintenance
   Neighbor V AS MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
       1.0.0.1 4 100 292 296 0 0 04:47:44 Estab 1 1
m 1.0.1.2 4 300 292 296 0 0 04:47:44 Estab 1 1
switch#
```
show ip | ipv6 bgp

The `show ip | ipv6 bgp` command displays maintenance related information when relevant.

Command Mode
EXEC

Command Syntax
- `show ip bgp neighbors <peer_addr> [vrf <vrf_name>]`
- `show ipv6 bgp peers <peer_addr> [vrf <vrf_name>]`

Parameters
- `peer_addr` name of the peer
  - `ipv4_addr` BGP neighbor IPv4 address
  - `ipv6_addr` BGP neighbor IPv6 address
  - `peer-group-name` BGP peer group name
- `vrf_name` name of the VRF

Example
- This command displays the m flag in `show ip bgp summary` output for peer 1.0.1.2 which is in maintenance mode.

```
switch#show ip bgp neighbors 1.0.1.2
BGP neighbor is 1.0.1.2, remote AS 300, external link
BGP version 4, remote router ID 0.0.2.1, VRF default
Negotiated BGP version 4

switch#
The `show maintenance bgp receiver route-map` command displays receiver route-map which is applied during maintenance operation.

**Command Mode**
EXEC

**Command Syntax**
`show maintenance bgp receiver route-map`

**Example**
- This command displays receiver route-map contents.

```
switch#show maintenance bgp receiver route-map
route-map SystemGenerated permit 10
  Description:
    description System generated receiver route-map
  Match clauses:
    match community GSHUT-LIST
SubRouteMap:
Set clauses:
route-map SystemGenerated permit 50
  Description:
    description System generated receiver route-map
  Match clauses:
SubRouteMap:
Set clauses:switch#
```
14.6.7.29 **show maintenance bgp**

The `show maintenance bgp` command displays detailed maintenance information about BGP peers.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance bgp <ipv4_addr> [vrf <vrf_name>] | <ipv6_addr> [vrf <vrf_name>] | <peer_group> [vrf <vrf_name>] | ip all [vrf <vrf_name> | vrf all] | ipv6 all [vrf <vrf_name> | vrf all]
```

**Parameters**

- `ipv4_addr` BGP neighbor ipv4 address
- `ipv6_addr` BGP neighbor ipv6 address
- `peer_group` BGP peer group name
- `vrf_name` name of the VRF to which peer belongs
- `ip all vrf vrf_name` all ipv4 peers in specified VRF
- `ipv6 all vrf vrf_name` all ipv6 peers in specified VRF
- `ip all vrf all` all ipv4 peers in all the VRFs
- `ipv6 all vrf all` all ipv6 peers in all the VRFs

**Example**

- This command displays maintenance information about BGP peers 1.0.0.1 and 1.0.1.1 and maintenance route-map applied.

```
switch#show maintenance bgp ip all vrf all
BGP peer maintenance information for VRF default
Router identifier 0.0.1.1, local AS number 200
Neighbor: 1.0.0.1
   Maintenance state: Under Maintenance
   Maintenance route-map: SystemGenerated
Neighbor: 1.0.1.2
   Maintenance state: Under Maintenance
   Maintenance route-map: SystemGenerated

switch#
```
14.6.7.30  show maintenance debug

The `show maintenance debug` command displays the history of various maintenance operations on a unit/interface/BGP peer.

**Command Mode**
EXEC

**Command Syntax**

```
show maintenance debug bgp [peer_name] | interface [intf_name] | units [unit_name]
```

**Parameters**

- `bgp` display history of all dynamic BGP units which have undergone maintenance operation
- `interface` display history of all dynamic interface units which have undergone maintenance operation
- `units` display history of all units which have undergone maintenance operation
- `peer_name` name of the peer
  - `ipv4_addr` BGP neighbor IPv4 address
  - `ipv6_addr` BGP neighbor IPv6 address
  - `peer-group-name` BGP peer group name
- `intf_name` name of the interface
  - `ethernet e_range` Ethernet interfaces specified by `e_range`
  - `port-channel p_range` port channel interfaces specified by `p_range`
  - `vlan v_range` vlans specified by `v_range`

**Note:** Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges. Valid Ethernet numbers depend on the Ethernet interfaces available on the switch.

- `unit_name` name of the unit

**Example**

- This command displays history of maintenance operation on Ethernet 16/1.

```
switch# show maintenance debug interface Ethernet 16/1-4
Interface Ethernet16/1
  History:

14.6.7.31  show maintenance groups

The show maintenance groups command displays all the interface/BGP groups along with their members and associated profiles.

Command Mode
EXEC

Command Syntax
show maintenance groups interface | bgp <group_name>

Parameters
•  interface display only interface groups
•  bgp display only BGP groups
•  group_name name of the group

Example
•  This command displays group details for built-in interface group AllEthernetInterface and built-in BGP group AllBgpNeighborVrf-default and user-configured interface group IG1.
14.6.7.32 show maintenance interface status

The show maintenance interface status command displays maintenance status and rates for interfaces.

Command Mode
EXEC

Command Syntax
show maintenance interface status active | entering | exiting | quiesced

Parameters
- active interfaces which are active
- entering interface which are entering maintenance
- exiting interface which are exiting maintenance
- quiesced interface which are under maintenance

Example
- This command displays interface status and traffic rates of interfaces which are quiesced.

```
switch#show maintenance interface status quiesced
Flags:
v - Violating traffic threshold
s - Shutdown for maintenance
Rate (Mbps)
Interface  Status  In  Out  Flags
----------------------- ---------------------------- --------- ---------- 
------
Ethernet1 Not Under Maintenance - -
Ethernet2 Not Under Maintenance - -
Ethernet3 Not Under Maintenance - -
Ethernet4 Not Under Maintenance - -
Ethernet16/1 Under Maintenance 0.0 0.0
Port-Channel10 Under Maintenance 100.5 50.5v
Port-Channel11 Entering Maintenance 15.5 10.5
Port-Channel10 Under Maintenance - -

switch#
```
show maintenance interface

The `show maintenance interface` command displays detailed information about interfaces and their maintenance status with traffic rates.

**Command Mode**
EXEC

**Command Syntax**
```
show maintenance interface [intf_name [detail] | detail]
```

**Parameters**
- `intf_name` name of the interface or sub-interface. Options include:
  - `ethernet e_range` Ethernet interfaces specified by `e_range`
  - `port-channel p_range` port channel interfaces specified by `p_range`
  - `vlan v_range` vlans specified by `v_range`
- `detail` provides the detailed rate-monitoring information

**Guidelines**
Valid `e_range`, `p_range` and `v_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**
- This command displays interface status and traffic rates.

```
switch# show maintenance interface
Flags:
  v - Violating traffic threshold
  s - Shutdown for maintenance
Rate (Mbps)
Interface    Status     In Out  Flags
------------------- ---------------------------- --------- ---------- ------
Ethernet1     Not Under Maintenance -  -
Ethernet2     Not Under Maintenance -  -
Ethernet3     Under Maintenance 0.0 0.0
Ethernet4     Not Under Maintenance -  -
...          Ethernet35 Entering Maintenance 8.7 2.9
Ethernet36    Not Under Maintenance -  -
switch#
```

- This command displays detailed information about the interface Ethernet16/1.

```
switch# show maintenance interface Ethernet16/1 detail
Ethernet16/1 is Under Maintenance
Groups: AllEthernetInterface
Selected profiles from Interface groups:
  Interface Maintenance profile: low-load-interval-profile
  Bgp Maintenance profile: Default
Bgp:
  Maintenance State: Under Maintenance
  Vrf: default
  Neighbor: 1.0.1.2
  Maintenance routemap: SystemGenerated
Rate Monitoring:
  Passive monitoring since 0:42:25 ago
  Total samples taken: 236
  Before Maintenance:
    Below threshold: 1
    Above threshold: 0
  After Maintenance:
    Below threshold: 235
    Above threshold: 0
  Last sample information:
    Sample taken 0:00:04 ago
    In: 0.0 Mbps
    Out: 0.0 Mbps
switch#
```
14.6.7.34  show maintenance profiles

The show maintenance profiles command displays all the interface/BGP/unit profiles configuration.

**Command Mode**
EXEC

**Command Syntax**

```
show maintenance profiles interface | bgp | unit <profile_name>
```

**Parameters**
- *interface* display only interface profiles
- *bgp* display only BGP profiles
- *unit* display only unit profiles
- *profile_name* name of the profile

**Example**
- This command displays profile configuration details for interface profile IP1, unit profile UP1 and BGP profile BP1.

```
switch#show maintenance profiles
Interface Profile: IP1
  Rate Monitoring:
    load-interval: 444 seconds
    threshold (in/out): 4000 Kbps
  shutdown:
    enabled: yes
    max-delay: 399 seconds
Bgp Profile: BP1
  Initiator route-map:
    name: RM1
Unit Profile: UP1
  On-boot:
    enabled: yes
    duration: 340 seconds
switch #
```
### 14.6.7.35 show maintenance stages

The **show maintenance stages** command displays stages of maintenance operation while entering/exiting maintenance.

**Command Mode**

EXEC

**Command Syntax**

```
show maintenance stages [enter | exit]
```

**Parameters**

- **enter** display maintenance stages during maintenance enter operation
- **exit** display maintenance stages during maintenance exit operation

**Example**

- This command displays maintenance mode stages details.

  ```
  switch #**show maintenance stages**
  No. Stage Description
  --------- ------------- --------------------------
  1 bgp BGP Maintenance processing
  2 ratemon Interface Rate Monitoring
  Maintenance Exit Stage Sequence
  No. Stage Description
  --------- ------------- --------------------------
  1 ratemon Interface Rate Monitoring
  2 bgp BGP Maintenance processing
  switch #
  ```

- This command displays maintenance mode stage details during entry.

  ```
  switch #**show maintenance stages enter**
  No. Stage Description
  --------- ------------- --------------------------
  1 bgp BGP Maintenance processing
  2 ratemon Interface Rate Monitoring
  switch#
  ```
14.6.7.36  show maintenance summary

The `show maintenance summary` command displays summarized information about the maintenance mode operations such as number of units configured, number of units Entering/Exiting maintenance etc.

**Command Mode**

EXEC

**Command Syntax**

`show maintenance summary`

**Example**

- This command displays summary of maintenance mode operations.

```
switch#show maintenance summary
Number of Units Configured: 0
Number of Units Exiting Maintenance: 0
Number of Units Entering Maintenance: 0
Number of Units Not Under Maintenance: 1
Number of Units Under Maintenance: 0
Directly Put Under Maintenance:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of bgp peers Entering Maintenance: 0
  Number of bgp peers Under Maintenance: 1
Rate Monitoring:
  Number of interfaces Entering Maintenance: 0
  Number of interfaces Under Maintenance: 1
  Number of interfaces Under Maintenance with threshold violation: 0
  Number of interfaces shutdown for maintenance: 0
switch#
```
14.6.7.37  show maintenance units

The `show maintenance units` command displays detailed information about the particular unit.

**Command Mode**
EXEC

**Command Syntax**

```plaintext
show maintenance units [unit_name]
```

**Parameters**
- `unit_name` name of unit

**Example**
- This command displays maintenance units details.

```plaintext
switch#show maintenance units
Unit Name: System
Origin: Built-in
Status: Not Under Maintenance
Unit Profile: Default
Time Since Last State Change: never
Bgp Groups:
  AllBgpNeighborVrf-default
Interface Groups:
  AllEthernetInterface

  Unit Name: UNIT1
  Origin: User Configured
  Status: Under Maintenance
  Unit Profile: UP1
  Time Since Last State Change: 0:00:08 ago
  Bgp Groups:
    BG1
  Interface Groups:
    IG1
  History:
    2016-08-29 23:05:30 old state: 'maintenanceModeEnter' to new state:
    'underMaintenance' 0:00:08 ago
    2016-08-29 23:05:30 old state: 'active' to new state: 'maintenanceModeEnter'
    0:00:08 ago

switch#
```
14.6.7.38  show maintenance

The `show maintenance` command provides brief information about all units/dynamic interface unit/dynamic bgp unit and status.

'o' - flag displays that unit is undergoing or has undergone a maintenance operation because of on-boot.

'v' - flag displays that one/some of the interfaces are violating traffic, i.e. traffic for those interfaces is above threshold.

**Command Mode**

EXEC

**Command Syntax**

`show maintenance`

**Examples**

- This command displays maintenance mode details.

```plaintext
switch# show maintenance
Flags: 
o  - On-boot maintenance
v  - Violating traffic threshold
Unit Name Status Time since last change Flags
====-=-----------------------------------------------------
System Not Under Maintenance never
Foo Under Maintenance 0:00:40 ago o

Interface Name Status Time since last change Flags
---------------------- ----------------------- -------------------------- ----- 
Ethernet16/1 Entering Maintenance 0:00:02 ago v

Bgp Neighbor(vrf: defa Status Time since last change Flags
---------------------- ----------------------- -------------------------- ----- 
1.0.0.2 Not Under Maintenance never

Bgp Neighbor(vrf: red) Status Time since last change Flags
---------------------- ----------------------- -------------------------- ----- 
2.0.1.2 Under Maintenance 0:00:16 ago

switch# 
```
14.6.7.39 **shutdown max-delay**

The **shutdown max-delay** command is a maintenance interface profile configuration option for configuring the maximum duration after which the interface is shutdown with a value between 1 and 4294967295 seconds.

The **no shutdown** and **default shutdown** removes this configuration from the interface profile.

**Command Mode**

Maintenance-Profile-Interface Configuration

**Command Syntax**

```markdown
shutdown max-delay delay
no shutdown max-delay delay
default shutdown max-delay delay
```

**Parameters**

- **delay** maximum shutdown delay between 1 and 4294967295 seconds

**Example**

- This command configures the shutdown max-delay for the profile interface IP1 to 500 seconds or one hour.

```
switch(config)#maintenance
switch(config-maintenance)#profile interface IP1
switch(config-profile-intf-IP1)#shutdown max-delay 500
switch(config-profile-intf-IP1)#show active
maintenance
  profile interface IP1
    shutdown max-delay 500

switch(config-profile-intf-IP1)#
```
trigger on-maintenance

The **trigger on-maintenance** command is an event handler configuration for triggering actions during the maintenance operation of a unit, interface and BGP peer at specified stages.

The event-handler configuration takes effect only after exiting the event-handler configuration mode.

### Command Mode

Event-handler Configuration

### Command Syntax

```plaintext
trigger on-maintenance <enter | exit> <unit <unit_name> | bgp <ipv4_addr | ipv6_addr | peer_group> [vrf <vrf_name>]] | interface <intf_name>> <begin | end | all | <before | after> stage <stage_name>>
```

#### Parameters

- **enter** trigger on-maintenance event-handler on maintenance enter operation
- **exit** trigger on-maintenance event-handler on maintenance exit operation
- **bgp** trigger event-handler on dynamic BGP unit maintenance operation
  - **ipv4_addr** BGP neighbor ipv4 address
  - **ipv6_addr** BGP neighbor ipv6 address
  - **peer_group** BGP peer group name
- **vrf vrf_name** name of the VRF to which BGP peer belongs
- **interface** trigger event-handler on dynamic interface unit maintenance operation
  - **intf_name** name of the interface
    - **ethernet** trigger event-handler on specified Ethernet interface
    - **port-channel** trigger event-handler on specified port channel interface
    - **vlan** trigger event-handler on specified vlan
- **unit** trigger event-handler on maintenance operation of unit
- **begin** action is triggered in the beginning of maintenance operation
- **end** action is triggered at the end of maintenance operation
- **stage_name** action is triggered at specified stage
  - **bgp** and **ratemon** are the two stages
  - **all** action is triggered at all the stages
  - **before** action is triggered before the specified stage
  - **after** action is triggered after the specified stage

#### Examples

- This command configures event-handler E1, which triggers on maintenance an enter operation of unit UNIT1 at all the stages.

  ```bash
  switch(config)#event-handler E1
  switch(config-handler-E1)#trigger on-maintenance enter unit UNIT1 all
  switch(config-handler-E1)#action bash FastCli -c "show maintenance"
  switch(config-handler-E1)# exit
  switch(config)# show event-handler E1
  Event-handle 1
  Trigger: Asynchronous on-maintenance enter unit UNIT1 all delay 0 seconds
  Threshold Time Window: 0 Seconds, Event Count: 1 times
  Action: FastCli -c "show maintenance"
  Action expected to finish in less than 10 seconds
  ```
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

This command configures event-handler E2, which triggers on maintenance an exit operation of dynamic interface unit Ethernet1 before stage bgp.

switch(config)#event-handler E2
switch(config-handler-E2)#trigger on-maintenance exit interface Ethernet1 before stage bgp
switch(config-handler-E2)#action bash FastCli -c "show maintenance summary"
switch(config-handler-E2)# exit
switch(config)# show event-handler E2
Event-handler E2
Trigger: Asynchronous on-maintenance exit interface Ethernet1 before stage bgp
delay 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance summary"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

This command configures event-handler E3, which triggers on maintenance an enter operation of dynamic BGP unit 1::1 in VRF VRF1 at the last stage end.

switch(config)#event-handler E3
switch(config-handler-E3)#trigger on-maintenance enter bgp 1::1 vrf VRF1 end
switch(config-handler-E3)#action bash FastCli -c "show maintenance bgp ip all vrf all"
switch(config-handler-E3)# exit
switch(config)# show event-handler E3
Event-handler E3
Trigger: Asynchronous on-maintenance enter bgp 1::1 vrf VRF1 end delay 0 seconds
Threshold Time Window: 0 Seconds, Event Count: 1 times
Action: FastCli -c "show maintenance bgp ip all vrf all"
Action expected to finish in less than 10 seconds
Last Trigger Detection Time: Never
Total Trigger Detections: 0
Last Trigger Activation Time: Never
Total Trigger Activations: 0
Last Action Time: Never
Total Actions: 0

switch(config)#
14.6.7.41 unit

The `unit <unit_name>` command places the switch in maintenance unit configuration mode for configuring BGP/interface groups in the unit.

The command creates the unit if the specified unit profile does not exist prior to issuing the command.

The `no unit <unit-name>` and `default unit <unit-name>` removes the unit from `running-config`.

**Command Mode**

Maintenance Configuration

**Command Syntax**

```plaintext
unit linecard l_range | unit_name
no unit linecard l_range | unit_name
default unit linecard l_range | unit_name
```

**Parameters**

- `Linecard l_range` name of the Linecard built-in unit
- `0 l_range` linecards available on the switch
- `unit_name` name of the user-configured unit

**Commands available in maintenance unit configuration mode:**

- `group interface`
- `group bgp`
- `profile unit`
- `quiesce`

**Note:** Built-in units like System, Linecard3, Linecard4, etc. do not allow group configuration but unit profile can be associated to these units.

**Examples**

- This command creates maintenance unit UNIT1.

  ```text
  switch(config)#maintenance
  switch(config-maintenance)#unit UNIT1
  switch(config-unit-UNIT1)#show active maintenance
  unit UNIT1
  switch(config-unit-UNIT1)#
  ```

- This command enters the built-in Linecard1 unit configuration mode.

  ```text
  switch(config)#maintenance
  switch(config-maintenance)#unit Linecard1
  switch(config-builtin-unit-Linecard1)#show active maintenance
  unit Linecard1
  switch(config-builtin-unit-Linecard1)#
  ```
14.6.7.42 vrf

The **vrf** command specifies the VRF for BGP group. All the neighbors configured in the BGP group are considered to be members of the BGP group in the particular VRF context.

The **no vrf <vrf-name>** and **default vrf <vrf-name>** removes the VRF configuration from the BGP group and sets the VRF context to default.

**Command Mode**

Group-BGP Configuration

**Command Syntax**

```
vrf vrf_name
no vrf vrf_name
default vrf vrf_name
```

**Parameters**

- **vrf_name** name of the VRF in a group belonging to neighbors in that group

**Example**

- This command specifies VRF VRF1 for the neighbors in the BGP group BGP1.

```
switch(config)#group bgp BG1
switch(config-group-bgp-BG1)#neighbor 1.0.1.1
switch(config-group-bgp-BG1)#neighbor 1::1
switch(config-group-bgp-BG1)#neighbor PG
switch(config-group-bgp-BG1)#vrf VRF1
switch(config-group-bgp-BG1)#show active
group bgp BG1
   neighbor 1.0.1.1
   neighbor 1::1
   neighbor PG
   vrf VRF1
switch(config-group-bgp-BG1)#exit
switch(config)#
```

14.7 Bidirectional Forwarding Detection

This section describes Bidirectional Forwarding Detection (BFD) and how it is configured in relation to various protocols. Topics in this section include:

- **Introduction**
- **BFD Configuration**
- **Hardware Accelerated BFD Transmit**
- **BFD Commands**

14.7.1 Introduction

In networks without data link signaling, connection failures are usually detected by the hello mechanisms of routing protocols. Detection can take over a second, and reducing detection time by increasing the rate at which hello packets are exchanged can create an excessive burden on the participating CPUs.

BFD is a low-overhead, protocol-independent mechanism which adjacent systems can use instead for faster detection of faults in the path between them. BFD is strictly a failure-detection mechanism, and does not discover neighbors or reroute traffic.
Routing Protocols

BFD is a simple mechanism which detects the liveness of a connection between adjacent systems, allowing it to quickly detect failure of any element in the connection. It does not operate independently, but only as an adjunct to routing protocols. The routing protocols are responsible for neighbor detection, and create BFD sessions with neighbors by requesting failure monitoring from BFD.

Once a BFD session is established with a neighbor, BFD exchanges control packets to verify connectivity and informs the requesting protocol of failure if a specified number of successive packets are not received. The requesting protocol is then responsible for responding to the loss of connectivity.

Routing protocols using BFD for failure detection continue to operate normally when BFD is enabled, including the exchange of hello packets.

The basic behavior of BFD is defined in RFC 5880.

14.7.1.1 BFD Modes

BFD functions in asynchronous or demand mode, and also offers an echo function. EOS supports asynchronous mode and the echo function.

- Asynchronous Mode
- Demand Mode

14.7.1.1.1 Asynchronous Mode

In asynchronous mode, BFD control packets are exchanged by neighboring systems at regular intervals. If a specified number of sequential packets are not received, BFD declares the session to be down.

14.7.1.1.2 Demand Mode

In demand mode, once the BFD session is established, the participating systems can request that BFD packets not be sent, then request an exchange of packets only when needed to verify connectivity. EOS does not support demand mode.

14.7.1.2 Echo Function

When the echo function is in use, echo packets are looped back through the hardware forwarding path of the neighbor system without involving the CPU. Failure is detected by an interruption in the stream of echoed packets. The minimum reception rate for BFD control packets from the neighbor is also changed automatically when the echo function is operational, because liveness detection is supplied by the echo packets.

While BFD control messages are transmitted to port 3784, BFD echo messages use UDP port 3785 for both source and destination.

14.7.1.3 BFD on Port Channels

On port channels, the BFD per-link feature can be used to add resiliency to the port channel’s BFD sessions. When BFD per-link is enabled, BFD considers the port channel "up" as long as any link in the port channel is functioning properly.

BFD per-link can be configured in full compliance with RFC 7130, causing member ports to be removed from the port channel when their BFD micro sessions are down, or in legacy mode, which relies on the LAG itself to detect and remove unresponsive member ports. By default, BFD per-link operates in legacy mode, which allows the switch to inter-operate more effectively with older equipment, but which may drop traffic if downed links are not detected by other means. RFC 7130 mode allows for faster detection and removal of downed links within the port channel and can be used in situations where LACP is not supported. For the BFD session to come up, both peers must be configured in the same way.
14.7.2  BFD Configuration

To use BFD as the failure detection mechanism for a routing protocol, it must be enabled for each participating protocol.

These sections describe BFD configuration tasks:

- Configuring BFD on an Interface
- Configuring BFD on a Port Channel
- Configuring the Echo Function
- Configuring BFD for PIM
- Configuring BFD for BGP
- Configuring BFD for VRRP
- Configuring BFD for OSPF
- Configure BFD for IS-IS
- Configuring BFD Session Telemetry
- Displaying BFD Neighbor Information

14.7.2.1  Configuring BFD on an Interface

The transmission rate for BFD control packets, the minimum rate at which control packets are expected from the peer, and the multiplier (the number of packets that must be missed in succession before BFD declares the session to be down) can all be configured per interface. The values configured apply to all BFD sessions that pass through the interface.

The default values for these parameters are:

- transmission rate 300 milliseconds
- minimum receive rate 300 milliseconds
- multiplier 3

To configure different values for these parameters on an interface, use the `bfd interval` command.

For BFD to function as a failure detection mechanism, it must be enabled for each participating protocol.

Example

- These commands set the transmit and receive intervals to 200 milliseconds and the multiplier to 2 for all BFD sessions passing through Ethernet interface 3/20.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#bfd interval 200 min_rx 200 multiplier 2
```

14.7.2.2  Configuring BFD on a Port Channel

Basic BFD parameters are configured on a port channel as described in Configuring BFD on an Interface above.

Additionally, BFD can be configured in per-link mode on a port channel so that the port channel will be considered up as long as any link in the channel is up. BFD per-link can be configured in compliance with RFC 7130 (causing member ports to be removed from the port channel when their BFD micro session is down), or in legacy mode for interoperability with older equipment. For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

Note: In RFC 7130 mode, if multiple IP addresses are configured for a member of a port channel (e.g., one IPv4 address and one IPv6 address), the member will be removed from the port channel if the micro session associated with either IP address goes down.
### 14.7.2.2.1 Enabling BFD Per-link

To enable BFD per-link on a port channel, use the `bfd per-link` command.

**Example**

- These commands enabled BFD per-link on port channel 5.

  ```
  switch(config)#interface port-channel 5
  switch(config-if-Po5)#bfd per-link
  switch(config-if-Po5)#
  ```

### 14.7.2.2 Configuring BFD Per-link in RFC 7130 Mode

By default, BFD per-link operates in legacy mode. To enable RFC 7130 mode (in which a member port is removed from the port channel when its BFD micro session is down), configure the switch as follows.

1. If you are configuring an L2 interface, specify a local L3 BFD address for the switch using the `bfd local-address` command. This is not necessary when configuring an L3 interface with an IP address configured on the port channel.
2. Enable BFD per-link on the port channel using the `bfd per-link` command.
3. Specify the L3 address of the port channel's BFD neighbor using the `bfd neighbor` command. For an L2 port channel, the address is the globally configured BFD local address on the peer switch. For an L3 port channel, the address is the IP address configured on the peer port channel.

**Examples**

- These commands configure BFD per-link in RFC 7130 mode over an L2 port channel.

  **Switch 1 configuration:**

  ```
  switch1(config)#bfd local-address 10.0.0.5
  switch1(config)#interface port-channel 5
  switch1(config-if-Po5)#bfd per-link rfc-7130
  switch1(config-if-Po5)#bfd neighbor 10.0.0.4
  switch1(config-if-Po5)#
  ```

  **Switch 2 configuration:**

  ```
  switch2(config)#bfd local-address 10.0.0.4
  switch2(config)#interface port-channel 5
  switch2(config-if-Po5)#bfd per-link rfc-7130
  switch2(config-if-Po5)#bfd neighbor 10.0.0.5
  switch2(config-if-Po5)#
  ```

- These commands configure BFD per-link in RFC 7130 mode over an L3 port channel.

  **Switch 1 configuration:**

  ```
  switch1(config)#interface port-channel 5
  switch1(config-if-Po5)#no switchport
  switch1(config-if-Po5)#bfd per-link rfc-7130
  switch1(config-if-Po5)#ip address 10.0.0.5/24
  switch1(config-if-Po5)#bfd neighbor 10.0.0.4
  switch1(config-if-Po5)#
  ```

  **Switch 2 configuration:**

  ```
  switch2(config)#interface port-channel 5
  switch2(config-if-Po5)#no switchport
  ```
14.7.2.3 Configuring the Echo Function

The echo function is disabled by default, and is enabled on an interface using the `bfd echo` command. When the BFD echo function is enabled, a "slow-timer" value replaces the minimum receive interval value in BFD packets sent from the switch. The default value is 2000 milliseconds. To configure a different value for the slow-timer, use the `bfd slow-timer` command.

**Examples**

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd echo
```

- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

```
switch(config)#bfd slow-timer 10000
```

14.7.2.4 Configuring BFD for PIM

The `bfd (Router-PIM Sparse-mode)` command enables or disables Bidirectional Forwarding Detection (BFD) globally for all protocol-independent multicast (PIM) neighbors.

To enable or disable PIM BFD on a specific interface, use the `pim ipv4 bfd` command. The interface-level configuration supersedes the global setting.

**Example**

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#bfd
```

- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config)#interface vlan 200
switch(config-if-VL200)#pim ipv4 bfd
```

14.7.2.5 Configuring BFD for BGP

To enable or disable Bidirectional Forwarding Detection (BFD) for border gateway protocol (BGP) connections with a BGP neighbor or peer group, use the `neighbor bfd` command.
Example

• These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.13.64.1 bfd
switch(config-router-bgp)#
```

14.7.2.6 Configuring BFD for VRRP

To enable or disable Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP), use the `vrrp bfd ip` command.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

Example

• These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```

14.7.2.7 Configuring BFD for OSPF

To enable or disable BFD globally for all OSPF neighbors, use the `bfd default (OSPF)` command in OSPF configuration mode.

To enable or disable BFD for OSPF on a specific interface, use the `ip ospf neighbor bfd` command. The interface-level configuration supersedes the global setting.

Example

• These commands enable BFD in OSPF instance 100 for all OSPF neighbors on BFD-enabled interfaces except those connected to interfaces on which OSPF BFD has been explicitly disabled.

```
switch(config)#router ospf 100
switch(config-router-ospf)#bfd default
switch(config-router-ospf)#
```

• This command enables OSPF BFD on Ethernet interface 3/21.

```
switch(config)#interface ethernet 3/21
switch(config-if-Et3/21)#ip ospf neighbor bfd
switch(config-if-Et3/21)#
```

14.7.2.8 Configure BFD for IS-IS

The `isis bfd` and command configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.
Examples

• These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is
  disabled on all the interfaces.

  switch(config)#router isis 1
  switch(config-router-isis)#address-family ipv4
  switch(config-router-af)#bfd default
  switch(config-router-af)#

• These commands enable BFD on IS-IS interfaces.

  switch(config)#interface Ethernet 5/6
  switch(config-if-Et5/6)#isis bfd
  switch(config-if-Et5/6)#

14.7.2.9 Configuring BFD Session Telemetry

The BFD session telemetry automatically collects the per-session statistics and the rbfd kernel module
statistics at a set interval and stores them in a shared memory where Cloud Vision Portal (CVP) or
other applications may collect this information. Also, several new statistics have been added which are
updated within the session-stats interval and provides a finer snapshot view of the session health. The
BFD session telemetry supports both hardware-accelerated and software (kernel module) accelerated
BFD sessions.

Use the session stats snapshot interval command to enable the BFD session telemetry. This command is configured under the router-bfd configuration mode. By default, this command is
disabled and the telemetry interval is set to zero seconds. A telemetry interval between 10 and 3600
seconds may be configured.

Use the no and default form of the command to disable the session stats snapshot interval command
from the running configuration and sets the telemetry interval is set to zero.

Example

switch(config-router-bfd)#session stats snapshot interval 10

A telemetry interval may be configured to a value less than 10 seconds and as small as 1 second using
an additional keyword dangerous, as follows:

switch(config-router-bfd)#session stats snapshot interval dangerous 1

However, note that, configurations including a telemetry interval of less than 10 seconds are not
advised for systems with a large-scale BFD deployment as this may cause delays in the rbfd kernel
module and result in BFD session instability.

14.7.2.10 Displaying BFD Neighbor Information

Use the show bfd peers command to display information about Bidirectional Forwarding Detection
(BFD) neighbors.

Example

• This command displays general information about BFD neighbors.

  switch>show bfd peers
  DstAddrMyDiscYoDiscIFLUPLDownLdiagState
  10.168.1.561613et52_1(81)17151450 ONoDiagnosticUp
  10.168.1.581714et52_2(65)17151883 ONoDiagnosticUp

2632
10.168.1.241815et51_1(73)17152175 0NoDiagnosticUp

- This command displays detailed information about BFD neighbors.

```text
switch>show bfd peers detail
Peer Addr 10.168.1.56, Intf Ethernet52/1, State Up
VRF default, LAddr 10.168.1.57, LD/RD 16/13
Last Up 17151450
Last Down 0
Last Diag: No Diagnostic

Received RxInt: 300, Received Multiplier: 3
Rx Count: 434235, Tx Count: 434050
Detect Time: 900
Registered protocols: bgp
```

14.7.3 Hardware Accelerated BFD Transmit

Hardware Accelerated BFD Transmit adds support for offloading BFD Transmit path to hardware (ASIC) for specific types of BFD sessions.

Hardware Accelerated BFD Transmit improves accuracy of transmit timer implementations for BFD (especially with fast timers like 50 ms) and relieves pressure on the main CPU in scenarios of scale. The RX packet processing for all BFD sessions is still handled by the BFD agent on the main CPU. The feature does not add any additional timer interval or multiplier configurations.

On supported platforms, hardware acceleration-capable BFD sessions is offloaded by default. Memory resources are required on ASIC to offload sessions (one unit per discriminator). Currently, the number of session discriminators that can be offloaded is restricted to 200 per ASIC.

Only single-hop BFD sessions on front panel ports are capable of being offloaded. In EOS Release 4.23.0F, the following sessions types cannot be offloaded:

- BFD sessions over Port-Channel Sub-Interfaces
- BFD sessions over L3 Sub-Interfaces
- BFD sessions over an entire Port-Channel (not per member BFD)
- BFD sessions over a Switched Virtual Interface
- BFD sessions over a Loopback interface
- BFD sessions over Tunnel interfaces
- Multi-hop BFD sessions
- BFD sessions with Authentication configured

From EOS Release 4.23.1F onwards, the following additional session types can be offloaded:

- BFD sessions over L3 Sub-Interfaces

From EOS Release 4.24.0F onwards, hardware acceleration is only supported on certain SSO redundancy protocol configured modular systems.

Note: For the purposes of memory management in hardware, each discriminator occupies one unit of memory. When echo mode is enabled on a session, both asynchronous mode and
the echo function have separate discriminators and each take up a unit each amongst the 200 available per ASIC.

14.7.3.1 Platform Compatibility

Starting with the **EOS Release 4.23.0F** onwards, the following platforms are supported:

14.7.3.2 Configuration

The Hardware Accelerated BFD Transmit feature is enabled by default on supported platforms. No explicit configuration is required.

The feature may be disabled using the following command:

```
switch(config-router-bfd)#hardware acceleration disabled
```

14.7.3.3 Show Commands

**Hardware Acceleration Information**

To view whether hardware acceleration is running use the `show bfd hardware acceleration` command. In this example, hardware acceleration is running.

**Example**

```
switch(config)#show bfd hardware acceleration
Hardware acceleration is running
```

The following example displays when hardware acceleration is not enabled and the reasons why.

**Example**

```
switch#show bfd hardware acceleration
Hardware acceleration is not running: user disabled, no eligible sessions, not supported with SSO
```

The reasons listed for when hardware acceleration could be a subset of the following:

- **User disabled**: The feature was explicitly disabled in the CLI configuration.
- **No eligible sessions**: There are no BFD sessions configured that could be hardware accelerated. For example, all current BFD sessions have authentication enabled.
- **Not supported with SSO**: On certain modular systems, the feature is not supported when the redundancy protocol is configured to SSO.

The following example output of the command is when the hardware acceleration feature is not supported on a product:

```
Hardware acceleration is not supported
```

**Session Information**

Use the `show bfd peers detail` command to display whether an individual session is hardware accelerated or not. An additional line has been added to the command to display hardware acceleration as shown in the following example.

```
switch#show bfd peers detail
VRF name: default
-----------------
Peer Addr 10.0.0.2, Intf Ethernet3/1/1, Type normal, State Down
VRF default, LAddr 0.0.0.0, LD/RD 1157402594/0
Session state is Down and not using echo function
Hardware Acceleration: Async On, Echo On
...
```

**Async On** denotes the Asynchronous Transmit component of the session has been offloaded.

**Echo On** denotes the Echo Transmit function of the session has been offloaded.
Note: There is no guarantee that both the Asynchronous transmit component and the echo function will be offloaded together to the hardware.

Hardware Acceleration Summary

Use the `show bfd hardware utilization` command to display a summary of the number of offloaded discriminators per ASIC.

Example

```
switch#show bfd hardware utilization
Chip Name  Number Of Sessions    Maximum Number Of Sessions
---------- ------------------- --------------------------
Jericho0    20                    200
Jericho1    0                     200
```

Detailed Hardware Acceleration Information

Use the `show bfd hardware utilization detail` command to display a detailed list of the BFD discriminators whose transmit path is offloaded can be viewed per ASIC using:

Example

```
switch#show bfd hardware utilization detail
sh bfd hardware utilization detail
Chip: Jericho0
Dst Addr  My Disc    Interface    VRF      Type
--------- ---------- ------------ -------- -----
1.1.6.2   3175653802 Ethernet1/1  default  normal
1.1.3.2   1151992021 Ethernet2/1  default  normal

Chip: Jericho1
Dst Addr   My Disc    Interface    VRF      Type
--------- ---------- ------------ -------- -----
14.7.3.4  Tracing
By default, quick tracing is enabled for Bfd and SandBfd agents on supported platforms.
Beginning with **EOS Release 4.23.1F**, by default, quick tracing is enabled for the StrataBfd agent on supported platforms.

14.7.3.5 Limitations

The following limitations are associated with the Hardware Accelerated BFD Transmit feature.

- Hardware acceleration is not supported on certain modular systems configured with SSO redundancy protocol.
- Before **EOS Release 4.24.0F**, on 7500 series modular systems with both 7500E series and 7500R series line cards, hardware acceleration is not supported if the systems Forwarding Mode is Arad, as shown by `show platform sand compatibility` command display output. From the **EOS Release 4.24.0F** onwards, this does not apply because the 7500E series line cards are deprecated.
- Hardware acceleration is not supported on Port-Channel Sub-Interfaces.
- In the **EOS Release 4.23.0F**, hardware acceleration is not supported on L3 Sub-Interfaces.
- Hardware acceleration is not supported on Switched Virtual Interfaces.
- Hardware acceleration is not supported on Port-Channel interfaces (non-per-link BFD).
- Hardware acceleration is not supported on Loopback interfaces.
- Hardware acceleration is not supported on Tunnel interfaces.
• Hardware acceleration is not supported on front-panel or Port-Channel sub-interfaces.
• Hardware acceleration is not supported with Multi-hop BFD.
• Hardware acceleration is not supported when Authentication is enabled.
• Configuring authentication on an already offloaded session results in the session being migrated back to software. Similarly, deconfiguring authentication migrates the session to hardware if the session is hardware acceleration capable and if resources are available on the ASIC in question.
• Hardware acceleration limits the number of accelerated transmit discriminators to 200 per ASIC.
• Configuring more than 200 session discriminators on interfaces attached to an ASIC results in the additional session discriminators falling back to the default software transmit implementation, where the accuracy of transmit timers are dependent on the host CPU load.
• When enabling hardware acceleration with a high enough number of existing offload-capable software sessions, a flap in some sessions may be observed once at the time of migration from software to hardware.
• When disabling hardware acceleration with a high enough number of existing offloaded sessions, a flap in some sessions may be observed once at the time of migration from hardware to software.
• Sessions are offloaded to hardware in a first-come, first-served fashion. Currently, in an overflow scenario with more than 200 session discriminators per chip, there is no guarantee that shorter intervals are always offloaded.
14.7.4 **BFD Commands**

**BFD Configuration Command**
- `bfd echo`
- `bfd interval`
- `bfd local-address`
- `bfd neighbor`
- `bfd per-link`
- `bfd slow-timer`
- `hardware acceleration disabled`
- `session stats snapshot interval (BFD)`

**BFD Display Commands**
- `show bfd hardware acceleration`
- `show bfd hardware utilization`
- `show bfd peers`
- `show bfd peers detail`

**PIM-BFD Configuration Commands**
- `bfd (Router-PIM Sparse-mode)`
- `pim ipv4 bfd`

**BGP-BFD Configuration Commands**
- `neighbor bfd`

**VRRP-BFD Configuration Commands**
- `vrrp bfd ip`

**OSPF-BFD Configuration Commands**
- `bfd default (OSPF)`
- `ip ospf neighbor bfd`

**ISIS-BFD Configuration Commands**
- `isis bfd`
- `bfd default (ISIS)`
14.7.4.1 bfd (Router-PIM Sparse-mode)

The bfd (Router-PIM Sparse-mode) command enables Bidirectional Forwarding Detection (BFD) globally for use as a failure-detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM) on the switch. To override the global configuration for a specific interface, use the pim ipv4 bfd command. All PIM-SM interfaces will use the global setting if they are not individually configured.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The no bfd and default bfd commands disable PIM BFD globally by deleting the bfd statement from running-config. When this is done, only interfaces with PIM BFD explicitly enabled will use PIM BFD.

**Command Mode**

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
bfd
no bfd
default bfd
```

**Example**

- These commands enable PIM BFD globally on the switch in the default VRF, enabling it on all PIM-SM interfaces where it is not explicitly disabled.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#bfd
switch(config-router-pim-sparse-ipv4)#
```
14.7.4.2  bfd default (ISIS)

The **bfd default** command places the switch in address-family configuration mode.

The **bfd default** and **isis bfd** commands configure Bidirectional Forwarding Detection (BFD), a low overhead protocol designed to provide rapid detection of failures at any protocol layer in the path between adjacent forwarding engines over any media. BFD is supported for IS-IS IPv4 routes.

**Command Mode**

Router-Address-Family Configuration

**Command Syntax**

**bfd default**  **Example**

- These commands enable BFD for all the interfaces on which IS-IS is enabled. By default BFD is disabled on all the interfaces.

```bash
switch(config)#router isis 1
switch(config-router-isis)#address-family ipv4
switch(config-router-af)#bfd default
switch(config-router-af)#
```
14.7.4.3  bfd default (OSPF)

The bfd default command globally configures OSPF to use Bidirectional Forwarding Detection (BFD). When this command is issued, BFD sessions will be established with all OSPF neighbors connected to BFD-enabled interfaces unless OSPF BFD has been disabled on a participating interface using the ip ospf neighbor bfd command. BFD is globally disabled in OSPF by default.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the bfd interval command.

The no bfd default and default bfd default commands disable OSPF BFD on all interfaces except those where it has been explicitly enabled using the ip ospf neighbor bfd command.

Command Mode

Router-OSPF Configuration

Command Syntax

bdf default

no bfd default

default bfd default  Examples

These commands enable BFD for OSPF instance 100 on all interfaces except those on which OSPF BFD has been explicitly disabled.

```
switch(config)#router ospf 100
switch(config-router-ospf)#bfdf default
switch(config-router-ospf)#
```
14.7.4.4  bfd echo

The `bfd echo` command enables the BFD echo function on the configuration mode interface.

The `no bfd echo` and `default bfd echo` commands disable the BFD echo function by removing the corresponding `bfd echo` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration

**Command Syntax**

`bfd echo`

`no bfd echo`

`default bfd echo`

**Example**

- These commands enable the BFD echo function on Ethernet interface 5. If a slow-timer value has been configured on the switch, the minimum receive rate expected from the BFD neighbor will be reset to that value; otherwise, the minimum receive rate will be set to 2000 milliseconds.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd echo
switch(config-if-Et5)#
```
14.7.4  bfd interval

The `bfd interval` command configures the BFD control packet transmission rate, minimum control packet receive rate, and the number of missed packets that will signal that the session is down. These parameters can be configured globally for the switch or for the configuration mode interface. If a parameter is configured both globally and on the interface, the value configured on the interface takes precedence.

**Note:** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The `no bfd interval` and `default bfd interval` commands return the BFD parameters on the configuration mode interface to default values by removing the corresponding `bfd interval` command from `running-config`.

**Command Mode**

Global Configuration Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration

**Command Syntax**

```
bfd interval  transmit_rate  min_rx  receive_minimum  multiplier  factor
no bfd interval
default bfd interval
```

**Parameters**

- `transmit_rate` rate in milliseconds at which control packets will be sent. Values range from 50 to 60000; the default value is 300.
- `receive_minimum` rate in milliseconds at which control packets will be expected. Values range from 50 to 60000.
- `factor` number of consecutive missed BFD control packets after which BFD will declare the session as down. Values range from 3 to 50.

**Examples**

- These commands configure BFD on Ethernet interface 5 to expect packets from the peer every 200 milliseconds and declare the session down after failing to receive 5 consecutive packets. This configuration overrides any values configured globally.

```
switch(config)#interface ethernet 5
switch(config-if-Et5)#bfd interval 200 min_rx 200 multiplier 5
switch(config-if-Et5)#
```
14.7.4.6 bfd local-address

The bfd local-address command specifies the local L3 address for use in Bidirectional Forwarding Detection (BFD). When configuring an L2 interface, specification of a local L3 address is required in order to run BFD per-link in RFC 7130 mode. (This is not necessary when configuring an L3 interface with an IP address configured on the port channel.)

The no bfd local-address and default bfd local-address commands remove the local L3 address by removing the corresponding bfd local-address command from running-config.

Command Mode
Global Configuration

Command Syntax

```
bfd local-address address
no bfd local-address [ address]
default bfd local-address [ address]
```

Parameters

address local IPv4 or IPv6 address for BFD.

Example

- This command specifies the local L3 address for BFD.

```
switch(config)#bfd local-address 10.0.0.4
switch(config#)
```
14.7.4.7  bfd neighbor

The `bfd neighbor` command specifies the L3 address of the BFD neighbor of the port channel being configured. This is required to run BFD per-link in RFC 7130 mode. For an L2 port channel, this address should be the BFD per-link "local address" globally configured on the peer switch. For an L3 port channel, this address should be the IP address configured on the peer port channel.

The `no bfd neighbor` and `default bfd neighbor` commands remove the BFD neighbor address by removing the corresponding `bfd neighbor` command from `running-config`.

Command Mode

Interface-Port-channel Configuration

Command Syntax

```
bfd neighbor  address
no bfd neighbor  [address
default bfd neighbor [address
```

Parameters

`address` IPv4 or IPv6 address of the port channel's BFD neighbor.

Example

- These commands specify the L3 address of the port channel's BFD neighbor.

```
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd neighbor 10.0.0.5
switch(config-if-Po5)#
```
14.7.4.8 bfd per-link

The **bfd per-link** command enables the BFD per-link function on the port channel being configured. When BFD per-link is enabled, BFD sub-sessions are run on each link of the port channel; BFD considers the port-channel to be up as long as any one of the links is live.

BFD per-link runs by default in legacy mode, which allows downed links to remain members of the port channel and relies on LACP or other means to prune the dead links. Legacy mode is provided for interoperability with older switches.

RFC 7130 mode runs BFD per-link in full compliance with RFC 7130, and automatically removes links in down state from the port-channel, then adds them back again when they come up. Use the **rfc-7130** keyword to enable per-link in RFC 7130 mode. You must also configure an L3 BFD neighbor address for each port-channel running RFC 7130 per-link using the **bfd neighbor** command. When configuring an L2 interface, you must also globally configure a local L3 BFD address on the switch using the **bfd local-address** command.

For the BFD session to come up, both peers must be configured in the same way (either RFC-7130 or legacy mode).

The **no bfd per-link** and **default bfd per-link** commands disable the BFD per-link function by removing the corresponding **bfd per-link** command from **running-config**.

**Command Mode**

Interface-Port-channel Configuration

**Command Syntax**

```
bfd per-link [rfc-7130]
no bfd per-link [rfc-7130]
default bfd per-link [rfc-7130]
```

**Example**

- These commands enable the BFD per-link function in legacy mode on port channel 5.

```
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link
switch(config-if-Po5)#
```

- These commands globally specify a local L3 BFD address for the switch, enable the BFD per-link function in RFC 7130 mode on port channel 5, and specify the L3 address of the port channel's BFD neighbor.

```
switch(config)#bfd local-address 10.0.0.5
switch(config)#interface port-channel 5
switch(config-if-Po5)#bfd per-link rfc-7130
switch(config-if-Po5)#bfd neighbor 10.0.0.4
switch(config-if-Po5)#
```
14.7.4.9 bfd slow-timer

The **bfd slow-timer** command configures the minimum reception rate for BFD control packets which will be used if the BFD echo function is enabled. The default value is 2000 milliseconds.

**Note:** For a BFD session to be established, BFD must be enabled for any routing protocol using BFD for failure detection.

The **no bfd slow-timer** and **default bfd slow-timer** commands return the BFD slow-timer to the default value of 2000 milliseconds by removing the corresponding **bfd interval** command from **running-config**.

**Command Mode**
Global Configuration

**Command Syntax**

```
bfd slow-timer  receive_minimum
no bfd slow-timer
default bfd slow-timer
```

**Parameters**
- **receive_minimum** rate in milliseconds at which control packets will be expected when the BFD echo function is enabled. Values range from 2000 to 60000; default value is 2000.

**Examples**
- This command configures BFD to expect control packets from the peer every 10000 milliseconds when the BFD echo function is enabled.

```
switch(config)#bfd slow-timer 10000
switch(config)#
```
14.7.4.10  hardware acceleration disabled

Hardware acceleration is enabled by default on supported platforms and no explicit configuration is needed. Use the `hardware acceleration disabled` command to disable hardware acceleration.

**Command Mode**

BFD configuration mode

**Command Syntax**

`hardware acceleration disabled`

**Example**

```
switch(config-router-bfd)#hardware acceleration disabled
```
14.7.4.11 ip ospf neighbor bfd

The `ip ospf neighbor bfd` command enables Bidirectional Forwarding Detection (BFD) for the open shortest path first protocol (OSPF) on the configuration mode interface regardless of the global settings for the OSPF instance. All OSPF neighbors associated with the interface become BFD peers, and OSPF uses BFD for failure detection.

For OSPF BFD to function on an interface, BFD must also be enabled and configured on that interface using the `bfd interval` command.

The `no ip ospf neighbor bfd` command disables OSPF BFD on the interface and terminates all BFD sessions with the interface OSPF peers. The `default ip ospf neighbor bfd` command causes the interface to follow global OSPF BFD settings configured by the `bfd default (OSPF)` command.

**Command Mode**

Interface-Ethernet Configuration Interface-Port-Channel Configuration Interface-VLAN Configuration

**Command Syntax**

- `ip ospf neighbor bfd`
- `no ip ospf neighbor bfd`
- `default ip ospf neighbor bfd`

**Example**

- These commands enable BFD on Ethernet interface 3/20.

  ```
  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#ip ospf neighbor bfd
  switch(config-if-Et3/20)#
  ```

- These commands cause Ethernet interface 3/20 to follow the global OSPF BFD configuration.

  ```
  switch(config)#interface ethernet 3/20
  switch(config-if-Et3/20)#default ip ospf neighbor bfd
  switch(config-if-Et3/20)#
  ```
14.7.4.12  isis bfd

The **isis bfd** command activates the corresponding IS-IS routing instance on the configuration mode interface. By default, the IS-IS routing instance is not enabled on an interface.

The **no isis enable** and **default isis enable** commands disable IS-IS on the configuration mode interface by removing the corresponding **isis enable** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- **isis bfd**
- **no isis bfd**
- **default isis bfd**

**Examples**

- These commands enable BFD on IS-IS interfaces.

```
switch(config)# interface Ethernet 5/6
switch(config-if-Et5/6)# isis bfd
switch(config-if-Et5/6)#
```
The **neighbor bfd** command enables Bidirectional Forwarding Detection (BFD) for use as a failure detection mechanism for border gateway protocol (BGP) connections to the specified BGP neighbor or peer group.

Once a BFD session is established with a BGP neighbor, if the BFD session goes down the status of the BGP session is changed to down as well.

The **no neighbor bfd** and **default neighbor bfd** commands disable BFD for BGP connections to the specified neighbor or peer group by removing the corresponding **neighbor bfd** command from **running-config**.

**Command Mode**
Router-BGP Configuration

**Command Syntax**

```
neighbor  NEIGHBOR_ID  bfd
no neighbor  NEIGHBOR_ID  bfd
default neighbor  NEIGHBOR_ID  bfd
```

**Parameters**

- **NEIGHBOR_ID** IP address or peer group name. Values include:
  - *ipv4_addr* neighbor IPv4 address.
  - *ipv6_addr* neighbor IPv6 address.
  - *group_name* peer group name.

**Example**

These commands enable BFD failure detection for BGP connections with the neighbor at 10.13.64.1.

```
switch(config)#router bgp 300
switch(config-router-bgp)#neighbor 10.13.64.1 bfd
switch(config-router-bgp)#
```
## 14.7.4.14  pim ipv4 bfd

The `pim ipv4 bfd` command enables Bidirectional Forwarding Detection (BFD) on the configuration mode interface as a failure detection mechanism for Protocol-Independent Multicast Sparse-Mode (PIM-SM). To enable PIM BFD globally on the switch, use the `bfd` (Router-PIM Sparse-mode) command. Interface-level settings override the global setting.

When PIM BFD is enabled, a BFD session is created for each PIM-SM neighbor and used to detect a loss of connectivity with the neighbor. PIM-SM hello packets are still exchanged with PIM-SM neighbors when BFD is enabled.

The `no pim ipv4 bfd` command disables PIM BFD on the configuration mode interface regardless of global settings. The `default pim ipv4 bfd` command causes the configuration mode interface to follow the global setting for PIM BFD by removing the corresponding `pim ipv4 bfd` statement from `running-config`.

### Command Mode

<table>
<thead>
<tr>
<th>Interface-Ethernet Configuration</th>
<th>Interface-Port-Channel Configuration</th>
<th>Interface-VLAN Configuration</th>
</tr>
</thead>
</table>

### Command Syntax

- `pim ipv4 bfd`
- `no pim ipv4 bfd`
- `default pim ipv4 bfd`

### Example

- These commands configure VLAN interface 200 to use BFD for PIM-SM connection failure detection regardless of the global PIM BFD configuration.

```
switch(config)#interface vlan 200
switch(config-if-VL200)#pim ipv4 bfd
switch(config-if-VL200)#
```
14.7.4.15 show bfd hardware acceleration

The `show bfd hardware acceleration` command displays the status of hardware acceleration on the switch for Bidirectional Forwarding Detection (BFD) session. The `show bfd peers detail` command displays the status of hardware acceleration.

**Command Mode**

EXEC

**Command Syntax**

`show bfd hardware acceleration`

<table>
<thead>
<tr>
<th>Description</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>This command displays the status for hardware acceleration for BFD.</td>
<td><code>switch#show bfd hardware acceleration</code></td>
</tr>
<tr>
<td>Output when hardware acceleration is enabled (default) and running</td>
<td><code>Hardware acceleration is running</code></td>
</tr>
<tr>
<td>Output when hardware acceleration is disabled with explanation</td>
<td>`Hardware acceleration is not running:</td>
</tr>
<tr>
<td>user disabled, no eligible sessions, not supported with SSO</td>
<td><code>user disabled, no eligible sessions, not supported with SSO</code></td>
</tr>
<tr>
<td>Output when hardware acceleration is not supported by switch</td>
<td><code>Hardware acceleration is not supported</code></td>
</tr>
</tbody>
</table>
14.7.4.16  show bfd hardware utilization

The `show bfd hardware utilization` command displays the status of hardware acceleration on the switch for Bidirectional Forwarding Detection (BFD) session.

**Command Mode**

EXEC

**Command Syntax**

```
show bfd hardware utilization [INFO_LEVEL]
```

**Parameters**

- INFO_LEVEL amount of information that is displayed. Options include:
  - `<no parameter>` command displays a summary of offloaded discriminators per ASIC.
  - `detail` command displays details of the BFD discriminators whose transmit path is offloaded per ASIC.

This command displays a summary of offloaded discriminators per ASIC for BFD.

```
switch#show bfd hardware utilization
Chip Name        Number Of Sessions    Maximum Number Of Sessions
--------------- ------------------------ ---------------
               ------------------------ ---------
Jericho0         20                      200
Jerichol         0                       200
```

This command displays a details list of offloaded discriminators per ASIC for BFD.

```
switch#show bfd hardware utilization detail
sh bfd hardware utilization detail
Chip: Jericho0
Dst Addr       My Disc    Interface       VRF       Type
-------------- ------------- ------------------- ---------- ----
1.1.6.2         3175653802  Ethernet1/1     default   normal
1.1.3.2         1151992021  Ethernet2/1     default   normal
Chip: Jerichol
Dst Addr        My Disc    Interface       VRF     Type
--------------- ------------- ---------------- ---
```

This command displays a summary of offloaded discriminators per ASIC for BFD.
14.7.4.17  show bfd peers

The `show bfd peers` command displays information about the neighbors with which the switch currently has a Bidirectional Forwarding Detection (BFD) session.

**Command Mode**
EXEC

**Command Syntax**
`show bfd peers [INFO_LEVEL]`

**Parameters**
- INFO_LEVEL amount of information that is displayed. Options include:
  - <no parameter> command displays data block for each specified interface.
  - detail command displays table that summarizes interface data.
  - summary displays the summary of the interface.
- **Display Values**
  - **DstAddr** IP address of the BFD neighbor.
  - **MyDisc** Local discriminator value of the BFD session.
  - **YoDisc** Neighbor’s discriminator value for the BFD session.
  - **If** Interface to which the neighbor is connected.
  - **LUp** Last up.
  - **LDown** Last down.
  - **Ldiag** Diagnostic for the last change in session state.
  - **State** State of the BFD session.
  - **TxInt** Transmit interval of the local interface.
  - **RxInt** Minimum receive interval set on the local interface.
  - **Multiplier** Local multiplier (number of packets that must be missed to declare session down).
  - **Received RxInt** Minimum receive interval set on the neighbor interface.
  - **Received Multiplier** Neighbor’s multiplier (number of packets that must be missed to declare session down).
  - **Rx Count** BFD control packets transmitted.
  - **Tx Count** BFD control packets received.
  - **Detect** Time Total time in milliseconds it takes for BFD to detect connection failure.
  - **Registered Protocols** Protocols using BFD with this neighbor.

**Examples**
- This command displays general information about BFD neighbors.

```
switch>show bfd peers
DstAddr MyDisc YoDisc If LUp LDown Ldiag State
10.168.1.56   16 13 et52_1(81) 17151450 0 No Diagnostic Up
10.168.1.58   17 14 et52_2(65) 17151883 0 No Diagnostic Up
10.168.1.24   18 15 et51_1(73) 17152175 0 No Diagnostic Up
10.168.254.6  19 12 vlan4094(26) 17152336 0 No Diagnostic Up
10.168.1.26   20 16 et51_2(57) 17152523 0 No Diagnostic Up
10.168.1.40   21 12 et50_1(77) 17152966 0 No Diagnostic Up
10.168.1.42   22 13 et50_2(61) 17153488 0 No Diagnostic Up
```
• This command displays detailed information about BFD neighbors.

    switch>show bfd peers detail

14.7.4.18  show bfd peers detail

Use the **show bfd peers detail** to display whether an individual session is hardware accelerated or not. An extra line has been added to to highlight hardware acceleration.

**Command Mode**
EXEC

**Command Syntax**
`show bfd peers detail`

**Parameters**

detail Displays a comprehansive view of the individual session.

**Guidelines**

- **Async On** Denotes the Asynchronous Transmit component of the session has been offloaded.
- **Echo On** Denotes the Echo Transmit function of the session has been offloaded.

> **Note:** There is no guarantee that both the Asynchronous transmit component and the echo function are offloaded to hardware together.

**Example**

```
switch#show bfd peers detail
VRF name: default
----------------
Peer Addr 10.0.0.2, Intf Ethernet3/1/1, Type normal, State Down
VRF default, LAddr 0.0.0.0, LD/RD 1157402594/0
Session state is Down and not using echo function
**Hardware Acceleration: Async On, Echo On**
...```

14.7.4.19  session stats snapshot interval (BFD)

The *session stats snapshot interval* enables the BFD session telemetry on a switch. By default, this command is disabled and the telemetry interval is set to zero seconds. A telemetry interval between 10 and 3600 seconds may be configured. A telemetry interval may be configured to a value less than 10 seconds and as small as 1 second using an additional keyword `dangerous`.

**Note:** Configurations including a telemetry interval of less than 10 seconds are not advised for systems with a large-scale BFD deployment as this may cause delays in the rbfd kernel module and result in BFD session instability.

The `no session stats snapshot interval` and `default session stats snapshot interval` commands disables the BFD telemetry command from the running-config and sets the telemetry interval is set to zero.

**Command Mode**

Router BFD Configuration

**Command Syntax**

```
session stats snapshot interval timer_interval dangerous
no session stats snapshot interval
default session stats snapshot interval
```

**Parameters**

- `timer_interval` Session statistics timer interval in seconds between 10-3600.
- `dangerous` Set session statistics timer interval less than 10 seconds.

**Examples**

- The following commands places the switch in router BFD mode and enables the BFD session telemetry. In this example a BFD telemetry session with a time interval of 10 seconds is configured.

  ```
  switch(config)#router bfd
  switch(config-router-bfd)#session stats snapshot interval 10
  ```

- In this example a BFD telemetry session with a time interval of 1 seconds is configured using a keyword "dangerous".

  ```
  switch(config-router-bfd)#session stats snapshot interval dangerous 1
  ```
14.7.4.20 vrrp bfd ip

The `vrrp bfd ip` command enables and configures Bidirectional Forwarding Detection (BFD) for virtual router redundancy protocol (VRRP) on the configuration mode interface.

When enabled, BFD provides failure detection for a 2-router VRRP system. When the master is configured with the physical IP address of the backup router, and the backup is configured with the address of the master, a BFD session is established between them. If the BFD session goes down, the backup router immediately assumes the master role.

VRRP master advertisement packets are still sent even when the BFD session is established to accommodate VRRP systems involving more than two routers.

The `no vrrp bfd ip` and `default vrrp bfd ip` commands disable BFD for VRRP on the configuration mode interface by removing the corresponding `vrrp bfd ip` statement from running-config. The `no vrrp` command also removes the `vrrp bfd ip` command for the specified virtual router.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```plaintext
vrrp group bfd ip ipv4_address
no vrrp group bfd ip
default vrrp group bfd ip
```

**Parameters**

- `group` virtual router identifier (VRID). Values range from 1 to 255.
- `ipv4_address` IPv4 address of the other VRRP router. On the master router, enter the physical IP address of the backup; on the backup, enter the physical IP address of the master.

**Example**

- These commands enable BFD on Ethernet interface 3/20 for VRRP ID 15 with a connection to a router at IP address 192.168.2.1.

```plaintext
switch(config)#interface ethernet 3/20
switch(config-if-Et3/20)#vrrp 15 bfd ip 192.168.2.1
switch(config-if-Et3/20)#
```
Chapter 15

Multicast

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Sections covered in this chapter include:

- Multicast Architecture
- IGMP and IGMP Snooping
- Protocol Independent Multicast
- Multicast Source Discovery Protocol (MSDP)
- Audio Video Bridging (AVB)

15.1 Multicast Architecture

IP multicast is the transmission of data packets to multiple hosts through a common IP address. Arista switches support multicast transmissions through IGMP, IGMP Snooping, and PIM-SM. These topics describe the Arista multicast architecture.

- Overview
- Multicast Architecture Description
- Multicast Listener Discovery (MLD)
- MLDv2 Snooping
- Multicast Route Counters
- Static IP Mroute
- Configuring Multicast
- Multicast Commands

15.1.1 Overview

Arista switches provide layer 2 multicast filtering and layer 3 routing features for applications requiring IP multicast services. The switches support over a thousand separate routed multicast sessions at wire speed without compromising other layer 2/3 switching features. Arista switches support IGMP, IGMP snooping, PIM-SM, and MSDP to simplify and scale data center multicast deployments.

Supported Features

Feature support varies by platform; consult the release notes for multicast support information by platform.

Multicast and unicast use the same routing table. Unicast routes use TCAM resources, which may also impact the maximum number of multicast routes.

Features Not Supported

The multicast functions not supported by Arista switches include (*.*,G) forwarding or boundary routers, multicast MIBs, and router applications joining multicast groups.

15.1.2 Multicast Architecture Description

IP multicast is data transmission to a subset of all hosts through a single multicast group address. Multicast packets are delivered using best-effort reliability, similar to unicast packets. Senders use the
multicast address as the destination address. Any host, regardless of group membership, can send to a group. However, only group members receive messages sent to a group address.

IP multicast addresses range from 224.0.0.0 to 239.255.255.255. Multicast routing protocol control traffic reserves the address range 224.0.0.0 to 224.0.0.255. The address 224.0.0.0 is never assigned to any group.

Multicast group membership is dynamic; a group's activity level and membership can vary over time. A host can also simultaneously belong to multiple multicast groups.

Multicast Architecture depicts the components that comprise the multicast architecture. The remainder of this section describes the multicast components depicted in the figure.

![Multicast Architecture Diagram](image)

**Figure 61: Multicast Architecture**

### 15.1.2.1 Multicast Control Plane

The multicast control plane builds and maintains multicast distribution trees. It communicates changes in the multicast routing table to the MFIB for multicast forwarding.

- Protocol Independent Multicast (PIM) builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table.
- Internet Group Management Protocol (IGMP) identifies multicast group members on subnets directly connected to the switch. Hosts manage multicast group membership with IGMP messages.
- The switch maintains an mroute (multicast routing) table when running PIM to provide forwarding tables used to deliver multicast packets.

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

### 15.1.2.2 Multicast Routing Information Base (MRIB)

The MRIB is the channel between multicast control plane clients and the multicast forwarding plane. The `show ip mroute` command displays MRIB entries as (*, G), (S, G), and (*, G/m) multicast entries.
MRIB entries are based on source, group, and group masks. The entries are associated with a list of interfaces whose forwarding state is described with flags. MRIB communication is based on the state change of entry and interface flags. Flags are significant to MRIB clients but are not interpreted by the MRIB.

15.1.2.3 Multicast Forwarding Plane

The multicast forwarding plane consists of the multicast forwarding information base (MFIB), a forwarding engine that is independent of multicast routing protocols.

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

MFIB uses a core forwarding engine for interrupt-level (fast switching) and process-level (process switching) forwarding. MFIB fast-switches inbound multicast packets that match an MFIB forwarding entry and process-switches packets requiring a forwarding entry if a matching entry does not exist.

15.1.2.4 Hardware Dependent Forwarding and Fast Drop

In IP multicast protocols, each (S,G) and (*,G) route corresponds to an inbound reverse path forwarding (RPF) interface. Packets arriving on non-RPF interfaces may require PIM processing, as performed by the CPU subsystem software.

By default, hardware sends all packets arriving on non-RPF interfaces to the CPU subsystem software. However, the CPU can be overwhelmed by non-RPF packets that do not require software processing. The CPU subsystem software prevents CPU overload by creating a fast-drop entry in hardware for inbound non-RPF packets not requiring PIM processing. Packets matching a fast-drop entry are bridged in the ingress VLAN but not sent to the software, avoiding CPU subsystem software overload. Fast-drop entry usage is critical in topologies with persistent RPF failures.

Protocol events, such as links going down or unicast routing table changes, can change the set of packets that can be fast dropped. Packets that were correctly fast dropped before a topology change may require forwarding to the CPU subsystem software after the change. The CPU subsystem software handles fast-drop entries that respond to protocol events so that PIM can process all necessary non-RPF packets.

15.1.3 Multicast Listener Discovery (MLD)

Networks use Multicast Listener Discovery (MLD) to control the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

In an MLD Report or Done message, the multicast address field holds a specific IPv6 multicast address to which the message sender is listening or is ceasing to listen, respectively.

15.1.3.1 Platform Compatibility

- 7280R
- 7500R

15.1.3.2 MLDv2 Snooping

MLDv2 Snooping optimizes the transmission of multicast packets in Layer 2 by using Layer 3 information contained in MLDv2 and PIM packets. MLDv2 is the protocol used to manage the membership of hosts in multicast groups for IPv6.
RFC 3810 talks about MLDv2 functionality. MLDv2 is the IPv6 counterpart of IGMPv3. Beginning with EOS Release 4.25.0F, MLDv2 snooping is supported on MLAG deployments.

15.1.3.2.1 Platform Compatibility

The following platforms support MLDv2 snooping:

- DCS-7020R
- DCS-7280R
- DCS-7280R2
- DCS-7500R
- DCS-7500R2

15.1.3.2.2 Limitations

- Extraneous “Switch” interface should be ignored in `show mld snooping counters` and `show mld snooping counters errors` command outputs.
- MLDv2 Snooping with EVPN is not supported.

15.1.3.3 Configuring Multicast Listener Discovery

15.1.3.3.1 Enabling MLD

Use `mld` command to enable MLD on an interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the MLD group. By default, MLD is disabled on an interface.

**Examples**

- This command enables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#mld
```

- This command disables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#no mld
```

15.1.3.3.2 Configuring MLD

An interface that runs MLD uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

**MLD**

The switch supports MLD versions 1 through 2. The `mld` command configures multicast routers on the configuration mode interface. Version 2 is the default MLD version.

**Example**

- This command enables MLD on the Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#mld
```
Multicast

Startup Query
Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The `mld startup-query-interval` command specifies the interval between membership queries that an interface sends immediately after it starts up. The `mld startup-query-count` command specifies the number of queries that the switches sends from the interface at the startup interval rate.

Examples
- This command configures the startup query count of 4 on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld startup-query-count 4
  ```
- This command configures the startup query interval of 100 seconds on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld startup-query-interval 100
  ```

Membership Queries
The router with the lowest IP address on a subnet sends membership queries as the MLD querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `mld query-interval` command configures the frequency at which the active interface, as an MLD querier, sends membership query messages.

The `mld query-response-interval` command configures the time that a host has to respond to a membership query.

Examples
- This command configures the query interval of 30 seconds on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld query-interval 30
  ```
- This command configures the query response interval of 30 seconds on an Ethernet interface 1.
  ```
  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld query-response-interval 30
  ```

Last Member Query
When the querier receives an MLD leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `mld last-listener-query-count` command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `mld last-listener-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.
Examples

- This command configures the last listener query count to 3 on an Ethernet interface 1.

  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#mld last-listener-query-count 3
  ```

- This command configures the last listener query interval to 2 seconds on an Ethernet interface 1.

  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#mld last-listener-query-interval 2
  ```

Static Groups

The `mld static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

Example

- This command configures static groups on an interface Ethernet 1.

  ```
  switch(config)#interface Ethernet 1
  switch(config-if-Et1)#mld static-group ff30::1 a::1
  ```

15.1.3.4 MLDv2 Snooping Configuration

15.1.3.4.1 Enabling or Disabling MLDv2 Snooping

You can configure MLDv2 snooping globally and per VLAN. A configuration mode is available for MLD related snooping commands in the global configuration mode.

Example

```
switch(config)#mld snooping
switch(config-mld-snooping)#disabled
switch(config-mld-snooping)#vlan 1-100
switch(config-mld-snooping)#vlan 101
switch(config-mld-snooping-vlan-101)#disabled
```

Items to consider:

- You must explicitly configure VLANs inside the mld-snooping configuration mode to enable snooping for those VLANs.
- Use the global `disabled` to disable the mld-snooping for all VLANs. `disabled` is *not* configured by default.
- Snooping can be explicitly `disabled` for a given VLAN. This is useful once there is configuration within the VLAN. `disabled` is not configured by default.
- Snooping cannot be explicitly enabled for a given VLAN if it is disabled globally.
- Beginning with the **EOS Release 4.25.0F**, it allows the configuration of MLDv2 snooping on PIM non DR (Designated Router) VLANs.
15.1.3.4.2 Static Groups and Multicast Router

To configure static groups, refer to the following commands:

```
switch(config)#mld snooping
switch(config-mld-snooping)#vlan 100
switch(config-mld-snooping-vlan-100)#member ipv6-group-addr
    interface intfs
```

To configure a static multicast router, refer to the following commands:

```
switch(config)#mld snooping
switch(config-mld-snooping)#vlan 100
switch(config-mld-snooping-vlan-100)#multicast-router
    interface intfs
```

In the examples above, `intfs` can be a group of similar interfaces (for example, `Ethernet1-5,8` or `port-channel 1-5,8`).

15.1.3.5 Displaying MLDv2 Snooping Status

The following show commands display the MLD snooping status of the switch:

```
switch#show mld snooping
    Global MLD Snooping configuration:
    -------------------------------------------
    MLD snooping                   : Enabled
    Robustness variable            : 2

    VLAN 1 :
    --------
    MLD snooping                   : Disabled
    MLD max group limit            : No limit set
    Recent attempt to exceed limit : No
    MLD snooping pruning active    : False
    Flooding traffic to VLAN       : True

    VLAN 100 :
    --------
    MLD snooping                   : Enabled
    MLD max group limit            : No limit set
    Recent attempt to exceed limit : No
    MLD snooping pruning active    : True
    Flooding traffic to VLAN       : False
```

```
switch#show mld snooping
    Global MLD Snooping configuration:
    -------------------------------------------
    MLD snooping                   : Enabled
    Robustness variable            : 2

    VLAN 1 :
    --------
    MLD snooping                   : Disabled
    MLD max group limit            : No limit set
```

2669
Recent attempt to exceed limit : No
MLD snooping pruning active    : False
Flooding traffic to VLAN       : True
VLAN 100 :
--------
MLD snooping                   : Enabled
MLD max group limit            : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active    : True
Flooding traffic to VLAN       : False

- Use the `show mld snooping groups` command to display MLDv2 snooping by group.

```
switch#show mld snooping groups
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group            Members
----  ---------------  ------------------------
100   ff05::2          Cpu, Et4
100   ff08::11         Et1
100   ff08::21         Et2
100   ff08::31         Et3
100   *                Et3, Et4
```

- Use the `show mld snooping groups detail` command to display detailed MLDv2 snooping information.

```
switch(config-mld-snooping-vlan-100)#show mld snooping groups detail
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group            Source     Mode  Uptime       Members
----  ---------------  ---------  ----  -----------  ----------
100   ff05::2          *           -     0d00h13m20   Cpu, Et4
100   ff08::11         *           -     0d00h13m17   Et1
100   ff08::21         1::1        IN    0d00h13m20   Et2
100   ff08::31         2::1        EX    0d00h01m31   Et3
100   *                *            -     -           Et3, Et4
```

“show mld snooping groups” output can be further filtered to output just the

- **local** groups, that is groups learned locally using the `show mld snooping groups local` command.
- **user** groups, that is groups configured by user.
- **mlag** groups, that is groups learned from the MPLAG peer.

- Use the `show mld snooping mrouter` command to display MLDv2 muliticast router information.

```
switch#show mld snooping mrouter
Vlan    Interface-ports
---------------------------
100     Et3(dynamic), Et4(static)
```

- Use the `show mld snooping mrouter detail` command to display detailed MLDv2 muliticast router information.

```
switch#show mld snooping mrouter detail
Vlan    Intf      Address           FirstHeard   LastHeard    Expires
Type    ------------------------

  Et1   0        0        0            0        0        0        0        0        0        0
  Et2   0        0        0            0        0        0        0        0        0        0
  Et3   0        0        0            0        0        0        0        0        0        0
  Et4   0        0        0            0        0        0        0        0        0        0
  Switch 0        0        0            0        0        0        0        0        0        0
```

## 15.1.4 Multicast Route Counters

Multicast Route Counters provides per multicast route ingress packet and byte counters for multicast routed packets.

### 15.1.4.1 Platform Compatibility

The following platforms support Multicast Route Counters:

- DCS-7020R
15.1.4.2 Configuration

To enable multicast route ingress packet and byte counters use the following command:

```
switch(config)#hardware counter feature multicast ipv4
```

To disable multicast route ingress packet and byte counters use the following command:

```
switch(config)#no hardware counter feature multicast ipv4
```

On DCS-7020R, DCS-7280R/R2 and 7500R/R2 platforms, create and apply user defined TCAM profile with multicast counter feature db enabled. This example reates a profile copying it from the default, then modifying the profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile <profileName> copy default
switch(config-hw-tcam-profileName)#feature counter multicast ipv4
switch(config-hw-tcam-profileName-feature-counter-multicast-ipv4))#exit
switch(config-hw-tcam-profileName)#no feature mirror ip
switch(config-hw-tcam-profileName)#exit
switch(config-hw-tcam)#system profile <profileName>
```

15.1.4.3 Show Commands

Use the `show ip mfib counters` command to display per multicast route ingress packet and byte counters:

```
switch#show ip mfib 225.1.2.1 10.46.1.2 counters
Activity poll time: 60 seconds
  225.1.2.1 10.46.1.2
    Byte: 1200200
    Packet: 12002
    Ethernet46 (iif)
    Ethernet47
    Activity 0:02:52 ago
switch#
```

```
switch#show ip mfib counters
Activity poll time: 60 seconds
  225.1.1.1 0.0.0.0/0
    Byte: 234100
    Packet: 2341
    1 (rpaindex)
    Ethernet21
    Ethernet23
    Activity 1:00:52 ago
  225.1.2.1 10.46.1.2
    Byte: 1200200
```

2672
To clear all counters including per multicast route ingress counters, use the `clear counters` command.

```
switch#clear counters
```

To clear per multicast route ingress counters or clear counters for a particular multicast route, use the `clear ip multicast counters` command.

```
switch#clear ip multicast <vrf [vrf-name]> counters <group_addr> <source_addr>
```

### 15.1.4.4 Syslog Messages

On platforms supporting the feature, 16 counter engines are available. Each engine can hold 4K counters on the DCS-7020R, and 16K on rest of the platforms. When the feature is configured and counter engines are not available, the output of the `show hardware counter feature` command does not have a `Multicast-IPv4` in line. Instead, the following Syslog is observed:

```
%DATAPLANE-4-COUNTER_RESOURCE_FULL: Hardware resources are insufficient to enable counters for feature Mcast
```

Once you free up counter resources by disabling features that are utilizing the counters banks, then this feature is automatically enabled and you no longer see the Syslog message.

```
%DATAPLANE-4-COUNTER_RESOURCE_CONFLICT: Counter resource conflict between MplsLfib and Mcast
```

The feature is automatically active upon removing the conflicting counter feature.

### 15.1.4.5 Troubleshooting

Possible troubleshooting issues and remedies:

- Review the output of `show hardware counter feature` to see the status of the feature.

**Example**

```
switch#show hardware counter feature
Feature Direction Counter Resource (Engine)
```
Multicast-IPv4 in XXXXX: XXXXX

- Use the no hardware counter feature <FEATURE> CLI command to free resource(s) used by other counter feature(s).
- Review the output of show hardware tcam profile command to see the status of the user defined Tcam profile.

Example

```
switch# show hardware tcam profile
Configuration Status
---------- -----------
XXXXXX <profileName> <profileName>
```

- On the DCS-7020R, DCS-7280R/R2 and 7500R/R2 platforms, in case counters are not incremented, run the show hardware tcam profile <profileName> detail | grep multicast command to ensure counter multicast ipv4 exists in the output.

```
switch# show hardware tcam profile <profileName> detail | grep multicast
Feature counter multicast ipv4
```

15.1.4.6 Limitations

This feature contains the following limitations:

- Counters are not supported on fastdrop multicast routes.
- For Pim sparse mode, counters are supported only on (Source_addr, Group_addr) multicast routes.
- Counting is supported for IPv4 multicast packets only.

15.1.5 Static IP Mroute

The Static IP Multicast route (or Static Mroute) interface overrides the interface that is ordinarily selected from the matching route in the unicast routing table, providing a means for breaking dependency on the unicast topology for the multicast topology. Let us assume that, PIM routers in a multicast network sends PIM joins towards a source to receive traffic from that source. The interface on which to send a PIM join is determined by looking up the unicast routing table for the source address. This interface is the upstream or RPF interface for that source. When traffic is received from that source, it is ensured it is received on the RPF interface for that source. This mechanism causes multicast traffic to take the same path through a network as unicast traffic would. In some cases, it is desirable to have the multicast traffic take a different path than the unicast traffic. For example, to avoid a slow firewall required for unicast traffic but not for multicast traffic or to receive multicast across a low latency, low bandwidth microwave link while unicast traverses a higher latency, higher bandwidth fiber path.

To overcome this situation, a static IP multicast route (or static mroute) command ip mroute command is introduced. The ip mroute command specifies a candidate for the RPF interface of any (S,G) multicast route where the source falls within the given source/mask. This interface potentially overrides the interface that would ordinarily have been selected from the matching route in the unicast routing table. This command, therefore, provides a means of breaking the dependence of the multicast topology on the unicast topology. The method of selecting the RPF interface for an (S,G) route is described next.
Example

- This command configures a Static IP mroute for a source 1.1.1.1/32 with an administrative distance 20 on a Ethernet interface 2/1.

```
switch(config)#ip mroute 1.1.1.1/32 ethernet 2/1 20
```

15.1.5.1 Selecting Static Mroute

The Static Mroute is selected based on the following parameters:

- Longest Match
- Administrative Distance
- Interface Status

Longest Match

When a given source matches multiple static Mroutes in the MRIB, the longest match will be selected. The order in which the static Mroutes were configured will not be a factor.

Example

- If the following static mroutes were configured in order:

```
ip mroute 0.0.0.0/0 Ethernet1
nip mroute 192.168.0.0/16 Ethernet2
nip mroute 192.168.1.0/24 Ethernet3
```

For an (S,G) route where S = 192.168.1.1, the third static mroute listed above would be selected since it is the most specific route to the source. The RPF interface would therefore be Ethernet 3. The table below shows the selected RPF interface for 3 different sources based on the configuration above:

<table>
<thead>
<tr>
<th>Source</th>
<th>RPF Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.1.1</td>
<td>Ethernet 3</td>
</tr>
<tr>
<td>192.168.1.2</td>
<td>Ethernet 3</td>
</tr>
<tr>
<td>192.168.2.1</td>
<td>Ethernet 2</td>
</tr>
<tr>
<td>10.0.0.1</td>
<td>Ethernet 1</td>
</tr>
</tbody>
</table>

Administrative Distance

User is allowed to specify an administrative distance with each static Mroute. While selecting a Static Mroute for a source, if multiple Static Mroute exist in the MRIB with the same source/mask, then, the one with the lowest Admin distance is selected. The default administrative distance for a Static Mroute is 1.

Interface Status

For a Static Mroute to be considered for selection, the specified interface must be UP and PIM must be enabled on it.
15.1.5.2  Selecting RPF interface

Static Mroutes are BGP IP Multicast (SAFI 2) learned routes. These routes are stored in the multicast routing information base (MRIB), a separate routing table. The RPF interface is selected for a source as follows:

Initially, a source route is looked up in the MRIB. If the MRIB lookup yields a route, that route is used for selecting the RPF interface. Therefore, any configured Static Mroutes matching the source wins the selection process over a 'Connected' route to the source. For a static mroute to be considered for selection, the specified interface must be up and PIM must be enabled on it. By default, Static Mroute have an Admin distance of 1. If multiple Static Mroutes exist with equal longest prefix match, the mroute with the lowest Admin distance will win. Admin distance is not be used to compare selection between unicast RIB and MRIB routes. Successful Static Mroute looked up in the MRIB are always chosen over unicast RIB lookups.

If MRIB lookup does not yield a route, then the unicast RIB is looked up for a route to select the RPF interface. If the selected route has ECMP, one of the corresponding paths is selected as RPF neighbor.

Note: The path to choose RPF neighbor is selected based on the hashing scheme; and protocols specified for valid paths, multi-path configuration, directly connected sources, and assert winners.

Example

- Let us assume that the Static Mroute is configured, and for this example let us consider that the default Admin distance for connected routes is 0, 1 for static routes, and 110 for OSPF routes.

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Interface</th>
<th>Admin Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.16.0.0/16</td>
<td>Ethernet 1</td>
<td>1</td>
</tr>
<tr>
<td>192.168.0.0/16</td>
<td>Ethernet 2</td>
<td>1</td>
</tr>
<tr>
<td>192.168.1.0/24</td>
<td>Ethernet 3</td>
<td>1</td>
</tr>
<tr>
<td>192.168.1.0/24</td>
<td>Ethernet 4</td>
<td>255</td>
</tr>
<tr>
<td>192.168.1.3/32</td>
<td>Ethernet 5</td>
<td>255</td>
</tr>
<tr>
<td>200.10.0.0/16</td>
<td>Ethernet 5</td>
<td>1</td>
</tr>
<tr>
<td>200.11.0.32/16</td>
<td>Ethernet 5</td>
<td>1</td>
</tr>
</tbody>
</table>

- So the MRIB table contains the following:

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Interface</th>
<th>Protocol</th>
<th>Admin Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.0.0/24</td>
<td>Ethernet 6</td>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>Prefix</td>
<td>Interface</td>
<td>Protocol</td>
<td>Admin Distance</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------</td>
<td>----------</td>
<td>----------------</td>
</tr>
<tr>
<td>172.16.1.0/24</td>
<td>Ethernet 7</td>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>192.168.0.0/16</td>
<td>Ethernet 8</td>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>192.168.1.0/24</td>
<td>Ethernet 9</td>
<td>Static</td>
<td>1</td>
</tr>
<tr>
<td>192.168.1.3/32</td>
<td>Ethernet 10</td>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>200.10.0.0/16</td>
<td>Ethernet 11</td>
<td>Connected</td>
<td>0</td>
</tr>
</tbody>
</table>

- The table below shows the RPF interface selections for a set of sources along with which Static Mroute was chosen, which unicast RIB route was chosen, which was the eventual winner, and the reasoning behind the selection.

<table>
<thead>
<tr>
<th>Source</th>
<th>Static Mroute</th>
<th>Unicast Route</th>
<th>Winner</th>
<th>RPF Interface</th>
<th>Reasoning</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.0.1</td>
<td>-</td>
<td>1</td>
<td>Unicast Route</td>
<td>Ethernet 6</td>
<td>• Only the unicast Rib yields a route to the source so it wins</td>
</tr>
<tr>
<td>200.11.0.1</td>
<td>7</td>
<td>-</td>
<td>Static Mroute</td>
<td>Ethernet 5</td>
<td>• Only the MRIB yields a route to the source so it wins</td>
</tr>
</tbody>
</table>
| 192.168.1.3     | 5             | 5             | Unicast Route | Ethernet 10   | • In the MRIB (5) is the longest match  
• While comparing the static mroute and the unicast route, the unicast route is the winner because it has a lower Admin distance                                                   |
| 192.168.2.1     | 2             | 3             | Static Mroute | Ethernet 2    | • In the MRIB (2) is the longest match  
• While comparing the static mroute and the unicast route, the static Mroute is the winner because it has a lower Admin distance                                                                   |
### 15.1.6 Configuring Multicast

This section describes the following configuration tasks:

- Enabling IPv4 Multicast Routing
- Enabling IPv6 Multicast Routing
- Multicast-Routing Configuration Example
- Multicast Boundary Configuration
- Multicast multipath router-ID (IPv4)

#### 15.1.6.1 Configuring Multicast

This section describes the following configuration tasks:

- Enabling IPv4 Multicast Routing
- Enabling IPv6 Multicast Routing
- Multicast-Routing Configuration Example
- Multicast Boundary Configuration
- Multicast multipath router-ID (IPv4)

#### 15.1.6.1.1 Enabling IPv4 Multicast Routing

Enabling IPv4 multicast routing allows the switch to forward multicast packets. The `routing` command enables multicast routing. When multicast routing is enabled, `running-config` contains a `routing` statement.

**Example**

- These commands enable IPv4 multicast routing on the switch.

```plaintext
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#routing
```

#### 15.1.6.1.2 Enabling IPv6 Multicast Routing

Enabling IPv6 Multicast routing allows the switch to distribute IPv6 datagrams to one or more recipients. IPv6 PIM builds and maintains Multicast routing using reverse path forwarding (RPF) based on unicast routing table. IPv6 PIM is protocol-independent and can use routing tables consisting of OSPFv3, IPv6 BGP or static routes, for RPF lookup. MLD is used to discover Multicast hosts.
and maintain group membership on directly attached link. This feature is supported on 7280R and 7500R. Source-specific multicast (SSM) is currently supported on L3 routed port.

**PIM Sparse Mode**

In PIM-SM, each host (sender and/or receiver) is associated with a designated router (DR) which acts for all directly connected hosts in PIM-SM transactions. Upon receiving of MLD report from host or PIM join from downstream PIM neighbor, (S,G) route is created or programmed and router sends a PIM join to upstream PIM neighbor with shortest path to the source.

**Configuring IPv6 Multicast Routing**

The following steps are to configure IPv6 multicast routing on the switch.

1. Enabling IPv6 multicast-routing. By default, multicast-routing is disabled on switch. The following commands are used to enable IPv6 multicast-routing.

   **Example:**
   ```
   switch(config)#router multicast
   switch(config-router-multicast)#ipv6
   switch(config-router-multicast-ipv6)#routing
   ```

2. Enabling IPv6 PIM Sparse Mode

   By default, IPv6 PIM is disabled on an interface. The `pim ipv6 sparse-mode` command enables an interface to participate in IPv6 multicast-routing domain.

   **Example:**
   ```
   switch(config)#interface ethernet 15/1
   switch(config-if-Et15/1)#pim ipv6 sparse-mode
   ```

   **Note:** SVI is not supported.

3. Enabling MLD

   By default, MLD is disabled on an interface. Enabling MLD is needed only on the interface that is connected to the MLD host which would like to receive IPv6 multicast traffic.

   **Example:**
   ```
   switch(config)#interface ethernet 15/1
   switch(config-if-Et15/1)#mld
   ```

**15.1.6.1.3 Multicast-Routing Configuration Example**

```
router multicast
 ipv6
   Routing
interface Ethernet15/1
   no switchport
   ipv6 enable
   ipv6 address 40:1::3/64
   mld
   pim ipv6 sparse-mode
```

**Displaying IPv6 Multicast Routing Information**

- The `show mld membership` command displays the MLD group membership table as shown.

```
switch#show mld membership
```
<table>
<thead>
<tr>
<th>Interface</th>
<th>Group</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:1</td>
<td>101:1::2</td>
</tr>
<tr>
<td>include</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:2</td>
<td>101:1::2</td>
</tr>
<tr>
<td>include</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:3</td>
<td>101:1::2</td>
</tr>
<tr>
<td>include</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:4</td>
<td>101:1::2</td>
</tr>
<tr>
<td>include</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:5</td>
<td>101:1::2</td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:8</td>
<td>101:1::2</td>
</tr>
<tr>
<td>include</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:9</td>
<td>101:1::2</td>
</tr>
<tr>
<td>include</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:a</td>
<td>101:1::2</td>
</tr>
<tr>
<td>include</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ethernet2/1.1</td>
<td>ff33::1:0:0:b</td>
<td>101:1::2</td>
</tr>
</tbody>
</table>

- The `show pim ipv6 sparse-mode route` command displays the PIM Sparse Mode Multicast Routing table as shown.

```
switch#show pim ipv6 sparse-mode route
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
       R - RPT bit is set, S - SPT bit is set, L - Source is attached
       W - Wildcard entry, X - External component interest
       I - SG Include Join alert rcvd, P - (*,G) Programmed in hardware
       H - Joining SPT due to policy, D - Joining SPT due to protocol
       Z - Entry marked for deletion, C - Learned from a DR via a register
       A - Learned via Anycast RP Router, M - Learned via MSDP
       N - May notify MSDP, K - Keepalive timer not running
       T - Switching Incoming Interface, B - Learned via Border Router
RPF route: U - From unicast routing table
          M - From multicast routing table
ff33::1:0:0:1
   101:1::2, 2:03:00, flags: S

Vlan1200(Et8/1) Vlan1223(Et2/1)
Vlan1307(Et6/1) Vlan1337(Et4/1)
```

### 15.1.6.1.4 Multicast Boundary Configuration

The multicast boundary specifies subnets where source traffic entering an interface is filtered to prevent the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The `ip multicast boundary` command configures the multicast boundary. The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.
In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Examples

- These commands configure the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.

```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
```

- These commands create a standard ACL, then implement the ACL in an ip multicast boundary command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)#ip access-list standard mbac1
switch(config-std-acl-mbac1)#10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)#20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)#30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbac1
switch(config-if-Vl200)#exit
```

15.1.6.1.5 Multicast multipath router-ID (IPv4)

The multipath deterministic command with the router-ID allows downstream PIM neighbors to direct traffic for a group or source-group to be routed through only the specified upstream PIM neighbor for all downstream PIM neighbors with the same ECMP routes. Traffic is load balanced by group or source-group across upstream PIM neighbors as in the default multipath mode.

Multipath router-ID uses the Interface Identifier (from the Hello Option for PIM) to give PIM-enabled devices a globally unique router ID for each of their PIM neighbors.

The following configures the switch to use the router_ID.

```
switch(config)# router multicast
Switch(config-router-multicast)#ipv4
Switch(config-router-multicast-ipv4)#multipath deterministic router-id
```

The following displays the switch before the configuration.

```
Switch(config-router-multicast-ipv4)#show active all
router multicast
ipv4
  counters bytes
  activity polling-interval 60
  no routing
  multipath deterministic
  max-fastdrops 1024
  unresolved cache-entries max 4000
  unresolved packet-buffers max 3
  software-forwarding kernel
```

The following displays the switch after the configuration.

```
Switch(config-router-multicast-ipv4)#show active all
```
Multicast

```text
router multicast
  ipv4
counters bytes
activity polling-interval 60
no routing
multipath deterministic router-id
max-fastdrops 1024
unresolved cache-entries max 4000
unresolved packet-buffers max 3
software-forwarding kernel
```

15.1.6.2 Configuring MFIB

MFIB formats PIM and IGMP multicast routes for protocol-independent hardware packet forwarding and adds them to the hardware multicast expansion table (MET) and the hardware FIB.

**MFIB Polling Interval**

The switch records activity levels for multicast routes in the MFIB after polling the corresponding hardware activity bits. The `activity polling-interval` command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

**Example**

- These commands set the MFIB activity polling period to 15 seconds.

  ```text
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#activity polling-interval 15
  switch(config-router-multicast-ipv4)#
  ```

**MFIB Fast Drops**

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The `no ip mfib fastdrop` command disables MFIB fast drop for the configuration mode interface.

**Example**

- This command disables MFIB fast drop for the VLAN interface 120.

  ```text
  switch(config)#interface vlan 120
  switch(config-if-Vl120)#no ip mfib fastdrop
  switch(config-if-Vl120)#
  ```

The `ip mfib max-fastdrops` command limits the number of fast-drop routes that the switchs MFIB table can contain. The default fast-drop route limit is 1024.
Example

- This command sets the maximum number of fast-drop routes to 2000.

  ```
  switch(config)#ip mfib max-fastdrops 2000
  switch(config)#
  ```

The `clear ip mfib fastdrop` command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

Example

- This command removes all fast-drop entries from the MFIB table.

  ```
  switch#clear ip mfib fastdrop
  switch#
  ```

The `show multicast fib ipv4` command displays information about the routes and interfaces in the IPv4 MFIB.

- `show multicast fib ipv4` displays MFIB information for hardware-forwarded routes.
- `show multicast fib ipv4 software` displays MFIB information for software-forwarded routes.

Example

- This command displays MFIB information for hardware-forwarded routes.

  ```
  switch#show multicast fib ipv4
  Activity poll time: 60 seconds
  239.255.255.250 172.17.26.25
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:02:11 ago
  239.255.255.250 172.17.26.156
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:02:11 ago
  239.255.255.250 172.17.26.178
  Vlan26 (iif)
  Vlan2028
  Cpu
  Activity 0:03:37 ago
  switch#
  ```

**MFIB Unresolved Cache-entries Max**

The `unresolved cache-entries max` command configures the maximum number of unresolved \((S,G)\) routes that the switch can cache packets. All packets belonging to \((S,G)\) routes exceeding the limit are dropped. The default buffer size is 4000 routes. See `ip multicast boundary` to limit the number of cached packets per \(S,G\).

Example

- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  ```
MFIB Unresolved Packet-buffers Max

The `ip multicast boundary` command specifies the number of packets per unresolved route that are queued while the route is being resolved by the switch. The limit for `ip multicast boundary` is for an individual route, packets that exceed this limit are dropped. By default, the switch processes 3 unresolved packets for an individual route. See `unresolved cache-entries max` to limit the number of unresolved routes that are cached.

Example

- This command configures the switch in the default VRF to cache up to thirty multicast packets from any route before that route is resolved.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
switch(config-router-multicast-ipv4)#
```

15.1.6.3 Displaying and Clearing the Mroute Table

The mroute table stores the states of inbound and outbound interfaces for each source/group pair (S,G). The switch discards and forwards packets on the basis of this state information. Each table entry, referred to as an mroute, corresponds to a unique (S,G) and contains:

- the multicast group address
- the multicast source address (or * for all sources)
- the inbound interface
- a list of outbound interfaces

Clearing mroute Entries

The `clear ip mroute` command removes route entries from the mroute table:

- `clear ip mroute *` all entries from the mroute table.
- `clear ip mroute gp_ipv4` all entries for the specified multicast group.
- `clear ip mroute gp_ipv4 src_ipv4` all entries for the specified source sending to a specified group.

Examples

- This command removes all route entries from the mroute table.

```
switch#clear ip mroute *
switch#
```

- This command removes entries for source 228.3.10.1 sending to multicast group 224.2.205.42.

```
switch#clear ip mroute 224.2.205.42 228.3.10.1
switch#
```

Displaying the mroute Table

The `show ip mroute count` command displays IP multicast routing table statistics.
**Example**

- This command displays IP multicast routing table statistics.

```bash
switch#show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1
switch>
```

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.

**Example**

- This command displays the IP multicast routing table for the multicast group 225.1.1.1.

```bash
switch#show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
Port-Channel1999
switch>
```
15.1.7 Multicast Commands

Multicast Configuration Commands (Global)

- activity polling-interval
- hardware counter feature multicast ipv4
- ip mfib max-fastdrops
- ip mroute
- ip multicast boundary
- ip multicast static
- mld last-listener-query-count
- mld last-listener-query-interval
- mld query-interval
- mld query-response-interval
- mld robustness
- mld snooping
- mld startup-query-count
- mld startup-query-interval
- mld static-group
- mld
- multipath deterministic
- multipath none
- route
- router multicast
- routing
- rpf route
- unresolved cache-entries max

Multicast Configuration Commands (Interface)

- ip mfib fastdrop
- ip multicast boundary

Multicast Clear Commands

- clear ip mfib fastdrop
- clear ip multicast counters
- clear ip mroute

Multicast Display Commands

- show ip mroute
- show ip mfib counters
- show ip mroute count
- show ip multicast boundary
- show mld membership
- show mld querier
- show mld snooping
- show mld statistics
- show mld summary
- show multicast fib ipv4
• show multicast fib ipv4 software
• show multicast fib ipv6
• show pim ipv6 sparse-mode route
• show platform fap mroute ipv6
15.1.7.1 activity polling-interval

The switch records activity levels for multicast routes in the mfib after polling the corresponding hardware activity bits. The activity polling-interval command specifies the frequency at which the switch polls the hardware activity bits for the multicast routes.

The no activity polling-interval and default activity polling-interval commands restore the default interval of 60 seconds by removing the activity polling-interval command from running-config.

Command Mode
Router Multicast IPv4 Configuration

Command Syntax
activity polling-interval period
no activity polling-interval
default activity polling-interval

Parameters
• period interval (seconds) between polls. Values range from 1 to 60. Default is 60.

Example
• These commands set the MFIB activity polling period to 15 seconds.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#activity polling-interval 15
switch(config-router-multicast-ipv4)#
```
15.1.7.2 clear ip mfib fastdrop

The `clear ip mfib fastdrop` command removes all fast-drop entries from the MFIB table.

**Command Mode**
Privileged EXEC

**Command Syntax**
clear ip mfib fastdrop

**Example**
• This command removes all fast-drop entries from the MFIB table.

```
switch# clear ip mfib fastdrop
switch#
```
15.1.7.3  clear ip mroute

The clear ip mroute command removes route entries from the mroute table, as follows:

- clear ip mroute * removes all entries from the mroute table.
- clear ip mroute gp_ipv4 removes all entries for the specified multicast group.
- clear ip mroute gp_ipv4src_ipv4 removes all entries for the specified source sending to the specified group.

Command Mode
Privileged EXEC

Command Syntax

```
clear ip mroute ENTRY_LIST
```

Parameters

- ENTRY_LIST entries that the command removes from the mroute table. Options include:
  - * all route entries
  - gp_ipv4 all entries for multicast group gp_ipv4 (dotted decimal notation)
  - gp_ipv4 src_ipv4 all entries for source (src_ipv4) sending to group (gp_ipv4)

Examples

- This command removes all route entries from the mroute table.

```
switch#clear ip mroute *
switch#
```

- This command removes entries for the source 228.3.10.1 sending to multicast group 224.2.205.42.

```
switch#clear ip mroute 224.2.205.42 228.3.10.1
switch#
```
15.1.7.4 clear ip multicast counters

To clear per multicast route ingress counters or clear counters for a particular multicast route, use the clear ip multicast counters command.

Command Mode
EXEC

Command Syntax

```
clear ip multicast [vrf [vrf-name]] counters group_addr source_addr
```

Parameters

- **vrf vrf-name** VRF name.
- **counters** Counter for bytes/packets.
- **group_addr** Group address.
- **source_addr** Source address.
15.1.7.5 hardware counter feature multicast ipv4

Use the `hardware counter feature multicast ipv4` command to enable per multicast router ingress packets and byte counters. The `no` and `default` forms of the command disables the feature. The feature is disabled by default.

**Command Mode**
Configuration mode

**Command Syntax**

```
hardware counter feature multicast ipv4
no hardware counter feature multicast ipv4
default hardware counter feature multicast ipv4
```

**Example**

On DCS-7020R, DCS-7280R/R2 and 7500R/R2 platforms, create and apply user defined TCAM profile with multicast counter feature db enabled. This example reates a profile copying it from the default, then modifying the profile.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#profile <profileName> copy default
switch(config-hw-tcam-profileName)#feature counter multicast ipv4
switch(config-hw-tcam-profileName-feature-counter-multicast-ipv4)#exit
switch(config-hw-tcam-profileName)#no feature mirror ip
switch(config-hw-tcam-profileName)#exit
switch(config-hw-tcam)#system profile <profileName>
```
15.1.7.6  ip mfib fastdrop

In IP multicast protocols, every (S,G) or (*,G) route is associated with an inbound RPF (reverse path forwarding) interface. Packets arriving on an interface not associated with the route may need CPU-dependent PIM processing, so packets received by non-RPF interfaces are sent to the CPU by default, causing heavy CPU processing loads.

Multicast routing protocols often do not require non-RPF packets; these packets do not require software processing. The CPU therefore updates the hardware MFIB with a fast-drop entry when it receives a non-RPF interface packet that PIM does not require. Additional packets that match the fast-drop entry are not sent to the system software.

Fast drop is enabled on all interfaces by default. The no ip mfib fastdrop command disables MFIB fast drop for the configuration mode interface.

The ip mfib fastdrop and default ip mfib fastdrop commands enable MFIB fast drop for the configuration mode interface by removing the corresponding no ip mfib fastdrop command from running-config.

The clear ip mfib fastdrop command, in global configuration mode, removes all MFIB fast-drop entries on all interfaces.

Command Mode

Interface-Ethernet Configuration
Interface-Port-channel Configuration
Interface-VLAN Configuration

Command Syntax

ip mfib fastdrop
no ip mfib fastdrop
default ip mfib fastdrop

Examples

• This command disbles MFIB fast drop for VLAN interface 120.

```
switch(config)#interface vlan 120
switch(config-if-Vl120)#no ip mfib fastdrop
switch(config-if-Vl120)#
```
15.1.7.7  ip mfib max-fastdrops

The `ip mfib max-fastdrops` command limits the number of fast-drop routes that the switch’s MFIB table can contain.

The `no ip mfib max-fastdrops` and `default ip mfib max-fastdrops` commands restore the default fast-drop route limit of 1024 by removing the `ip mfib max-fastdrops` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```plaintext
ip mfib max-fastdrops quantity
no ip mfib max-fastdrops
default ip mfib max-fastdrops
```

**Parameters**

- `quantity` maximum number of fast-drop routes. Value ranges from 0 to 1000000 (one million). Default is 1024.

**Example**

- This command sets the maximum number of fast-drop routes to 2000.

  ```plaintext
  switch(config)#ip mfib max-fastdrops 2000
  switch(config)#
  ```
15.1.7.8  ip mroute

The ip mroute command configures the Static Mroute on the switch.
The no ip mroute and default ip mroute commands remove the specified static mroute from running-config.

Command Mode
Global Configuration

Command Syntax

ip mroute [source-prefix|source-address <mask>] [rpf-interface|<rpf-neighbor>] [admin distance]

Example

• This command configures a Static IP mroute for a source 1.1.1.1/32 with an administrative distance 20 on a Ethernet interface 2/1.

  switch(config)#ip mroute 1.1.1.1/32 ethernet 2/1 20
15.1.7.9  ip multicast boundary

The **ip multicast boundary** command specifies subnets where source traffic entering the configuration mode interface is dropped, preventing the creation of mroute states on the interface. The interface is not included in the outgoing interface list (OIL). The multicast boundary can be specified through multiple IPv4 subnets or one standard IPv4 ACL.

In an ACL method, the multicast subnets are allowed only from the permit entries of the ACL and rest is either denied or filtered. Whereas, in a non-ACL method the statements configure subnets that are only denied or filtered.

Multicast PIM, IGMP and other multicast data cannot cross the boundary, facilitating the use of a multicast group address in multiple administrative domains.

The **no ip multicast boundary** and **default ip multicast boundary** commands delete the specified subnet restriction by removing the corresponding **ip multicast boundary** command from **running-config**. When these commands do not specify a subnet address, all **ip multicast boundary** statements for the configuration mode interface are removed.

**Command Mode**

Interface-Ethernet Configuration  
Interface-Port-channel Configuration  
Interface-VLAN Configuration

**Command Syntax**

```
ip multicast boundary SUBNET [TCAM]
no ip multicast boundary [SUBNET]
default ip multicast boundary [SUBNET]
```

**Parameters**

- **SUBNET** the subnet address configured as the multicast boundary. Options include:
  - `net_addr` multicast subnet address (CIDR or address mask).
  - `acl_name` standard access control list (ACL) that specifies the multicast group addresses.
- **TCAM** specifies address inclusion in the routing table. Options include:
  - `<no parameter>` boundaries ((S,G) entries) are added to routing table.
  - `out` boundaries are not added to routing table.

**Guidelines**

When `out` is selected, the first inbound data packet corresponding to the **SUBNET** may be sent to the CPU. In response, the packet is dropped and the boundary prefix is added to the hardware table. In this scenario, the mroute entry is added only when data traffic is received.

**Restrictions**

Only one command that specifies an ACL can be assigned to an interface. Commands that specify an ACL and a subnet cannot be simultaneously assigned to an interface.

**Examples**

- This command configures the multicast address of 229.43.23.0/24 as a multicast boundary where source traffic is restricted from VLAN interface 300.

```
switch(config)#interface vlan 300
switch(config-if-vl300)#ip multicast boundary 229.43.23.0/24
switch(config-if-vl300)#
```
These commands create a standard ACL, then implement the ACL in an ip multicast boundary command to allow multicast for subnet (224.0.0.0/4) and create a multicast boundary for all remaining subnets by denying them.

```
switch(config)#ip access-list standard mbac1
switch(config-std-acl-mbac1)#10 deny 225.123.0.0/16
switch(config-std-acl-mbac1)#20 deny 239.120.10.0/24
switch(config-std-acl-mbac1)#30 permit 224.0.0.0/4
switch(config-std-acl-mbac1)#exit
switch(config)#interface vlan 200
switch(config-if-Vl200)#ip multicast boundary mbac1
switch(config-if-Vl200)#exit
switch(config)#
```
15.1.7.10  ip multicast static

The `ip multicast static` command enables static multicast routing on the switch.

The `exit` command returns the switch to global configuration mode.

Command Mode

Interface Ethernet Configuration

Command Syntax

ip multicast static

Example

- The following commands configure the static multicast routing on the switch.

```bash
switch(config)#interface ethernet 1/2
switch(config-if-Et1/2)#no switchport
switch(config-if-Et1/2)#ip address 1.1.1.1/24
switch(config-if-Et1/2)#ip multicast static
```
15.1.7.11  mld last-listener-query-count

The `mld last-listener-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `mld last-listener-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

The `no mld last-listener-query-count` and `default mld last-listener-query-count` commands reset the last-listener-query-count to the default value by removing the corresponding `mld last-listener-query-count` command from the `running-config`. Default value is 2.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**

```
mld last-listener-query-count number
no mld last-listener-query-count
default mld last-listener-query-count
```

**Parameters**

- `number` the last listener query count. Values range from 0 to 100. Default value is 2.

**Example**

- This command configures the last listener query count to 3 on an Ethernet interface 1.

```
switch(config)#interface Ethernet 1
switch(config-if-Et1)#mld last-listener-query-count 3
```
15.1.7.12  mld last-listener-query-interval

The `mld last-listener-query-interval` command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group, it sends query messages at intervals set by this command. The `mld last-listener-query-count` specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The `no mld last-listener-query-interval` and `default mld last-listener-query-interval` commands reset the last-listener-query-interval to the default value by removing the corresponding `mld last-listener-query-interval` command from the `running-config`. Default value is one second.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**

```
mld last-listener-query-interval period
no mld last-listener-query-interval
default mld last-listener-query-interval
```

**Parameters**

- `period` the last listener query interval in seconds. Values range from 1 to 3175.

**Example**

- This command configures the last listener query interval to 2 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld last-listener-query-interval 2
```
15.1.7.13  mld query-interval

The mld query-interval command configures the frequency at which the configuration mode interface, as an MLD querier, sends host-query messages.

An MLD querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The no mld query-interval and default mld query-interval commands reset the query interval to the default value by removing the corresponding mld query-interval command from the running-config.

Command Mode
Interface-Ethernet Configuration

Command Syntax
mld query-interval period
no mld query-interval
default mld query-interval

Parameters
• period the interval between query messages in seconds. Values range from 1 to 3175.

Example
• This command configures the query interval of 30 seconds on an Ethernet interface 1.

switch(config)#interface Ethernet1
switch(config-if-Et1)#mld query-interval 30
15.1.7.14  mld query-response-interval

The mld query-response-interval command configures the maximum response time that the recipient can wait before responding with a membership report on receipt of a general query.

The no mld query-response-interval and default mld query-response-interval commands reset the query interval to the default value by removing the corresponding mld query-response-interval command from the running-config.

Command Mode
Interface-Ethernet Configuration

Command Syntax
mld query-interval period
no mld query-interval
default mld query-interval

Parameters
• period the query response interval in seconds. Values range from 1 to 3175.

Example
• This command configures the query response interval of 30 seconds on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld query-response-interval 30
```
15.1.7.15  mld robustness

The mld robustness command configures the number of general queries to be sent before the router assumes there are no more listeners.

The no mld robustness and default mld robustness commands reset the robustness to the default value by removing the corresponding mld robustness command from the running-config.

Command Mode

Interface-Ethernet Configuration

Command Syntax

mld robustness robust_value

no mld robustness

default mld robustness

Parameters

• robust_value the robustness count. Values range from 1 to 100.

Example

• This command configures the robustness value to 2 on an Ethernet interface 1.

  switch(config)#interface Ethernet1
  switch(config-if-Et1)#mld robustness 2
Multicast Listener Discovery (MLD) snooping constrains the flooding of IPv6 multicast traffic on VLANs and IGMP snooping for IPv4 environments. When MLD snooping is enabled on a VLAN, the device examines MLD messages between the hosts and multicast routers and learns which hosts are interested in receiving traffic for a multicast group. You can use the `mld snooping` command to configure MLDv2 snooping globally and per VLAN.

The `no` and the `default` forms of the command removes the mld snooping configuration.

**Command Mode**

Global configuration mode

**Command Syntax**

```
mld snooping
no mld snooping
default mld snooping
```

**Example**

The following example configures MLDv2 snooping globally and per VLAN.

```
switch(config)#mld snooping
switch(config-mld-snooping)#disabled
switch(config-mld-snooping)#vlan 1-100
switch(config-mld-snooping)#vlan 101
switch(config-mld-snooping-vlan-101)#disabled
```
15.1.7.17  mld startup-query-count

The `mld startup-query-count` command specifies the number of query messages that an interface sends during the startup query interval.

When an interface starts running MLD, it can establish the group state more quickly by sending query messages at a higher frequency. The `mld startup-query-interval` and `mld startup-query-count` commands define the startup period and the query message transmission frequency during that period.

The `no mld startup-query-count` and `default mld startup-query-count` commands restore the default startup-query-count value by removing the corresponding `mld startup-query-count` command from the `running-config`.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**
```
mld startup-query-count number
no mld startup-query-count
default mld startup-query-count
```

**Parameters**

- `number` the startup query count. Values range from 1 to 100.

**Example**

- This command configures the startup query count of 4 on an Ethernet interface 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld startup-query-count 4
```
15.1.7.18  mld startup-query-interval

The mld startup-query-interval command specifies the interval between the general queries sent by a querier on startup.

When an interface starts running MLD, it can establish the group state quicker by sending query messages at a higher frequency. The mld startup-query-interval and mld startup-query-count commands define the startup period and the query message transmission frequency during that period.

The no mld startup-query-count and default mld startup-query-interval commands restore the default startup-query-interval value by removing the corresponding mld startup-query-interval command from the running-config.

Command Mode
Interface-Ethernet Configuration

Command Syntax
mld startup-query-interval period
no mld startup-query-interval
default mld startup-query-interval

Parameters
• period the startup query interval in seconds. Values range from 1 to 3175.

Example
• This command configures the startup query interval of 100 seconds on an Ethernet interface 1.

switch(config)#interface Ethernet1
switch(config-if-Et1)#mld startup-query-interval 100
15.1.7.19  mld static-group

The **mld static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast traffic of the specified group is fast-switched.

The **no mld static-group** and **default mld static-group** commands remove the configuration mode interfaces group membership by removing the corresponding **mld startup-group** command from the *running-config*.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mld static-group source_address [group_address | access-list acl_name]
no mld static-group source_address [group_address | access-list acl_name]
default mld static-group source_address [group_address | access-list acl_name]
```

**Parameters**

- **source_address** IP address of the host that originates multicast data packets.
- **group_address** IPv6 address of a multicast group.
- **access-list** IPv6 access list to use as a static group list.
- **acl_name** specifies access-list name

**Examples**

- This command configures static groups on an interface Ethernet 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld static-group ff30::1 a::1
```

- This command configures multiple static groups using an access list on an interface Ethernet 1.

```
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld static-group access-list testAccessList
```
15.1.7.20 mld

The mld command enables multicast listener discovery on an interface which controls the flow of layer 3 IPv6 multicast traffic. Hosts request and maintain multicast group membership through MLD messages. Multicast routers use MLD to maintain a membership list of active multicast groups for each attached network.

The no mld and default mld commands restore the default behavior by removing the corresponding mld command from the running-config.

Note: It is possible to change the values of the querier parameters used by MLD.

Command Mode
Interface-Ethernet Configuration

Command Syntax
mld [last-listener-query-count | last-listener-query-interval | query-interval | query-response-interval | robustness | startup-query-count | startup-query-interval | static-group]

no mld
default mld

Parameters
• last-listener-query-count the number of group-specific or group-source-specific queries to send before the router assumes there are no more listeners.
• last-listener-query-interval the interval between the last listener queries.
• query-interval the interval between the general queries regularly sent by a querier.
• query-response-interval the interval that the host has to respond to a general query.
• robustness the number of general queries to send before the router assumes there are no more listeners.
• startup-query-count the number of queries a router sends at startup.
• startup-query-interval the interval between the general queries sent by a querier at startup.
• static-group the number of static groups or sources of MLD messages.

Examples
• This command enables MLD on the Ethernet interface 1.

```bash
switch(config)#interface Ethernet1
switch(config-if-Et1)#mld
```
15.1.7.21 multipath deterministic

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The `no multipath deterministic` command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The `multipath deterministic` and `default multipath deterministic` commands restore the default behavior of randomly distributing multicast traffic over all ECMP links.

**Command Mode**
Router Multicast IPv4 Configuration

**Command Syntax**

```
multipath deterministic
no multipath deterministic
default multipath deterministic
```

**Related Commands**

- `multipath none` performs the same function as `no multipath deterministic`

**Example**

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#no multipath deterministic
  switch(config-router-multicast-ipv4)#
  ```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#multipath deterministic
  switch(config-router-multicast-ipv4)#
  ```

- These commands configure the switch to load balance multicast traffic by enabling the behavior of RPF selection.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#multipath deterministic router-id
  switch(config-router-multicast-ipv4)#
  ```
Multicast

15.1.7.22  **multicast none**

By default, multicast traffic is load balanced by distributing packets over all ECMP links. The **multicast none** command routes multicast ECMP traffic to the neighbor with the highest IPv4 address.

The **no multicast none** and **default multicast none** commands restore the default behavior of randomly distributing multicast traffic over all ECMP links by removing the **multicast none** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `multipath none`
- `no multipath none`
- `default multipath none`

**Related Commands**

- **multipath deterministic** performs the same function as **no multipath none**

**Example**

- These commands configure the switch to route multicast traffic through the ECMP link to the neighbor with the highest IP address.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#multipath none
  ```

- These commands configure the switch to load balance multicast traffic by distributing packets over all ECMP links.

  ```
  switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#no multipath none
  ```
route

The `route` command configures a static multicast route for the specified source, destination group, and incoming interface on the router.

The `no route` and `default route` commands remove the specified static multicast route by removing the corresponding `route` command from `running-config`.

Command Mode

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

Command Syntax

```
route group_address [source_address] iif interface [oif interface] [cpu] [iifFrr interface]
[priority priority_num]
```

```
no route group_address
```

```
default route group_address
```

Parameters

- `group_address` the multicast group address
- `source_address` the optional source address for the multicast route
- `iif interface` specifies an incoming interface for the static route
- `cpu` optionally mirrors multicast packets to the CPU
- `oif interface` specifies an optional outgoing interface to be included among those on which the multicast traffic is forwarded
- `iifFrr interface` specifies an optional interface for multicast-only fast reroute
- `interface` options include:
  - Ethernet `ethernet_port` Ethernet interface
  - Null0 drops all traffic
  - Port-Channel `lag_no` port-channel interface or sub-interface; values range from 1-2000 or 1-2000.1-4094
  - Register0 drops all incoming traffic
  - Vlan `vlan_no` VLAN interface
- `priority priority_num` specifies an optional priority for the multicast route. If the same route is present in several multicast routing tables, the priority number is used to select the best available route. Values range from 0 to 255; PIM routes by default have a priority of 0, while static multicast routes by default have a priority of 255.

Examples

- These commands create a static multicast route in the default VRF. The static route has a group address of 225.3.3.3 and source address of 1.1.1.1. It uses VLAN 100 as its incoming interface, VLANs 200 and 300 as its outgoing interfaces, and Ethernet interface 2 as its multicast-only fast reroute interface.

```text
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#route 225.3.3.3 1.1.1.1 iif Vlan100 oif Vlan200 Vlan300 iifFrr Ethernet2
switch(config-router-multicast-ipv4)#
```
15.1.7.24  router multicast

The `router multicast` command places the switch in router-multicast configuration mode to configure IPv4 and IPv6 router multicast traffic.

**Command Mode**
Global Configuration

**Command Syntax**
`router multicast`

**Example**
- The following command places the switch in router-multicast configuration mode.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv6
switch(config-router-multicast-ipv6)#routing
```
15.1.7.25 routing

The `routing` command allows the switch to forward multicast packets. Multicast routing is disabled by default.

The `no routing` and `default routing` commands disable multicast routing by removing the `routing` command from `running-config`.

**Command Mode**

Router Multicast IPv4 Configuration
Router Multicast VRF IPv4 Configuration

**Command Syntax**

```
routing
no routing
default routing
```

**Example**

- These commands enable multicast routing on the switch.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#routing
switch(config-router-multicast-ipv4)#
```
15.1.7.26  rpf route

The **rpf route** command specifies a candidate for the multicast reverse path forwarding (RPF) interface of any (S,G) multicast route (mroute), where the source falls within the given network prefix. Static mroutes are stored in a separate routing table, the multicast routing information base (MRIB).

**Command Mode**
Router Multicast IPv4 Configuration

**Command Syntax**
```
rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>} [admin_distance]
```
```
no rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>}
```
```
default rpf route {<source_prefix>|<source_address> <mask>} {<rpf_interface>|<rpf_neighbor>}
```

**Parameters**
- **source_prefix** specifies the source prefix.
- **source_address** specifies the source address.
- **mask** specifies the address mask.
- **rpf_interface** specifies the multicast RPF interface.
- **rpf_neighbor** specifies the multicast RPF neighbor.
- **admin_distance** specifies the administrative distance (optional). Values range from 1 to 255.

**Examples**
- These commands select the longest match when a source matches multiple static mroutes in the MRIB.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)##
```

- These commands include an administrative distance of 255 on Ethernet interface 5 with static mroute.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#rpf route 10.0.0.0/16 Ethernet 4
switch(config-router-multicast-ipv4)#rpf route 11.10.1.0/24 Ethernet 5
     255
switch(config-router-multicast-ipv4)#rpf route 11.10.1.2/32 Ethernet 6
switch(config-router-multicast-ipv4)#
```
15.1.7.27  show ip mfib counters

Use the `show ip mfib counters` command to display per multicast route ingress packet and byte counters.

**Command Mode**

EXEC

**Command Syntax**

```
show ip mfib vrf [vrf-name] group_addr source_addr counters
```

**Parameters**

- `vrf [vrf-name]` VRF name.
- `group_addr` Group address.
- `source_addr` Source address.
- `counters` Counter for bytes/packets.

**Example**

```
switch#show ip mfib 225.1.2.1 10.46.1.2 counters
Activity poll time: 60 seconds
  225.1.2.1 10.46.1.2
    Byte: 1200200
    Packet: 12002
    Ethernet46 (iif)
    Ethernet47
      Activity 0:02:52 ago
switch#
```
15.1.7.28  show ip mroute count

The show ip mroute count command displays IP multicast routing table statistics. The show ip mroute command displays information from the IP multicast routing table.

Command Mode
EXEC

Command Syntax
show ip mroute count

Example
- This command displays IP multicast routing table statistics.

```
switch#show ip mroute count
IP Multicast Statistics
1 groups and 1 sources
Multicast routes: 1 (*,G), 1 (S,G)
Average of 1.00 sources per group
Maximum of 1 sources per group:
228.24.12.1
switch#
```
15.1.7.29  **show ip mroute**

The `show ip mroute` command displays information from the IP multicast routing table.

- `show ip mroute` displays information for all routes in the table.
- `show ip mroute gp_addr` displays information for the specified multicast group.

**Command Mode**

EXEC

**Command Syntax**

```
show ip mroute
show ip mroute gp_addr
```

**Parameters**

- `gp_addr` group IP address (dotted decimal notation).

**Example**

- This command displays the IP multicast routing table entry for the multicast group 225.1.1.11

```
switch#show ip mroute 225.1.1.1
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
R - RPT bit is set, S - SPT bit is set
W - Wildcard entry, X - External component interest
I - SG Include Join alert rcvd, P - Ex-Prune alert rcvd
H - Joining SPT due to policy, D - Joining SPT due to protocol
Z - Entry marked for deletion
A - Learned via Anycast RP Router
225.1.1.1
172.28.1.100, 5d04h, flags: S
Incoming interface: Vlan281
Outgoing interface list:
Port-Channel1999
switch#
```
15.1.7.30  show ip multicast boundary

The `show ip multicast boundary` command displays the summary of all IP multicast boundaries across all interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show ip multicast boundary [group_prefix | group_prefix/length [out] | interface [ethernet e_num | loopback l_num | management m_num | port-channel p_num | vlan v_num] | out]
```

**Parameters**

- `<no parameters>` displays the summary of all IP multicast boundaries across all interfaces
- `group_prefix` displays the list of IP multicast boundaries matching the specified group address with subnet mask.
- `group_prefix/length` displays the list of IP multicast boundaries matching the specified group address with CIDR notation. Option includes:
  - `out` displays the specified group addresss IP multicast boundaries whose control plane filtering is enabled
- `interface` displays IP multicast boundary of the specified interface. Options include:
  - `ethernet e_num` displays IP multicast boundaries of the specified Ethernet interface
  - `loopback l_num` displays IP multicast boundaries of the specified Loopback interface
  - `management m_num` displays IP multicast boundaries of the specified management interface
  - `port-channel p_num` displays IP multicast boundaries of the specified port channel interface
  - `vlan v_num` displays IP multicast boundaries of the specified VLAN interface
  - `out` displays all IP multicast boundaries whose only control plane filtering is enabled

**Examples**

- This command displays the summary of all IP multicast boundaries across all interfaces.

  ```
  switch(config-if-Et24)#show ip multicast boundary
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24 Yes
  Ethernet1 224.6.6.0/24 Yes
  Ethernet2 224.4.4.0/24 Yes
  Ethernet3 224.5.5.0/24 No
  ```

- This command displays all IP multicast boundaries matching 224.5.5.0 255.255.255.255.

  ```
  switch(config-if-Et24)#show ip multicast boundary 224.5.5.0 255.255.255.255
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/255.255.255.255 No
  ```

- This command displays all IP multicast boundaries matching 224.5.5.0/24.

  ```
  switch(config-if-Et24)#show ip multicast boundary 224.5.5.0/24
  Interface Denied Prefix Data Plane Filtered
  Ethernet1 224.5.5.0/24
  Ethernet3 224.5.5.0/24 No
  ```

- This command displays all IP multicast boundaries of the Ethernet1 interface.

  ```
  switch(config-if-Et24)#show ip multicast boundary interface Ethernet1
  ```
• This command displays the list of IP multicast boundaries whose only control plane filtering is enabled.

```
switch(config-if-Et24)#show ip multicast boundary out
Interface Denied Prefix Data Plane Filtered
Ethernet1 224.5.5.0/24 No
Ethernet3 224.5.5.0/24 No
```
15.1.7.31  show mld membership

The show mld membership command displays MLD group and source membership information on a specific interface.

**Command Mode**

EXEC

**Command Syntax**

```
show mld membership [dynamic | group | interface | static]
```

**Parameters**

- **dynamic** displays MLD information for a dynamic group.
- **group** displays MLD information for a specified multicast group address.
- **interface** displays MLD information for the specified interface.
- **static** displays MLD information for statically configured group.

**Example**

- This command displays MLD group and source information on the Ethernet interface 3 and 6.

```
switch#show mld membership
Interface                  Group       Source
 Ethernet3                ff30::1     a::2
   include                include
 Ethernet3                ff30::1     a::1
   include                include
 Ethernet6                ff30::2     a::2
   include                include
```
show mld querier

The `show mld querier` command displays information about the MLD querier and querier parameters.

**Command Mode**

EXEC

**Command Syntax**

`show mld querier [interface | parameters]`

**Parameters**

- `interface` displays MLD querier information.
- `parameters` displays MLD querier parameters.

**Example**

- This command displays MLD querier on the Ethernet interface Et3 and Et6.

  ```
  Switch#show mld querier
  Interface    Querier                                  General    Other
               Version                                  Query      Expiry     Expiry
  Querier
  ---------    -------                                  ----------  -------
  ---------  -------                                  --------
  Et3          fe80::1:ff:fe01:0                        0:01:14    N/A
  2
  Et6          fe80::1:ff:fe01:0                        0:01:14    N/A
  2
  ```

- This command displays MLD querier parameters on the Ethernet interface Et3 and Et6.

  ```
  Switch#show mld querier parameters
  Interface   Robustness Query      Query      Startup      Startup
             Last       Last       Interval   Response   Query      Query
             Listener   Listener   Interval   Interval   Count
  Query      Query

  Et3           2          125        10         31.25      2          1
  2
  Et6           2          125        10         31.25      2          1
  2
  ```
### 15.1.7.33 show mld snooping

Use the `show mld snooping` command to display the snooping status of the switch.

**Command Mode**
EXEC

**Command Syntax**
```
```

**Parameters**
- **counters** MLD counter information.
  - **errors** Error counters.
- **groups** MLD group information.
  - **A:B:C:D:E:F:G:H** IPv6 address.
  - **count** Displays membership count.
  - **detail** Displays a comprehensive output.
  - **local** Displays groups learned locally via MLD.
  - **mlag** Displays groups learned via MLAG peer.
  - **user** Displays groups configured by the user.
  - **vlan** Specifies VLAN.
- **mrouter** MLD multicast router information.
  - **detail** Displays a comprehensive output.
  - **vlan** Specifies VLAN.
- **querier** MLD querier information.
  - **vlan** Specifies VLAN.
  - **num** <1-4094> Identifier for Virtual LAN.

**Examples**
- Use the `show mld snooping` command to display the MLD snooping status of the switch.

```
switch#show mld snooping
Global MLD Snooping configuration:
-------------------------------------------
MLD snooping                   : Enabled
Robustness variable            : 2

VLAN 1 :
---------
MLD snooping                   : Disabled
MLD max group limit            : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active    : False
Flooding traffic to VLAN       : True

VLAN 100 :
---------
MLD snooping                   : Enabled
MLD max group limit            : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active    : True
Flooding traffic to VLAN       : False
```
switch#show mld snooping vlan 100
Global MLD Snooping configuration:
-------------------------------------------
MLD snooping                   : Enabled
Robustness variable            : 2
VLAN 100 :
--------
MLD snooping                   : Enabled
MLD max group limit            : No limit set
Recent attempt to exceed limit : No
MLD snooping pruning active    : True
Flooding traffic to VLAN       : False

- Use the show mld snooping groups command to display VLANs by group.

switch#show mld snooping groups
IGMP Snooping Group Membership
EX : Filter mode Exclude
IN : Filter mode Include
IR : Ingress Replication
VLAN  Group            Members
----  ---------------  ----------------------------------------

100   ff08::11         *                -     0d00h13m17   Et1
100   ff08::21         1::1             IN    0d00h13m20   Et2
100   ff08::31         2::1             EX    0d00h01m31   Et3
100   *                *                -     -            Et3, Et4

- The show mld snooping groups command output can be further filtered to output just the:
  - local groups, That is groups learned locally using show mld snooping groups local command.
  - user groups, that is groups configured by user using the show mld snooping groups user command.
  - mlag groups, that is groups learned from the MLAG peer using the show mld snooping groups mlag command.

- Use the show mld snooping mrouter to display MLD multicast router information.

switch#show mld snooping mrouter

The Switch interface in the above output can be ignored.
show mld statistics

The `show mld statistics` command displays total statistics information of incoming and outgoing MLD messages on a specific interface.

**Command Mode**

EXEC

**Command Syntax**

`show mld statistics version value`

**Parameters**

- `version` specifies MLD version.
- `value` specifies the MLD version number. Accepted version values are 1 and 2.

**Example**

- This command displays total MLD statistics on the Ethernet interface Et3 and Et6.

```
switch#show mld statistics
MLD Total (Version1 + Version2) Statistics

<table>
<thead>
<tr>
<th>Sent</th>
<th>Received</th>
<th>Queries</th>
<th>Reports</th>
<th>Dones</th>
<th>Others</th>
<th>Errors</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et3</td>
<td></td>
<td>0</td>
<td>12</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>12</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Et6</td>
<td></td>
<td>0</td>
<td>11</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>12</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
15.1.7.35  **show mld summary**

The **show mld summary** command displays MLD summary information.

**Command Mode**
EXEC

**Command Syntax**

```
show mld summary
```

**Parameters**

- `interface` displays MLD summary on a specified interface.

**Example**

- This command displays MLD summary on the Ethernet interface 3 and 6.

```
Arista#show mld summary

Interface    IPv6 link-local address    Group Count Querier State
---------    ---------------------    -----------     -------------
          fe80::1:ff:fe01:0    2  querier
Ethernet3
          fe80::1:ff:fe01:0    2  querier
Ethernet6

Number of MLD interfaces: 2
Number of total groups joined across all MLD interfaces: 4
```
15.1.7.36   show multicast fib ipv4 software

The `show multicast fib ipv4 software` command displays information about the interfaces and the software-forwarded routes included in the IPv4 multicast forwarding information base (MFIB). Use the `show multicast fib ipv4` command for hardware-forwarded routes.

Parameter options are available to filter output by group address or group and source address.

**Command Mode**

EXEC

**Command Syntax**

`show multicast fib ipv4 software [INFO_LEVEL] [ROUTE]`

**Parameters**

- **INFO_LEVEL** specifies the type of information displayed. Options include
  - `<no parameter>` displays packet reception counters.
  - `detail` displays packet reception counters and packet queued/dropped counters.
- **ROUTE routes displayed, filtered by multicast group and source IP addresses:**
  - `<no parameter>` shows information for all software-forwarded routes in the MFIB.
  - `group_addr` shows information only for the specified multicast group.
  - `group_addr source address` shows information only for the specified group and source.

**Example**

- This command displays MFIB information for all software-forwarded routes in the MFIB.

```
switch# show multicast fib ipv4 software
239.255.255.250 172.17.41.150
    Vlan3040 (iif)
    Packets Received: 18
    Bytes Received : 9147
    RPF Failures    : 0
239.255.255.250 172.17.41.120
    Vlan3040 (iif)
    Packets Received: 6
    Bytes Received : 966
    RPF Failures    : 0
switch#
```

- This command displays detailed MFIB information for all software-forwarded routes in the MFIB.

```
switch# show multicast fib ipv4 software detail
239.255.255.250 172.17.41.150
    Vlan3040 (iif)
    Packets Received: 18
    Bytes Received: 9147
    RPF Failures: 0
    Packets Queued/Dropped : 0 / 0
239.255.255.250 172.17.41.120
    Vlan3040 (iif)
    Packets Received: 6
    Bytes Received: 966
    RPF Failures: 0
    Packets Queued/Dropped : 0 / 0
switch#
```
15.1.7.37  show multicast fib ipv4

The `show multicast fib ipv4` command displays information about interfaces and the hardware-forwarded routes included in the IPv4 Multicast Forwarding Information Base (MFIB).

**Command Mode**
EXEC

**Command Syntax**
```
show multicast fib ipv4 [group_address [source_address] | bidirectional | count | counter | df | rpa | software | sparse-mode | static | summary | vrf]
```

**Parameters**
- `<no parameters>` displays information for all hardware-forwarded routes in the MFIB
- `group_address` displays the information of the specified multicast group address. Options include:
  - `source_address` displays the information of the specified multicast group and source addresses
  - `count` displays the multicast routes count of the specified group address
  - `counters` displays the multicast route traffic count of the specified group address
- `bidirectional` displays the information of bidirectional routes
- `count` displays the count of multicast routes
- `counter` displays the count of multicast route traffic in either bytes or packets
- `df` displays the bidirectional Protocol Independent Multicast (PIM) Designated Forwarder (DF) bitmap
- `rpa` displays the bidirectional PIM Rendezvous Point Address (RPA) index
- `software` displays the software multicast FIB
- `sparse-mode` displays the sparse-mode information
- `static` displays the static multicast information
- `summary` displays the multicast FIB summary
- `vrf vrf_name` displays information of the corresponding VRF

**Guidelines**
The counter is not available (N/A) if a multicast route does not have an associated counter. If the counter value for any source in a group address is N/A, then the sum of counters for the group address is N/A. However, the counter values for other sources are still displayed.

**Examples**
- This command displays the bidirectional PIM RPA index.
  
  ```
  switch#show multicast fib ipv4 rpa
  Prefix                         Rpa Index
  225.0.0.0/8                    1
  226.0.0.0/8                    1
  ```

- This command displays the static multicast route information.
  ```
  switch#show multicast fib ipv4 static count
  (S,G) routes: 34
  (*,G) routes: 31
  Fastdrop routes:  0
  Prefix routes: 12
  ```

- This command displays the multicast routes count of the specified group and source addresses.
  ```
  switch#show multicast fib ipv4 229.0.0.0 10.1.5.101 count
  Activity poll time: 60 seconds
  ```
This command displays the multicast route traffic count of the specified group and source addresses.

```
switch#show multicast fib ipv4 229.0.0.0 10.1.5.101 counters
   Activity poll time: 60 seconds
   229.0.0.0 10.1.5.101
       Byte: 46128
       Packet: 93
       Port-Channel100 (iif)
       Activity 0:53:52 ago
```

This command displays the multicast FIB summary.

```
switch#show multicast fib ipv4 summary
   Number of multicast routes: 12
   Number of fastdrop routes : 45
```
15.1.7.38  show multicast fib ipv6

The `show multicast fib ipv6` command displays the Multicast Forwarding Information Base (MFIB) table.

**Command Mode**

EXEC

**Command Syntax**

`show multicast fib ipv6`

**Example**

- The command output displays the Multicast Forwarding Information Base (MFIB) table as shown.

```plaintext
switch#show multicast fib ipv6
Activity poll time: 60 seconds
 ff33::1:0:0:1 101:1::2
 Ethernet11/1 (iif)
 Ethernet9/1.1
 Ethernet2/1.1
 Ethernet3/1.1
 Ethernet6/1.1
 Ethernet5/1.1
 Ethernet8/1.1
 Ethernet7/1.1
 Ethernet4/1.1
Activity 0:00:35 ago
```
15.1.7.39  show pim ipv6 sparse-mode route

The `show pim ipv6 sparse-mode route` command displays the PIM Sparse Mode Multicast Routing table.

**Command Mode**

EXEC

**Command Syntax**

`show pim ipv6 sparse-mode route`

**Example**

- The command output displays the PIM Sparse Mode Multicast Routing table as shown.

```plaintext
switch# show pim ipv6 sparse-mode route
PIM Sparse Mode Multicast Routing Table
Flags: E - Entry forwarding on the RPT, J - Joining to the SPT
    R - RPT bit is set, S - SPT bit is set, L - Source is attached
    W - Wildcard entry, X - External component interest
    I - SG Include Join alert rcvd, P - (*.G) Programmed in hardware
    H - Joining SPT due to policy, D - Joining SPT due to protocol
    Z - Entry marked for deletion, C - Learned from a DR via a register
    A - Learned via Anycast RP Router, M - Learned via MSDP
    N - May notify MSDP, K - Keepalive timer not running
    T - Switching Incoming Interface, B - Learned via Border Router
    RPF route: U - From unicast routing table
    M - From multicast routing table

ff33::1:0:0:1
101:1::2, 2:03:00, flags: S
Incoming interface: Ethernet11/1
RPF route: [U] 101:1::/64 [110/1] via fe80::464c:a8ff:feb7:39e9

  Ethernet6/1.1
  Ethernet4/1.1
  Ethernet7/1.1
  Ethernet9/1.1
  Ethernet8/1.1
  Ethernet2/1.1
  Ethernet5/1.1
  Ethernet3/1.1

2732
**15.1.7.40 show platform fap mroute ipv6**

The `show platform fap mroute ipv6` command displays the Platform Hardware Forwarding table.

**Command Mode**

EXEC

**Command Syntax**

`show platform fap mroute ipv6`

**Example**

- The command output displays the Platform Hardware Forwarding table as shown

```
switch# show platform fap mroute ipv6
Jericho0 Multicast Routes:
----------------------------------------
Location     GroupId     Group
Source       McId        OIF
IIF           FLP/TT     TT
         FLP
FLP           FLP
----------------------------------------
        4096/2048      1/1      ff33::1:0:0:0:23/128
      101:1::2/128
Vlan1357 21504   Vlan1044(Et7/1) Vlan1123(Et9/1)

Vlan1200(Et8/1) Vlan1223(Et2/1)

Vlan1226(Et5/1) Vlan1232(Et3/1)
```
15.1.7.41 unresolved cache-entries max

The **unresolved cache-entries max** command configures the maximum number of unresolved (S,G) routes that the switch can cache packets. The default buffer size is 4000 (S,G) routes.

The **no unresolved cache-entries max** and **default unresolved cache-entries max** commands restore the default unresolved cache-entries buffer size of 4000 (S,G) routes by removing the **unresolved cache-entries max** command from **running-config**. See **ip multicast boundary** to limit the number of cached packets per S,G.

**Command Mode**

Router Multicast IPv4 Configuration

Router Multicast VRF IPv4 Configuration

**Command Syntax**

```plaintext
unresolved cache-entries max quantity_entries
no unresolved cache-entries max
default unresolved cache-entries max
```

**Parameters**

- **quantity_entries** maximum buffer size (routes). Value ranges from 10 to 10000000. Default is 4000.

**Example**

- This command sets the maximum MFIB unresolved cache-entry buffer size to 6000 routes in the default VRF.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved cache-entries max 6000
switch(config-router-multicast-ipv4)#
```
15.1.7.42 unresolved packet-buffers max

The `unresolved packet-buffers max` command specifies the number of (S,G) multicast packets for an individual route that the switch can process before the (S,G) entry is entered into cache. Packets that are received in excess of this limit before the route is programmed into the cache are dropped. By default, the switch processes 3 unresolved packets for an individual route.

The `no unresolved packet-buffers max` and `default unresolved packet-buffers max` commands restore the number of unresolved packets that the switch processes to the default value of 3 packets by removing the `unresolved packet-buffers max` command from `running-config`. See `unresolved cache-entries max` to limit the number of unresolved routes that are cached.

Command Mode

Router Multicast IPv4 Configuration
Router Multicast VRF IPv4 Configuration

Command Syntax

`unresolved packet-buffers max quantity_packets`

`no unresolved packet-buffers max`

`default unresolved packet-buffers max`

Parameters

- `quantity_packets` packets per unresolved route that the switch processes. Values range from 3 to 10000000. Default is 3.

Example

- This command programs the switch in the default VRF to process thirty multicast packets from any route regardless of its entry's presence in the multicast routing cache.

```
switch(config)#router multicast
switch(config-router-multicast)#ipv4
switch(config-router-multicast-ipv4)#unresolved packet-buffers max 30
```

15.2 IGMP and IGMP Snooping

- IGMP Snooping
- IGMP Host Proxy Description
- Supported Features
- IGMP Protocols
- Configuring IGMP
- Configuring IGMP Snooping
- IGMP Host Proxy
- IGMP and IGMP Snooping Commands

15.2.1 IGMP Snooping

IGMP snooping is a layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.
When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mroutes). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient's port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient's port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router's port to the port list for all multicast groups.

**Snooping Querier**

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

**L2 Report Flooding**

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

**IGMP Snooping Proxy**

IGMP snooping proxy is an enhancement over IGMP snooping. When snooping proxy is enabled, the switch starts sending proxy queries periodically to the downstream hosts and collects the IGMP reports and updates the local state. Later, when the switch receives an IGMP query from an upstream router, the switch immediately responds with a report based on its local state.

When IGMP snooping proxy is disabled, the IGMP queries in VLAN, and the reports from hosts are flooded. Enabling IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to every query. It also reduces the number of reports that the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.

**15.2.2 IGMP Host Proxy Description**

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch's Ethernet 1 interface, which is configured as an IGMP host proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

![Figure 62: IP IGMP Host Proxy Implementation](image)
The IGMP proxy agent sends unsolicited IGMP joins when a \((S,G)\) or \((*,G)\) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM multicast border router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

15.2.3 Supported Features

For a list of the IGMP features that each Arista switch platform supports, refer to the supported features table here: https://www.arista.com/en/support/product-documentation/supported-features.

15.2.4 IGMP Protocols

- IGMP
- IGMP Snooping

15.2.4.1 IGMP

Networks use Internet Group Management Protocol (IGMP) to control the flow of layer 3 multicast traffic. Hosts request and maintain multicast group membership through IGMP messages. Multicast routers use IGMP to maintain a membership list of active multicast groups for each attached network.

- IGMP version 1 is defined in RFC 1112. Hosts can join multicast groups without a method to leave a group. Routers use a timeout-based process to determine when hosts lose interest in a group.
- IGMP version 2 is defined in RFC 2236. Version 2 adds leave messages that hosts use to terminate group membership.
- IGMP version 3 is defined in RFC 4604. Version 3 allows hosts to specify IP addresses within a group from where they receive traffic. Traffic from all other group addresses is blocked from the host.

With respect to each of its attached networks, a multicast router is either a querier or non-querier. Each physical network contains only one querier. A network with more than one multicast router designates the router with the lowest IP address as its querier.

Queriers solicit group membership information by periodically sending General Query messages. Queriers also receive unsolicited messages from hosts joining or leaving a multicast group. When a querier receives a message from a host, it updates its membership list for the group referenced in the message and the network where the message originated.

Queriers forward multicasts from remote sources only to networks as specified by its membership list. If a querier does not receive a report from a network host for a specific group, it removes the corresponding entry from the table and discontinues forwarding multicasts for that group on the network. Queriers also send group-specific queries after receiving a leave request from a host to determine if the network still contains active multicast group members. If it does not receive a membership report during the period defined by the last member query response interval, the querier removes the group-network entry from the membership list.

When a host receives a General Query, it responds with Membership Report messages for each of its multicast groups within the interval specified by the Max Response Time field in the query. IGMP suppresses multiple messages from different hosts on a network for the same group. Hosts send unsolicited Membership reports to join a multicast group and send leave messages to exit a group.
15.2.4.2  IGMP Snooping

IGMP snooping is a layer 2 switch process that extracts lists of hosts receiving multicast group traffic by monitoring IGMP network packets. The switch uses these lists to avoid flooding hosts with extraneous multicast traffic by sending group packets only to group members. Besides preventing local hosts from receiving traffic for groups they did not join, snooping prunes multicast traffic from links that do not contain IGMP clients.

When snooping is enabled, a switch examines IGMP packets sent between hosts connected to network switches and multicast routers (mrouters). When a switch finds an IGMP report from a multicast group recipient, it adds the recipient's port to the group multicast list. When the switch receives an IGMP leave, it removes the recipient's port from the list. Groups are removed upon the group timer expiry. When the switch finds an IGMP query packet or PIM hello packet from a multicast router, it adds the router's port to the port list for all multicast groups.

Snooping Querier

Snooping requires an IGMP querier in the network to create multicast group tables. An IGMP snooping querier performs the multicast router (mrouter) role when the network does not have a router. When the snooping querier is enabled on a VLAN, the switch periodically broadcasts IGMP queries and listens for IGMP Reports that indicate host group memberships.

Networks that contain multiple snooping queriers elect one as the querier, based on IP address. When IGMP snooping querier is enabled on a VLAN, the switch performs as a querier only when it is elected or it is the only snooping querier on the network.

L2 Report Flooding

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

IGMP Snooping Proxy

IGMP snooping proxy is an enhancement over IGMP snooping. When snooping proxy is enabled, the switch starts sending proxy queries periodically to the downstream hosts and collects the IGMP reports and updates the local state. Later, when the switch receives an IGMP query from an upstream router, the switch immediately responds with a report based on its local state.

When IGMP snooping proxy is disabled, the IGMP queries in VLAN, and the reports from hosts are flooded. Enabling IGMP snooping proxy prevents a sudden burst in IGMP report traffic in response to every query. It also reduces the number of reports that the IGMP Querier needs to process in the VLAN. However, it introduces a latency in the propagation of the IGMP state through the VLAN.

15.2.5  Configuring IGMP

This section describes the following configuration tasks:

- Enabling IGMP
- Configuring IGMP Settings

15.2.5.1  Enabling IGMP

Enabling PIM also enables IGMP on that interface. When the switch fills the multicast routing table, it only adds interfaces when the interface receives join messages from downstream devices or when the interface is directly connected to a member of the IGMP group.
By default, PIM and IGMP are disabled on an interface. Use the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command to enable PIM and IGMP on the configuration mode interface.

**Example**

- This command enables PIM and IGMP on VLAN interface 8.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#pim ipv4 sparse-mode
switch(config-if-Vl8)#
```

In the unlikely event that the IGMP agent needs to run on an interface without PIM being enabled, use the `ip igmp` command.

**Example**

- This command enables IGMP on VLAN interface 8 without enabling PIM.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#ip igmp
switch(config-if-Vl8)#
```

### 15.2.5.2 Configuring IGMP Settings

An interface that runs IGMP uses default protocol settings unless otherwise configured. The switch provides commands that alter startup query, last member query, and normal query settings.

**IGMP Version**

The switch supports IGMP versions 1 through 3. The `ip igmp version` command configures the IGMP version on the configuration mode interface. Version 3 is the default IGMP version.

**Example**

- This command configures IGMP version 3 on VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp version 3
switch(config-if-Vl4)#
```

**Startup Query**

Membership queries are sent at an increased frequency immediately after an interface starts up to quickly establish the group state. Query count and query interval commands adjust the period between membership queries for a specified number of messages.

The `ip igmp startup-query-interval` command specifies the interval between membership queries that an interface sends immediately after it starts up. The `ip igmp startup-query-count` command specifies the number of queries that the switches sends from the interface at the startup interval rate.

**Example**

- These commands define a startup interval of 15 seconds for the first 10 membership queries sent from VLAN interface 12.

```
switch(config)#interface vlan 12
switch(config-if-Vl12)#ip igmp startup-query-interval 150
switch(config-if-Vl12)#ip igmp startup-query-count 10
```
Membership Queries

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `ip igmp query-interval` command configures the frequency at which the active interface, as an IGMP querier, sends membership query messages.

The `igmp query-max-response-time` command configures the time that a host has to respond to a membership query.

Example

- These commands define a membership query interval of 75 seconds and a query response timer reset value of 45 seconds for queries sent from VLAN interface 15.

```bash
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp query-interval 75
switch(config-if-Vl15)#igmp query-max-response-time 450
switch(config-if-Vl15)#
```

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The `ip igmp last-member-query-count` (LMQC) command specifies the number of query messages the router sends in response to a group-specific or group-source-specific leave message.

The `ip igmp last-member-query-interval` command configures the transmission interval for sending group-specific or group-source-specific query messages to the active interface.

Example

- These commands program the switch to send 3 query messages, one every 25 seconds, when VLAN interface 15 receives an IGMP leave message.

```bash
switch(config)#interface vlan 15
switch(config-if-Vl15)#ip igmp last-member-query-interval 250
switch(config-if-Vl15)#ip igmp last-member-query-count 3
switch(config-if-Vl15)#
```

Static Groups

The `ip igmp static-group` command configures the configuration mode interface as a static member of the multicast group at the specified address. The router forwards multicast group packets through the interface without otherwise appearing or acting as a group member. No interface is a static member of a multicast group by default.

**Note:** To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the `pim ipv4 dr-priority` command to make it the DR by configuring its PIM DR value to be the highest on the network.
Example

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.45 10.1.1.1
```

15.2.6 Configuring IGMP Snooping

This section describes the following configuration tasks:

- Enabling Snooping
- Configuring Snooping Parameters
- Snooping Querier
- IGMP Snooping L2 Report Flooding
- IGMP Snooping Filters
- Configuring IGMP Snooping Proxy

15.2.6.1 Enabling Snooping

The switch provides two control settings for snooping IGMP packets:

- Global settings control the availability of IGMP snooping on the switch. Snooping is globally enabled by default.
- Per-VLAN settings control IGMP on individual VLANs. If snooping is enabled on the VLAN, it follows the global snooping state.

The `ip igmp snooping` command controls the global snooping setting. The `ip igmp snooping vlan` command configures snooping on individual VLANs.

Examples

- This command globally enables snooping on the switch.

```
switch(config)#ip igmp snooping
switch(config)#
```

- This command disables snooping on VLANs 2 through 4.

```
switch(config)#no ip igmp snooping vlan 2-4
switch(config)#
```

15.2.6.2 Configuring Snooping Parameters

Specifying a Static Multicast Router Connection

The `ip igmp snooping vlan multicast-router` command statically configures a port that connects to a multicast router to join all multicast groups. The port to the router must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command is for IGMP queriers that are known to connect through the network to a port on the switch.
Example

- This command configures the static connection to a multicast router through Ethernet port 3.

switch(config)#ip igmp snooping vlan 2 mrouter interface ethernet 3

Adding a Port to a Multicast Group

The ip igmp snooping vlan member command adds an a port to a multicast group. The IP address must be an unreserved IPv4 multicast address. The interface to the port must be in the specified VLAN range.

Example

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

switch(config)#ip igmp snooping vlan 7 static 237.2.1.4 interface ethernet 3

Robustness Variable

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The ip igmp snooping robustness-variable command configures the robustness variable for all snooping packets sent from the switch. The default value is 2.

Example

- This command sets the robustness-variable value to 3.

switch(config)#ip igmp snooping robustness-variable 3

Configuring Interface Startup Initial Query Times

The ip igmp snooping interface-restart-query command configures the interface startup initial query times in milliseconds. If nothing is configured, a default value of 2000 milliseconds is used. Issuing the command replaces any values already configured. Multiple values may be input in a single command; this makes the mechanism more resilient in the case of dropped packets.

Examples

- This command configures interfaces to send IGMP queries at 1000, 2000, and 4000 milliseconds (i.e., 1 second, 2 seconds, and 4 seconds) after an interface restart or spanning tree change.

switch(config)#ip igmp snooping interface-restart-query 1000 2000 4000

Example

- This command configures interfaces to send a single IGMP query of 5000 milliseconds (5 seconds) after an interface restart or spanning tree change.

switch(config)#ip igmp snooping interface-restart-query 5000
15.2.6.3  Snooping Querier

The IGMP snooping querier supports snooping by sending Layer 2 membership queries to hosts attached to the switch. Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

15.2.6.3.1  Enabling the Snooping Querier

Enabling the snooping querier on an interface requires the explicit configuration of a global querier address or a local querier address for the interface. See Configuring Snooping Querier Parameters.

The switch provides two control settings for controlling the snooping querier:

- The global setting controls the querier on VLANs for which there is no snooping querier command.
- VLAN querier settings take precedence over the global querier setting.

The `ip igmp snooping querier` command controls the global querier setting. When enabled globally, the querier is controlled on individual VLANs through the `ip igmp snooping vlan querier` command.

The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- `ip igmp snooping vlan querier` enables the querier on specified VLANs.
- `no ip igmp snooping vlan querier` disables the querier on specified VLANs.

Example

- These commands globally enables the snooping querier on the switch, explicitly disables snooping on VLANs 1-4, and explicitly enables snooping on VLANs 5-8.

```
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-4 querier
switch(config)#ip igmp snooping vlan 5-8 querier
switch(config)#
```

- This command removes the querier setting for VLANs 3-6:

```
switch(config)#default ip igmp snooping vlan 3-6 querier
switch(config)#
```

Globally Set the Snooping Querier Version

The `ip igmp snooping querier version` command configures the IGMP snooping querier version. Version 2 is the default IGMP snooping version.

Example

- This command globally configures IGMP snooping querier version 2.

```
switch(config)#ip igmp snooping querier version 2
switch(config)#
```

The `ip igmp snooping vlan querier version` command configures IGMP globally on the VLAN. Version 2 is the default IGMP snooping version.
Example

• This command configures IGMP snooping vlan querier version VLAN 5.

```
switch(config)#ip igmp snooping vlan 5 querier version 2
switch(config)#
```

15.2.6.3.2 Configuring Snooping Querier Parameters

Querier Address

The switch provides two IP addresses for setting the querier source:

• The global address is used by VLANs for which there is no querier address command.
• VLAN querier address settings take precedence over the global querier address.

The snooping querier address specifies the source IP address for IGMP snooping query packets that the switch transmits. The source address is also used to elect a snooping querier when the subnet contains multiple snooping queriers.

The default global querier address is not defined. When the configuration includes a snooping querier, a querier address must be defined globally or for each interface that enables a querier.

The `ip igmp snooping querier address` command sets the global querier source IP address for the switch. VLANs use the global address unless overwritten with the `ip igmp snooping vlan querier address` command. The default global address is not defined.

The `ip igmp snooping vlan querier address` command sets the source IP address for query packets transmitted from the specified VLAN. This command overrides the `ip igmp snooping querier address` for the specified VLAN.

Examples

• This command sets the source IP address for query packets that the switch transmits to 10.1.1.41.

```
switch(config)#ip igmp snooping querier address 10.1.1.41
switch(config)#
```

• This command sets the source IP address for query packets that VLAN 2 transmits to 10.14.1.1.

```
switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
switch(config)#
```

Membership Query Interval

The query interval is the period (seconds), between IGMP Membership Query message transmissions. The interval ranges from 5 to 3600 seconds.

The `ip igmp snooping querier query-interval` command specifies the global query interval for packets the switch sends as a snooper querier. The default global setting is 125 seconds.

The `ip igmp snooping vlan querier query-interval` command specifies the query interval for packets sent from the snooping querier to the specified VLAN, overriding the global setting. VLANs that do not specify a query interval use the global setting.

Examples

• This command sets a query interval of 150 seconds for queries transmitted from VLANs for which a query interval is not configured.

```
switch(config)#ip igmp snooping querier query-interval 150
```
This command sets the query interval of 240 seconds for queries transmitted from VLAN 2.

switch(config)#ip igmp snooping vlan 2 querier query-interval 240

Membership Query Response Interval

The Max Response Time field, in Membership Query messages, specifies the longest time a host can wait before responding with a Membership Report message. In all other messages, the sender sets the field to zero and the receiver ignores it. The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no Max Response Time command.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier max-response-time` command specifies the global Max Response Time value used in snooping query packets transmitted from the switch. Values range from 1 to 25 seconds with a default of 10 seconds. VLANs use the global setting unless overwritten with the `ip igmp snooping vlan querier max-response-time` command.

The `ip igmp snooping vlan querier max-response-time` command configures the Max Response Time field contents for packets transmitted from the specified VLAN, overriding the global setting.

Examples

- This command sets the maximum response time of 15 seconds for queries transmitted from VLANs for which a maximum response time is not configured.

  switch(config)#ip igmp snooping querier max-response-time 15

- This command sets a maximum response time of 5 seconds for queries that VLAN 2 transmits.

  switch(config)#ip igmp snooping vlan 2 querier max-response-time 5

Last Member Query

When the querier receives an IGMP leave message, it verifies the group has no remaining hosts by sending a set of group-specific queries at a specified interval. If the querier does not receive a response to the queries, it removes the group state and discontinues multicast transmissions.

The switch provides two values for setting this field:

- The global value is used by VLANs for which there is no last-member-query-interval defined.
- VLAN values take precedence over the global value for the specified VLAN.

The `ip igmp snooping querier last-member-query-interval` command specifies the global last-member-query-interval used in snooping query packets transmitted from the switch. This value is used for VLANs that do not have a value specified. Values range from 1 to 25 seconds with a global default of one second.

The `ip igmp snooping vlan querier last-member-query-interval` command configures the last-member-query-interval field contents for packets transmitted from the specified VLAN, overriding the global setting.
**Example**

- This command sets the global snooping querier last-member-query-interval to five seconds and the VLAN 10 last-member-query-interval to 12 seconds.

```
switch(config)#ip igmp snooping querier last-member-query-interval 5
switch(config)#ip igmp snooping vlan 10 querier last-member-query-interval 12
switch(config)#
```

**Interface Restart Query Spoofing**

When the port status (link status or spanning tree status) changes, an IGMP general query is spoofed based on the information of the last known IGMP querier. This facilitates faster network convergence time.

By default, interfaces wait 2000 milliseconds before sending the spoofed IGMP query. To configure the delay before the spoofed query is sent, use the `ip igmp snooping interface-restart-query` command. This setting is applied to all ports.

**Example**

- This command configures the switch to send general IGMP queries at 100 milliseconds, 200 milliseconds, and 300 milliseconds after interface restart or spanning tree status change.

```
switch(config)# ip igmp snooping interface-restart-query 100 200 300
```

**15.2.6.4 IGMP Snooping L2 Report Flooding**

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Report flooding is disabled by default and must be enabled globally before it can be enabled on individual interfaces.

The list of ports that can forward membership report messages must be explicitly configured. Commands are available to define lists of ports that are valid for all VLANs and port lists that are valid for specified VLAN ranges. Ports can forward membership reports only if they are configured to handle VLAN traffic, regardless of any report flooding configuration settings.

**Enabling L2 Report Flooding**

These commands enable L2 report flooding:

- `ip igmp snooping report-flooding` enables report flooding globally.
- `ip igmp snooping vlan report-flooding` enables report flooding on a specified VLAN range.

**Example**

- These commands enable L2 report flooding globally, and on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```

**Configuring Forwarding Ports**

These commands specify the ports that forward membership report messages:

- `ip igmp snooping report-flooding switch-port` configures ports globally.
- `ip igmp snooping vlan report-flooding switch-port` configures ports for a specified VLAN range.
Multicast

Example

- These commands enable Ethernet ports 5-9 to forward reports on all VLANs and ports 12-15 on VLANs 201-205.

```
switch(config)#ip igmp snooping report-flooding switch-port ethernet 5-9
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 12-15
switch(config)#
```

15.2.6.5 IGMP Snooping Filters

IGMP snooping filters assigns IGMP profiles only to Layer 2 interfaces, and for Layer 3 interfaces use multicast boundary filters to control the multicast groups that the interfaces can join. An IGMP profile specifies a filter type and a list of address ranges. The address ranges comprise the multicast groups covered by the profile. The filter type determines an interface’s accessibility to the multicast groups:

- Permit filters define the multicast groups the interface can join.
- Deny filters define the multicast groups the interface cannot join.

Profiles are created in IGMP-profile configuration mode, then applied to an interface in interface configuration mode.

The `ip igmp profile` command places the switch in IGMP profile configuration mode. The `permit` and `range` commands specify the profile's filter type and address range. A profile may contain multiple range statements to define a discontiguous address range.

Example

- These commands create an IGMP profile named list_1 by entering IGMP-profile configuration mode, configure the profile to permit multicast groups 231.22.24.0 through 231.22.24.127, and return the switch to global configuration mode.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#range 231.22.24.0 231.22.24.127
switch(config-igmp-profile-list_1)#exit
switch(config)#
```

The `ip igmp snooping filter` command applies an IGMP profile to the configuration mode interface.

Example

- These commands apply the list_1 snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```

15.2.6.5.1 Verifying IGMP Snooping

Show commands are available to display various configurations and IGMP snooping status. IGMP snooping that are viewable include:

- `show ip igmp snooping`
- `show ip igmp snooping counters`
- `show igmp snooping querier`
• show igmp snooping querier counters
• show igmp snooping querier membership

IGMP Snooping Status

The `show ip igmp snooping` command displays the switch’s IGMP snooping configuration.

Example

• This command displays the switch’s IGMP snooping configuration.

```
switch>show ip igmp snooping
Global IGMP Snooping configuration:
-------------------------------------------
IGMP snooping                  : Enabled
Robustness variable            : 2

Vlan 1 :
-------
IGMP snooping                  : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 20 :
-------
IGMP snooping                  : Enabled
Multicast router learning mode : pim-dvmrp

Vlan 2028 :

switch>
```

IGMP Snooping Counters

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

Example

• This command displays the number of messages received on each port.

```
switch>show ip igmp snooping counters
| Port | Queries | Reports | Input | Leaves | Others | Errors | |Queries| Reports | Leaves |
|------|---------|---------|-------|--------|--------|--------|-------|--------|--------|
| Cpu  | 3625    | 15249   | 106599| 4      | 269502 | 0      | 30242 | 102812 | 972    |
| Et1  | 0       | 0       | 0     | 0      | 0      | 0      | 0     | 0      | 0      |
| Et2  | 731     | 0       | 6     | 1      | 26     | 0      | 5415  | 0      | 0      |
| Et3  | 1448    | 0       | 10905 | 222    | 1037   | 0      | 15246 | 0      | 0      |
| Et4  | 2199    | 0       | 44475 | 21     | 288    | 0      | 15247 | 0      | 0      |
| Et5  | 2446    | 0       | 355   | 0      | 39     | 0      | 15211 | 0      | 0      |
| Et6  | 2487    | 0       | 475   | 13     | 0      | 0      | 15247 | 0      | 0      |
```
IGMP Snooping Querier

The `show igmp snooping querier` command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

Example

- This command displays the querier IP address, version, and port servicing each VLAN.

```
switch>show igmp snooping querier
Vlan  IP Address       Version  Port
----------------------------------------
1     172.17.0.37      v2       Po1
20    172.17.20.1      v2       Po1
26    172.17.26.1      v2       Cpu
2028  172.17.255.29    v2       Po1

switch>
```
IGMP Snooping Querier Counters

The `show igmp snooping querier counters` command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the counters from the querier.

```
switch> show igmp snooping querier counters
-----------------------------------------------------------------------
Vlan: 1   IP Addr: 100.0.0.1   Op State: Querier   Version: v3

  v1 General Queries Sent :0
  v1 Queries Received    :0
  v1 Reports Received    :0
  v2 General Queries Sent :1
  v2 Queries Received    :0
  v2 Reports Received    :25
  v2 Leaves Received     :0
  v3 General Queries Sent :655
  v3 GSQ Queries Sent    :0
  v3 GSSQ Queries Sent   :8
  v3 Queries Received    :654
  v3 Reports Received    :2385
  Error Packets          :0
  Other Packets          :0
switch>
```

IGMP Snooping Querier Membership

The `show igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

Example

- This command displays the membership from the querier fro VLAN 1.

```
switch> show igmp snooping querier membership
----------------------------------------------------------
Vlan: 1   Elected: 100.0.0.1   QQI: 125   QRV: 2   QRI: 10   GMI: 260

Groups   Mode   Ver   Num of Sources
--------------------------------------
  10.0.0.2    EX   v3   0   []
  10.0.0.3    IN   v3   2   [ 3.3.3.3, 3.3.3.4 ]
  10.0.0.4    EX   v3   0   []
  10.0.0.13   EX   v3   0   []
  10.0.0.22   EX   v3   0   []
  10.0.0.1    IN   v3   3   [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```
15.2.6.6 Configuring IGMP Snooping Proxy

Use the ip igmp snooping proxy command to enable IGMP snooping proxy globally. Enabling IGMP snooping proxy enables it for all VLANs where IGMP snooping is enabled. IGMP snooping proxy is globally disabled by default.

Use the ip igmp snooping proxy command to enable IGMP snooping proxy globally. Use the no ip igmp snooping vlan proxy command to disable IGMP snooping proxy on specified VLANs.

Examples

This command globally enables IGMP snooping proxy on the switch.

```
switch(config)#ip igmp snooping proxy
switch(config)#
```

This command disables IGMP snooping proxy on VLANs 2 through 4.

```
switch(config)#no ip igmp snooping proxy vlan 2-4 proxy
switch(config)#
```

15.2.6.6.1 Configuring Snooping Proxy Querier

To configure the IGMP snooping proxy querier use the existing ip igmp snooping querier commands. For more information on these commands, refer to IGMP and IGMP Snooping Commands.

- **Note:** The proxy querier by default uses 0.0.0.0 IP address.

Example:

In this example, IGMP snooping proxy is enabled using the ip igmp snooping proxy command and the snooping proxy is set to reports for all the VLANs except VLANs 100 through 110 using the ip igmp snooping vlan command. The proxy querier operates in version 3 and sends queries at a 15-second interval and hosts can take up to 5 seconds to respond.

```
switch(config)#ip igmp snooping proxy
switch(config)#no ip igmp snooping vlan 100-110 proxy
switch(config)#ip igmp snooping querier query-interval 15
switch(config)#ip igmp snooping querier max-response-time 5
switch(config)#ip igmp snooping querier version 3
switch(config)#ip igmp snooping querier
switch(config)#
```

15.2.7 IGMP Host Proxy

Interfaces on the switch can be configured to serve as IGMP host proxies. An IGMP host proxy exchanges IGMP reports (joins/leaves) between networks whose connection does not support PIM along network boundaries.

- IGMP Host Proxy Description
- IGMP Host Proxy Configuration

15.2.7.1 IGMP Host Proxy Description

The figure displays a typical IGMP host-proxy implementation. The customer network connects to the sender network through the edge switch’s Ethernet 1 interface, which is configured as an IGMP host
proxy. PIM is enabled within the sender and customer networks but not on the connection between the networks.

![Diagram of IP IGMP Host Proxy Implementation](image)

**Figure 63: IP IGMP Host Proxy Implementation**

The IGMP proxy agent sends unsolicited IGMP joins when a (S,G) or (*,G) entry arrives in the multicast routing table (mroute table). Subsequently, IGMP reports are sent when queries or group-specific queries arrive on the host proxy interface. When the customer network is void of active listeners, the connection eventually expires and the senders stop transmitting to the network.

IGMP host proxy requires the following:

- PIM multicast border router (MBR) must be enabled on the interface.
- IP IGMP and IP multicast must be enabled.
- The switch must be an RP or in each host's RP path.
- Fast-drop entries are required when there are no interested listeners for the group.

IGMP host proxy is configurable to filter for specific multicast groups and sources.

### 15.2.7.2 IGMP Host Proxy Configuration

**Enabling IGMP Host Proxy**

Enable PIM MBR on the interface using the `pim ipv4 border-router` command. The IGMP host proxy service is then configured on the interface using the `ip igmp host-proxy` command. When the host proxy is configured, it sends reports for (S,G) entries in the multicast routing (mroute) table if these are the only routes there; if there are any (*,G) entries, it sends reports only for these. To send reports for a specific group even when there is no (*, G) entry in the mroute table for that group, include the group address in the `ip igmp host-proxy` command. Multiple `ip igmp host-proxy` statements are required to specify multiple groups. The interval between IGMP reports is configured by `ip igmp host-proxy report-interval`.

**Host Proxy IGMP Version and Source Filtering**

IGMP host proxies can be configured with IGMP versions 1, 2, or 3, and use version 3 by default. When the host-proxy IGMP version is set to 3, the proxy can explicitly include or exclude source addresses. Otherwise, include/exclude configuration for source addresses is ignored. The IGMP version of unsolicited reports is specified with the `ip igmp host-proxy version` command. Reports that are triggered by IGMP queries, however, are sent in the same IGMP version as the received query. (An interface may also have a different IGMP version configured on it for other purposes using the `ip igmp version` command.)

**Using ACLs**

IGMP host proxy can also be enabled for the addresses defined by an ACL; if one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if
the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

Disabling Host Proxy or Removing an Individual Group or Source

The no `igmp host-proxy` command can be entered with group or source parameters to remove the specified group or source from the list. Entering the no `igmp host-proxy` command without specifying group or source disables the forwarding of all IGMP reports on the interface.

Examples

- These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy
```

- These commands enable IGMP host proxy on Ethernet interface 18 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.

```
switch(config)#interface ethernet 18
switch(config-if-Et18)#pim ipv4 border-router
switch(config-if-Et18)#ip igmp host-proxy 231.10.10.1
```

- These commands enable IGMP host proxy on Ethernet interface 19 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.

```
switch(config)#interface ethernet 19
switch(config-if-Et19)#pim ipv4 border-router
switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et19)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
```

- These commands configure an IGMP host proxy interval of five seconds on port channel 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy report-interval 5
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL “acl1.”

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
```

2753
15.2.8 IGMP and IGMP Snooping Commands

IGMP Configuration Commands (Interface Configuration Mode)

- igmp query-max-response-time
- ip igmp last-member-query-count
- ip igmp last-member-query-interval
- ip igmp query-interval
- ip igmp router-alert
- ip igmp startup-query-count
- ip igmp startup-query-interval
- ip igmp static-group
- ip igmp static-group acl
- ip igmp static-group range
- ip igmp version

IGMP Clear Commands

- clear ip igmp group
- clear ip igmp statistics

IGMP Display Commands

- show ip igmp groups
- show ip igmp groups count
- show ip igmp interface
- show ip igmp static-groups
- show ip igmp static-groups acl
- show ip igmp static-groups group
- show ip igmp statistics

IGMP Snooping Configuration Commands (Global Configuration Mode)

- ip igmp
- ip igmp profile
- ip igmp snooping
- ip igmp snooping interface-restart-query
- ip igmp snooping proxy
- ip igmp snooping querier
- ip igmp snooping querier address
- ip igmp snooping querier last-member-query-count
- ip igmp snooping querier last-member-query-interval
- ip igmp snooping querier max-response-time
- ip igmp snooping querier query-interval
- ip igmp snooping querier startup-query-count
- ip igmp snooping querier startup-query-interval
- ip igmp snooping querier version
- ip igmp snooping report-flooding
- ip igmp snooping report-flooding switch-port
- ip igmp snooping restart query-interval
- ip igmp snooping robustness-variable
• ip igmp snooping vlan
• ip igmp snooping vlan fast-leave
• ip igmp snooping vlan max-groups
• ip igmp snooping vlan member
• ip igmp snooping vlan multicast-router
• ip igmp snooping vlan proxy
• ip igmp snooping vlan querier
• ip igmp snooping vlan querier address
• ip igmp snooping vlan querier last-member-query-count
• ip igmp snooping vlan querier last-member-query-interval
• ip igmp snooping vlan querier max-response-time
• ip igmp snooping vlan querier query-interval
• ip igmp snooping vlan querier startup-query-count
• ip igmp snooping vlan querier startup-query-interval
• ip igmp snooping vlan querier version
• ip igmp snooping vlan report-flooding
• ip igmp snooping vlan report-flooding switch-port

IGMP Configuration Commands (Interface Configuration Mode)
• ip igmp snooping filter

IGMP Snooping Clear Commands
• clear ip igmp snooping counters

IGMP Snooping Display Commands
• show igmp snooping querier
• show igmp snooping querier counters
• show igmp snooping querier membership
• show ip igmp profile
• show ip igmp snooping
• show ip igmp snooping counters
• show ip igmp snooping counters ethdev-pams
• show ip igmp snooping groups
• show ip igmp snooping groups count
• show ip igmp snooping mrouter
• show ip igmp snooping report-flooding

IGMP Profile Configuration Mode Commands
• permit / deny
• range

IGMP Host Proxy Commands
• ip igmp host-proxy
• ip igmp host-proxy report-interval
• ip igmp host-proxy version
• show ip igmp host-proxy config-sanity
• show ip igmp host-proxy interface
15.2.8.1 clear ip igmp group

The **clear ip igmp group** command deletes IGMP cache entries as follows:

- **clear ip igmp group** all entries from the IGMP cache.
- **clear ip igmp group** gp_addr all entries for a specified multicast group.
- **clear ip igmp group** interface int_id all entries that include a specified interface.
- **clear ip igmp group** gp_addr interface int_id all entries for a specified interface in a specified group.

**Command Mode**

Privileged EXEC

**Command Syntax**

`clear ip igmp group [ gp_addr ][ interface INT_ID ]`

**Parameters**

- *gp_addr* multicast group IP address (dotted decimal notation).
- *INT_ID* interface name. Options include:
  - *ethernet* e_num Ethernet interface specified by e_num.
  - *loopback* l_num Loopback interface specified by l_num.
  - *management* m_num Management interface specified by m_num.
  - *port-channel* p_num Port-channel interface specified by p_num.
  - *vlan* v_num VLAN interface specified by v_num.
  - *vxlan* vx_num VXLAN interface specified by vx_num.

**Examples**

- This command deletes all IGMP cache entries for the multicast group 231.23.23.14.

  ```
  switch#clear ip igmp group 231.23.23.14
  switch#
  ```

- This command deletes IGMP cache entries for Ethernet interface 16 in multicast group 226.45.10.45.

  ```
  switch#clear ip igmp group 226.45.10.45 interface ethernet 16
  switch#
  ```
15.2.8.2 clear ip igmp snooping counters

The clear ip igmp snooping counters command resets the snooping message counters for the specified interface. The snooping counters for all interfaces are reset if the command does not include an interface name.

The show ip igmp snooping counters command displays the counter contents. See the show ip igmp snooping counters command description for a list of available snooping counters.

Command Mode
Privileged EXEC

Command Syntax

clear ip igmp snooping counters [INT_NAME]

Parameters
• INT_NAME interface name. Formats include:
  • ethernet e_num Ethernet interface specified by e_num.
  • port-channel p_num Port-channel interface specified by p_num.
  • switch virtual interface to an L2 querier.

Example
• This command clears the snooping counters for messages received on Ethernet interface 15.

switch(config)#clear ip igmp snooping counters ethernet 15
switch(config)#
15.2.8.3  clear ip igmp statistics

The clear ip igmp statistics command resets IGMP transmission statistic counters for the specified interface.

Command Mode
Privileged EXEC

Command Syntax

\[
\text{clear ip igmp statistics [INTF_ID]}
\]

Parameters

- INTF_ID nterface name. Options include:
  - <no parameter> all interfaces.
  - \text{interface ethernet } e\_num Ethernet interface specified by \text{e\_num}.
  - \text{interface loopback } l\_num Loopback interface specified by \text{l\_num}.
  - \text{interface management } m\_num Management interface specified by \text{m\_num}.
  - \text{interface port-channel } p\_num Port-channel interface specified by \text{p\_num}.
  - \text{interface vlan } v\_num VLAN interface specified by \text{v\_num}.
  - \text{interface xlan } vx\_num VXLAN interface specified by \text{vx\_num}.

Examples

- This command resets IGMP transmission statistic counters on Ethernet 1 interface.

```
switch#clear ip igmp statistics interface ethernet 1
switch#
```
15.2.8.4 igmp query-max-response-time

The `igmp query-max-response-time` command configures the query-max-response-time variable for the configuration mode interface. This variable is used to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The router with the lowest IP address on a subnet sends membership queries as the IGMP querier. When a membership query is received from a source with a lower IP address, the router resets its query response timer. Upon timer expiry, the router begins sending membership queries. If the router subsequently receives a membership query originating from a lower IP address, it stops sending membership queries and resets the query response timer.

The `no igmp query-max-response-time` and `default igmp query-max-response-time` commands restore the default query-max-response-time of 10 seconds for the configuration mode interface by removing the corresponding `igmp query max-response-time` command from running-config.

Command Mode
Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

Command Syntax
`igmp query-max-response-time period`
`no igmp query-max-response-time`
`default igmp query-max-response-time`

Parameters
- `period` maximum response time (deciseconds). Values range from 1 to 31744 (52 minutes, 54 seconds). Default is 100 (ten seconds).

Example
- This command configures the query-max-response-time of 18 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)# igmp query-max-response-time 180
switch(config-if-Vl4)#
```
15.2.8.5  ip igmp host-proxy report-interval

The **ip igmp host-proxy report-interval** command configures the period between unsolicited join reports that the switch sends as an IGMP host proxy from the configuration mode interface to a sender network after a (S,G) or (*,G) entry arrives in the multicast route (mroute) table. When the interface receives a query in response, this interval is set to the **ip igmp last-member-query-interval**. This command also enables the host proxy on the configuration mode interface if it was not previously enabled.

The **no ip igmp host-proxy report-interval** and **default ip igmp host-proxy report-interval** commands reset the query interval to the default value of one second by removing the corresponding **ip igmp host-proxy report-interval** command from running-config. The **no ip igmp host-proxy** and **default ip igmp host-proxy** commands also remove the corresponding **report-interval** command.

**Command Mode**

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

**Command Syntax**

`ip igmp host-proxy report-interval period`

`no ip igmp host-proxy report-interval`

`default ip igmp host-proxy report-interval`

**Parameters**

- **period** transmission interval (seconds) between consecutive reports. Value range: 1 (one second) to 31744 (8 hours, 49 minutes, 4 seconds). Default is 1 (one second).

**Example**

- These commands configures a IGMP host proxy interval of five seconds on port channel 100.

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy report-interval 5
switch(config-if-Po100)#
```
15.2.8.6 ip igmp host-proxy version

The `ip igmp host-proxy version` command configures the version number to be used in unsolicited reports when the interface is serving as an IGMP host proxy. To configure the IGMP version used by the interface for other purposes, use the `ip igmp version` command instead.

The `no ip igmp host-proxy version` and `default ip igmp host-proxy version` commands reset the version to the default value of 3.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
ip igmp host-proxy version version_number
no ip igmp host-proxy version
default ip igmp host-proxy version
```

**Parameters**

- `version_number` values range from 1 to 3. The default value is 3.

**Example**

```
switch(config)#interface port-channel 100
switch(config-if-Po100)#ip igmp host-proxy version 2
switch(config-if-Po100)#
```
15.2.8.7  ip igmp host-proxy

The `ip igmp host-proxy` command enables the IGMP host proxy service on the configuration mode interface. The IGMP host proxy performs IGMP joins and leaves between networks that are directly connected by an exchange that does not support PIM on the network boundary.

Note: For an interface to serve as an IGMP host proxy, PIM MBR must also be enabled on that interface using the `pim ipv4 border-router` command.

The IGMP host proxy sends unsolicited IGMP join reports when an (S,G) or (*,G) entry arrives in the multicast routing (mroute) table. Reports are subsequently sent upon the arrival of queries on the interface. The interval between IGMP reports is configured through `ip igmp host-proxy report-interval`.

The `ip igmp host-proxy` command can also specify a group address; this ensures that reports are generated for the specified group even if there is no (*,G) entry in the mroute table for that group. Multiple `ip igmp host-proxy` statements are required to specify multiple groups.

When the host proxy IGMP version is set to 3 using the `ip igmp host-proxy version` command, the `ip igmp host-proxy` command can also include or exclude source addresses. These options are ignored when the interface runs host proxy IGMP version 1 or 2. Note that the IGMP version set using the `ip igmp version` command does not affect host proxy behavior.

An ACL can also be used in place of a group address by using the `access-list` option. If one or more groups are configured in addition to ACLs, the groups are processed first. Implicit deny in the ACL is ignored, but if the ACL includes an explicit deny rule, then the interface sends joins only to groups configured directly on the interface or included in a permit ACL. Deny rules take precedence over permit rules. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

The `no ip igmp host-proxy` and `default ip igmp host-proxy` commands remove the corresponding `ip igmp host-proxy` command from `running-config`. When these commands do not include a group address, all `ip igmp host-proxy` statements are deleted. When inclusion or exclusion parameters are not specified, all statements with the specified group address are deleted.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

Command Syntax

```
ip igmp host-proxy [ GROUP_ADDRESS [SOURCE_ADDRESS ]] | [ access-list acl]
no ip igmp host-proxy [ GROUP_ADDRESS [SOURCE_ADDRESS]]
default ip igmp host-proxy [ GROUP_ADDRESS [SOURCE_ADDRESS]]
```

Parameters

- **GROUP_ADDRESS**  IPv4 address of group address for which host proxy sends reports.
  - `<no parameter>` only groups for which there is a (*,G) entry in the mroute table.
  - `ipv4_address` IP address of multicast group (dotted decimal notation). This ensures that reports are generated for this group even if it does not have a (*,G) entry in the mroute table.

- **SOURCE_ADDRESS**  IP address of a host that originates multicast data packets.
  - `<no parameter>` address.
  - `exclude ipv4_address` Proxy does not send reports for specified source address.
  - `include ipv4_address` Proxy always sends reports for specified source address.
Multicast

Commands that list at least one parameter must specify a group address. Parameters may be listed in any order. When a command specifies include and exclude parameters, the exclude parameter is ignored.

- **access-list acl** specifies an access control list (ACL); a join is sent for all groups and/or sources obtained by processing the rules from all configured ACLs.
- **version version** specifies the IGMP version on IGMP host-proxy interface. The value ranges from 1 to 3. Default value is 3.

**Guidelines**

Multiple statements for a group address may be configured. The effect of entering a command depends on previously entered commands. The following describes command combination:

- **ip igmp host-proxy**: IGMP host proxy is enabled for all multicast groups and their source addresses. When enabled for all group addresses, the source address list cannot be restricted.
- **ip igmp host-proxy group_ipv4**: IGMP host proxy is enabled for a specified multicast group. The list of source addresses for this group is not restricted. Enabling host proxy for another group address requires another **ip igmp host-proxy** command.
- **ip igmp host-proxy group_ipv4 exclude source_ipv4**: IGMP host proxy is enabled for the specified multicast group. Sources for this group include all addresses not in an exclude statement. Multiple source addresses for the group are excluded by multiple statements.
- **ip igmp host-proxy group_ipv4 include source_ipv4**: IGMP host proxy is enabled for the specified group address for only the specified source address. Additional statements are required to include other source addresses for the group. The presence of one include parameter invalidates all exclude statements for the specified multicast group.
- **ip igmp host-proxy access-list acl**: IGMP host proxy is enabled for the addresses defined by the specified ACL. If one or more groups are configured in addition to ACLs, the groups are processed first. If the ACL has a “deny all” rule for a group, then this filter takes precedence over configurations with include/exclude keywords or permit/deny rules for that group. If a group is configured with no filters and a host-proxy is configured with an ACL with rules having filters for the group, or configured with groups and source filters, then the filters are applied to the group.

**Example**

- These commands enable IGMP host proxy on Ethernet interface 17 for all multicast group addresses.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.1. The list of source addresses is not restricted.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.1
```

- These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.2. The list of source addresses only excludes 10.4.4.1 and 10.4.5.2.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.4.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.2 exclude 10.4.5.2
```
• These commands enable IGMP host proxy on Ethernet interface 17 for the multicast group at 231.10.10.3. The list of source address for this group only includes 10.5.5.1 and 10.5.5.2

```bash
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.1
switch(config-if-Et17)#ip igmp host-proxy 231.10.10.3 include 10.5.5.2
switch(config-if-Et17)#
```

• These commands enable IGMP host proxy on Ethernet interface 17 for the group address(es) specified in ACL “acl1”

```bash
switch(config)#interface ethernet 17
switch(config-if-Et17)#pim ipv4 border-router
switch(config-if-Et17)#ip igmp host-proxy access-list acl1
switch(config-if-Et17)#
```
The `ip igmp last-member-query-count` command specifies the number of query messages the switch sends in response to a group-specific or group-source-specific leave message.

After receiving a message from a host leaving a group, the switch sends query messages at intervals specified by `ip igmp last-member-query-interval`. If the switch does not receive a response to the queries after sending the number of messages specified by this parameter, it stops forwarding messages to the host.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp query-interval`.

The `no ip igmp last-member-query-count` and `default ip igmp last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp last-member-query-count` command from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ip igmp last-member-query-count number`
- `no ip igmp last-member-query-count`
- `default ip igmp last-member-query-count`

**Parameters**

- `number` query message quantity. Values range from 0 to 3. Default is 2.

**Example**

- This command configures the last-member-query-count to 3 on VLAN interface 4.

```bash
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp last-member-query-count 3
switch(config-if-Vl4)#
```
15.2.8.9    ip igmp last-member-query-interval

The ip igmp last-member-query-interval command configures the switch's transmission interval for sending group-specific or group-source-specific query messages from the configuration mode interface.

When a switch receives a message from a host that is leaving a group it sends query messages at intervals set by this command. The ip igmp startup-query-count specifies the number of messages that are sent before the switch stops forwarding packets to the host.

If the switch does not receive a response after this period, it stops forwarding traffic to the host on behalf of the group, source, or channel.

The no ip igmp last-member-query-interval and default ip igmp last-member-query-interval commands reset the query interval to the default value of one second by removing the ip igmp last-member-query-interval command from running-config.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

Command Syntax

ip igmp last-member-query-interval period
no ip igmp last-member-query-interval
default ip igmp last-member-query-interval

Parameters

• period transmission interval (deciseconds) between consecutive group-specific query messages.
  Value range: 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 10 (one second).

Example

• This command configures the last member query interval of 6 seconds for VLAN interface 4.

  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp last-member-query-interval 60
  switch(config-if-Vl4)#
The `ip igmp profile` command places the switch in IGMP-profile configuration mode to configure an IGMP profile. IGMP profiles control the multicast groups that an interface can join.

Profiles consist of the filter type and an address range:

- Filter types specify accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.

Profiles are deny filters by default.

- Address ranges specify a list of addresses and ranges:
  - In permit filters, permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

Implementing IGMP filtering affects IGMP report forwarding as follows:

- IGMPv2: Report is forwarded to mrouters for permitted groups and dropped for disallowed groups.
- IGMPv3: There may be multiple group records in a report.
  - No groups are allowed: The report is dropped.
  - All groups are allowed: The report is forwarded to mrouter ports as normal.
  - Some groups are allowed: A revised report is forwarded to mrouter ports.

The revised report includes records for the allowed group addresses with the same source MAC and IP addresses.

The `no ip igmp profile` and `default ip igmp profile` commands delete the specified IGMP profile from `running-config`.

IGMP-profile configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting IGMP-profile configuration mode does not affect the configuration. The `exit` command returns the switch to global configuration mode.

Command Mode

Global Configuration

Command Syntax

```
ip igmp profile profile_name
no ip igmp profile profile_name
default igmp profile profile_name
```

Parameters

- `profile_name` name of the IGMP profile.

Commands Available in igmp-profile Configuration Mode

- `permit / deny`
- `range`

Related Commands

- `ip igmp snooping filter` applies an IGMP snooping filter to a configuration mode interface.

Example

- These commands enter IGMP-profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
```
switch(config-igmp-profile-list_1)#
15.2.8.11  ip igmp query-interval

The *ip igmp query-interval* command configures the frequency at which the configuration mode interface, as an IGMP querier, sends host-query messages.

An IGMP querier sends host-query messages to discover the multicast groups that have members on networks attached to the interface. The switch implements a default query interval of 125 seconds.

The *no ip igmp query-interval* and *default ip igmp query-interval* commands reset the IGMP query interval to the default value of 125 seconds by removing the *ip igmp query-interval* command from *running-config*.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `ip igmp query-interval period`
- `no ip igmp query-interval`
- `default ip igmp query-interval`

**Parameters**

- *period* interval (seconds) between IGMP query messages. Values range from 1 to 3175 (52 minutes, 55 seconds). Default is 125.

**Example**

- This command configures the query-interval of 2 minutes, 30 seconds for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp query-interval 150
switch(config-if-Vl4)#
```
15.2.8.12  ip igmp router-alert

The **ip igmp router-alert** command configures the switch disposition of inbound IGMP packets to the configuration mode interface based on the presence of the router-alert option in the IP header. By default, the port accepts all IGMP packets that arrive on the local subnet and rejects all other packets that arrive without the router-alert option.

The command provides three IGMP packet disposition options:

- **mandatory**: packets are accepted only when router-alert is present.
- **optional**: packets are accepted regardless of router-alert presence.
- **optional connected**: packets are accepted from the same subnet; other packets require router-alert.

The **no ip igmp router-alert** and **default ip igmp router-alert** commands reset the default setting of optional connected on the configuration mode interface by removing the corresponding **ip igmp router-alert** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

**Command Syntax**

```plaintext
ip igmp router-alert DISPOSITION
no ip igmp router-alert
default ip igmp router-alert
```

**Parameters**

- **DISPOSITION** IGMP packet disposition method. Options include:
  - **mandatory** Rejects packets if router-alert is not present.
  - **optional** Accepts packets regardless of router-alert presence.
  - **optional connected** Accepts packets from same subnet. Other packets require router-alert.

**Example**

- This command configures the switch to accept IGMP packets on Ethernet interface 8 only if the IP header contains router alert.

```plaintext
switch(config)#interface ethernet 8
switch(config-if-Et8)#ip igmp router-alert mandatory
switch(config-if-Et8)#
```
15.2.8.13  ip igmp snooping filter

The **ip igmp snooping filter** command applies the specified IGMP snooping profile to the configuration mode interface. An IGMP snooping profile specifies the multicast groups that an interface may join. Profiles consist of the filter type and an address range:

- Filter type: Specifies accessibility to the listed address range:
  - Permit filters define the multicast groups the interface can join.
  - Deny filters define the multicast groups the interface cannot join.
- Address range: Specifies a list of addresses and ranges.
  - In permit filters, the permitted groups are specified by the address range.
  - In deny filters, all groups are permitted except those specified by the address range.

An interface without a snooping profile assignment may join any multicast group.

Snooping profiles are configured in IGMP-profile configuration mode (**ip igmp profile**).

The **no ip igmp snooping filter** and **default ip igmp snooping filter** commands restore the default setting of allowing an interface to join any multicast group by deleting the corresponding **ip igmp snooping filter** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

**Command Syntax**

```
ip igmp snooping filter profile_name
no ip igmp snooping filter [profile_name]
default ip igmp snooping filter [profile_name]
```

**Parameters**

- **profile_name** name of profile assigned to interface.

**Example**

- This command applies the list_1 snooping profile to Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#ip igmp snooping filter list_1
switch(config-if-Et7)#
```
ip igmp snooping interface-restart-query

The `ip igmp snooping interface-restart-query` command configures the interface startup initial query time used for IGMP query spoofing. When an interface restarts or there is a change to the spanning tree, the interface will send general IGMP queries after this interval. The query is based on the information of the last known IGMP querier, and serves to facilitate faster network convergence times.

Multiple values can be configured with a single command; issuing the command again replaces any previously configured value(s).

The `no ip igmp snooping interface-restart-query` and `default ip igmp snooping interface-restart-query` commands restore the default setting of 2000 milliseconds by deleting the corresponding `ip igmp snooping interface-restart-query` command from `running-config`.

**Command Mode**
General Configuration

**Command Syntax**

```
ip igmp snooping interface-restart-query query_time
no ip igmp snooping interface-restart-query
```

**Parameters**

- `query_time` interval (in milliseconds) after an interface restart or spanning tree change at which the interface will send general IGMP queries. Values range from 100 to 50000 milliseconds; default is 2000.

**Example**

- This command configures interfaces to send IGMP queries at 100, 200, and 300 milliseconds after an interface restart or spanning tree change.

```
switch(config)#ip igmp snooping interface-restart-query 100 200 300
switch(config)#
```
15.2.8.15  ip igmp snooping proxy

The **ip igmp snooping proxy** command enables snooping proxy globally. By default, IGMP snooping proxy is disabled globally.

When the snooping proxy is enabled globally, it enables IGMP snooping proxy on an individual VLANs and when the IGMP snooping proxy is globally disabled the snooping proxy is disabled on individual VLANs.

The **no ip igmp snooping proxy** and **default ip igmp snooping proxy** commands disable snooping proxy globally and on individual VLANs by removing the **ip igmp snooping proxy** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- **ip igmp snooping proxy**
- **no ip igmp snooping proxy**
- **default ip igmp snooping proxy**

**Examples**

- This command globally enables snooping proxy on the switch.

  switch(config)#ip igmp snooping proxy
  switch(config)#

- This command explicitly disables IGMP snooping proxy on VLAN 20.

  switch(config)#no ip igmp snooping vlan 20 proxy
  switch(config)#
15.2.8.16  ip igmp snooping querier address

The `ip igmp snooping querier address` command sets the global querier source IP address, which specifies the source address for packets transmitted from VLANs for which a querier address (`ip igmp snooping vlan querier address`) is not configured. To use a snooping querier, an address must be explicitly configured globally or for the VLAN.

The switch does not define a default global querier address.

The `no ip igmp snooping querier address` and `default ip igmp snooping querier address` commands remove the global querier address command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
ip igmp snooping querier address ipv4_address
no ip igmp snooping querier address
default ip igmp snooping querier address
```

**Parameters**

- `ipv4_address` source IPv4 address.

**Example**

- This command sets the source IP address to 10.1.1.41 for query packets transmitted from the switch.

```
switch(config)#ip igmp snooping querier address 10.1.1.41
switch(config)#
```
15.2.8.17  ip igmp snooping querier last-member-query-count

The `ip igmp snooping querier last-member-query-count` command configures the global IGMP snooping querier last member query count (LMQC) value. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

Setting LMQC to 1 causes the loss of one packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by `ip igmp snooping querier query-interval`.

VLANs use the global value when they are not assigned a value (`ip igmp snooping vlan querier last-member-query-count`). VLAN commands take precedence over the global value. The default global value is specified by `ip igmp snooping robustness-variable`.

The `no ip igmp snooping querier last-member-query-count` and `default ip igmp snooping querier last-member-query-count` commands reset the LMQC to the default value by removing the corresponding `ip igmp snooping querier last-member-query-count` command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping querier last-member-query-count number`
- `no ip igmp snooping querier last-member-query-count`
- `default ip igmp snooping querier last-member-query-count`

**Parameters**

- `number` query message quantity. Value ranges from 1 to 3. Default is set by robustness-variable.

**Example**

- This command configures the global last-member-query-count to 3.

```
switch(config)#ip igmp snooping querier last-member-query-count 3
switch(config)#show igmp snooping querier status

Global IGMP Querier status
-----------------------------------------
admin state                      : Disabled

 101     Disabled 0.0.0.0 125.0 10.0 255.0 Non-Querier v2

switch(config)#
```
15.2.8.18  ip igmp snooping querier last-member-query-interval

The ip igmp snooping querier last-member-query-interval command sets the global IGMP snooping last member query interval. The default interval is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

VLANs not assigned a last member query interval value (ip igmp snooping vlan querier last-member-query-interval) use the global value. VLAN commands take precedence over the global value.

The no ip igmp snooping querier last-member-query-interval and default ip igmp snooping querier last-member-query-interval commands reset the last-member-query-interval value the default interval of one second by removing the ip igmp snooping querier last-member-query-interval statement from running-config.

Command Mode
Global Configuration

Command Syntax

ip igmp snooping querier last-member-query-interval period
no ip igmp snooping querier last-member-query-interval
default ip igmp snooping querier last-member-query-interval

Parameters

• period last member query interval (seconds). Value ranges from 1 to 25. Default is one second.

Related Commands

• ip igmp snooping vlan querier last-member-query-interval assign a last member query interval value to the specified VLANs.

Example

• This command sets the IGMP snooping querier last-member-query-interval to five seconds.

switch(config)#ip igmp snooping querier last-member-query-interval 5
switch(config)# 
15.2.8.19  ip igmp snooping querier max-response-time

The `ip igmp snooping querier max-response-time` command specifies the global max-
response-time value. The switch uses max-response-time to set the Max Response Time field in
outbound Membership Query messages. Max Response Time specifies the maximum period a
recipient can wait before responding with a Membership Report.

VLANs not assigned a max-response-time value (`ip igmp snooping vlan querier max-response-time`) use the global value. VLAN commands take precedence over the global value.

Values range from 1 to 25 seconds. The default global value is 10 seconds.

The `no ip igmp snooping querier max-response-time` and `default ip igmp
snooping querier max-response-time` commands restore the global max-response-time
default value by removing the `ip igmp snooping querier max-response-time` statement from
`running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping querier max-response-time resp_sec
no ip igmp snooping querier max-response-time
default ip igmp snooping querier max-response-time
```

**Parameters**

- `resp_sec` max-response-time value (seconds). Values range from 1 to 25. Default (global) is 10.

**Example**

- This command sets the global max-response-time to 15 seconds.

```
switch(config)#ip igmp snooping querier max-response-time 15
switch(config)#
```
15.2.8.20 ip igmp snooping querier query-interval

The `ip igmp snooping querier query-interval` command sets the global query interval. This command also sets the query-interval of IGMP Snooping when using IGMP version 2. Values range from 5 to 3600 seconds. The default global value is 125 seconds. The query interval is the period between IGMP Membership Query messages sent from the querier. The global value specifies the query interval for VLANs with no query-interval command.

VLANs not assigned a query interval value (`ip igmp snooping vlan querier query-interval`) use the global value. VLAN commands take precedence over the global value.

The `no ip igmp snooping querier query-interval` and `default ip igmp snooping querier query-interval` commands reset the global query-interval value to 125 seconds by removing the `ip igmp snooping querier query-interval` statement from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
ip igmp snooping querier query-interval query_sec
no ip igmp snooping querier query-interval
default ip igmp snooping querier query-interval
```

Parameters
- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

Example
- This command sets the global query interval to 150 seconds.

```
switch(config)#ip igmp snooping querier query-interval 150
switch(config)#
```
15.2.8.21 **ip igmp snooping querier startup-query-count**

The `ip igmp snooping querier startup-query-count` command configures the global startup query count value. The startup query count specifies the number of query messages that the querier sends on a VLAN during the startup query interval (ip igmp snooping querier startup-query-interval).

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The startup-query-interval and startup-query-count parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global startup query count value when they are not assigned a value (ip igmp snooping vlan querier startup-query-count). VLAN commands take precedence over the global value. The default global value is specified by the robustness variable (ip igmp snooping robustness-variable).

The `no ip igmp snooping querier startup-query-count` and `default ip igmp snooping querier startup-query-count` commands restore the default startup-query-count value by removing the corresponding `ip igmp snooping querier startup-query-count` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

`ip igmp snooping querier startup-query-count number`

`no ip igmp snooping querier startup-query-count`

`default ip igmp snooping querier startup-query-count`

**Parameters**

- **number** global startup query count. Value ranges from 1 to 3.

**Example**

- These commands configure the global startup query count value of 2, then displays the status of the snooping querier.

```plaintext
switch(config)#ip igmp snooping querier startup-query-count 2
switch(config)#show igmp snooping querier status
  Global IGMP Querier status
  ---------------------------------------------
  admin state                      : Disabled
  source IP address                : 0.0.0.0
  query-interval (sec)             : 125.0
  max-response-time (sec)          : 10.0
  querier timeout (sec)            : 255.0
  last-member-query-interval (sec) : 1.0
  last-member-query-count          : 2 (robustness)
  startup-query-interval (sec)     : 31.25 (query-interval/4)
  startup-query-count              : 2
  Vlan Admin  IP         Query Interval Response Querier Operational Ver
  State        Time     Time     Timeout State
  -------------------------------------
  1  Disabled 0.0.0.0  125.0 10.0 255.0  Non-Querier v2
  100 Disabled 0.0.0.0  125.0 10.0 255.0  Non-Querier v2
  101 Disabled 0.0.0.0  125.0 10.0 255.0  Non-Querier v2
switch(config)#
```

2779
15.2.8.22  ip igmp snooping querier startup-query-interval

The `ip igmp snooping querier startup-query-interval` command configures the global startup query interval value. The startup query interval specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The startup-query-interval and startup-query-count parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs use the global startup query interval value when they are not assigned a value (ip igmp snooping vlan querier startup-query-interval). VLAN commands take precedence over the global value. The default global value equals the query interval divided by four. (ip igmp snooping querier query-interval).

The `no ip igmp snooping querier startup-query-interval` and `default ip igmp snooping querier startup-query-interval` commands restore the default method of specifying the startup query interval by removing the corresponding `ip igmp snooping querier startup-query-interval` command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

`ip igmp snooping querier startup-query-interval period`
`no ip igmp snooping querier startup-query-count`
`default ip igmp snooping querier startup-query-count`

**Parameters**

- `period` startup query interval (seconds). Value ranges from 1 to 3600 (1 hour).

**Example**

- This command configures the startup query count of one minute for VLAN interface 4.

```
switch(config)#ip igmp snooping querier startup-query-interval 40
switch(config)#show igmp snooping querier status
  Global IGMP Querier status
  -------------------------------------------------------
  admin state                      : Enabled
  source IP address                : 0.0.0.0
  query-interval (sec)             : 125.0
  max-response-time (sec)          : 10.0
  querier timeout (sec)            : 255.0
  last-member-query-interval (sec) : 1.0
  last-member-query-count          : 2 (robustness)
  startup-query-interval (sec)     : 40.0
  startup-query-count              : 2
  Vlan Admin    IP              Query    Response Querier Operational Ver
  State                    Interval Time     Timeout State
  -------------------------------------------------------
  1    Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
  100  Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
  101  Enabled  0.0.0.0         125.0    10.0     255.0   Non-Querier v3
switch(config)#
```
15.2.8.23  ip igmp snooping querier version

The ip igmp snooping querier version command configures the Internet Group Management Protocol (IGMP) snooping querier version on the configuration mode interfaces. Version 3 is the default IGMP version.

IGMP is enabled by the pim ipv4 sparse-mode or pim ipv4 bidirectional command. The ig igmp snooping querier version command does not affect the IGMP enabled status.

The no ip igmp snooping querier version and default ip igmp snooping querier version commands restore the configuration mode to IGMP version 3 by removing the ip igmp snooping querier version statement from running-config.

Command Mode
Global Configuration

Command Syntax

ip igmp snooping querier version  version_number
no ip igmp snooping querier startup-query-count
default ip igmp snooping querier startup-query-count

Parameters
• version_number IGMP version number. Value ranges from 1 to 3. Default value is 3.

Example
• This command configures IGMP snooping querier version 2.

switch(config)#ip igmp snooping querier version 2
switch(config)#

• This command restores the IGMP snooping querier to version 3.

switch(config)# no ip igmp snooping querier version
switch(config)#
15.2.8.24  ip igmp snooping querier

The `ip igmp snooping querier` command enables the snooping querier globally, which controls the querier for VLANs that are not configured with a snooping querier command. The `ip igmp snooping vlan querier` command controls the querier on individual VLANs.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The `no ip igmp snooping querier` and `default ip igmp snooping querier` commands disable the snooping querier globally by removing the `ip igmp snooping querier` statement from `running-config`. The snooping querier is globally disabled by default.

Command Mode
Global Configuration

Command Syntax

`ip igmp snooping querier`
`no ip igmp snooping querier`
`default ip igmp snooping querier`

Guidelines

- Enabling a querier after it was disabled is equivalent to establishing a new querier.
- Changing the querier IP address is equivalent to establishing a new querier.

Example

- This command globally enables the snooping querier on the switch.

```
switch(config)#ip igmp snooping querier
switch(config)#
```
15.2.8.25 ip igmp snooping report-flooding switch-port

The ip igmp snooping report-flooding switch-port command specifies Ethernet ports or port channels that can forward IGMP membership report messages for all VLANs where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The ip igmp snooping vlan report-flooding switch-port command configures a list of forwarding ports for a specified VLAN range.

The no ip igmp snooping report-flooding switch-port and default ip igmp snooping report-flooding switch-port commands remove the specified ports from the global report flooding port list by deleting the corresponding ip igmp snooping report-flooding switch-port command from running-config.

Command Mode
Global Configuration

Command Syntax
ip igmp snooping report-flooding switch-port INTERFACE
no ip igmp snooping report-flooding switch-port INTERFACE
default ip igmp snooping report-flooding switch-port INTERFACE

Parameters
• INTERFACE Membership report message forwarding is enabled on these ports:
  • ethernet e_range e_range is the number, range, or list of ethernet ports
  • port-channel p_range where p_range is the number, range, or list of channel ports

Related Commands
• ip igmp snooping report-flooding globally enables L2 report flooding.
• ip igmp snooping vlan report-flooding switch-port specifies a port list for a VLAN range.

Example
• This command configures Ethernet ports 7-9 for report message forwarding for any VLAN where L2 report flooding is enabled.

switch(config)#ip igmp snooping report-flooding switch-port ethernet 7-9
switch(config)#
15.2.8.26 ip igmp snooping report-flooding

The `ip igmp snooping report-flooding` command globally enables L2 report flooding on the switch. When report flooding is globally enabled, the `ip igmp snooping vlan report-flooding` configures a VLAN range to forward membership report messages to specified ports. When report flooding is not globally enabled, L2 report flooding cannot be enabled on individual VLANs.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can result in performance issues. L2 report flooding addresses this by facilitating report message transmissions through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

The `no ip igmp snooping report-flooding` and `default ip igmp snooping report-flooding` commands disable global L2 report flooding by removing `ip igmp report flooding` from `running-config`. L2 report flooding is disabled by default.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping report-flooding`
- `no ip igmp snooping report-flooding`
- `default ip igmp snooping report-flooding`

**Related Commands**

- `ip igmp snooping vlan report-flooding` enables L2 report flooding on a specified VLAN range.

**Example**

- This command globally enables the snooping L2 report-flooding.

```plaintext
switch(config)#ip igmp snooping report-flooding
switch(config)#
```
15.2.8.27  ip igmp snooping restart query-interval

The **ip igmp snooping restart query-interval** command sets the query interval for all VLANs during an IGMP snooping restart. By default, the query interval during an IGMP snooping restart is a VLAN configured query interval divided by five. This accelerates the transmission of robustness queries to establish the IGMP snooping state more quickly. However, some large scale configurations may not be able to process all of the queries at this query interval rate. The restart query interval, when configured, is valid for all VLANs.

The **no ip igmp snooping restart query-interval** and **default ip igmp snooping restart query-interval** commands removes the global restart query interval by deleting the **ip igmp snooping restart query-interval** statement from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping restart query-interval query_sec
no ip igmp snooping restart query-interval
default ip igmp snooping restart query-interval
```

**Parameters**

- `query_sec` query interval (seconds). Values range from 2 to 400. Default (global) is 125.

**Example**

- This command sets the global query interval to 35 seconds.

```
switch(config)#ip igmp snooping restart query-interval 35
switch(config)#
```
**15.2.8.28 ip igmp snooping robustness-variable**

The `ip igmp snooping robustness-variable` command configures the robustness variable for snooping packets sent from any VLAN. Values range from 1 to 3 with a default of 2.

The robustness variable specifies the number of unacknowledged snooping queries that a switch sends before removing the recipient from the group list.

The `no ip igmp snooping robustness-variable` and `default ip igmp snooping robustness-variable` commands reset the robustness variable to 2 by removing the `ip igmp snooping robustness-variable` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping robustness-variable robust_value
no ip igmp snooping robustness-variable
default ip igmp snooping robustness-variable
```

**Parameters**

- `robust_value` robustness variable. Values range from 1 to 3. Default is 2.

**Example**

- This command sets the robustness-variable value to 3.

```
switch(config)#ip igmp snooping robustness-variable 3
switch(config)#
```
15.2.8.29  ip igmp snooping vlan fast-leave

The `ip igmp snooping vlan fast-leave` command enables fast-leave processing on specified VLANs. When fast-leave processing is enabled, the removal of a VLAN interface's multicast group entry from the IGMP table is not preceded by an IGMP group-specific query to the interface. The switch removes an interface from the forwarding table when it detects an IGMP leave message on the interface. IGMP fast-leave processing is enabled on all VLANs by default.

The `no ip igmp snooping vlan fast-leave` command disables fast-leave processing on the specified VLANs. The `default ip igmp snooping vlan fast-leave` command restores fast-leave processing on the specified VLANs by removing the corresponding `no ip igmp snooping vlan fast-leave` statement from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping vlan v_range fast-leave`
- `no ip igmp snooping vlan v_range fast-leave`
- `default ip igmp snooping vlan v_range fast-leave`

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**

- This command enables IGMP fast-leave processing on VLAN 10.

```
switch(config)#ip igmp snooping vlan 10 fast-leave
switch(config)#
```
15.2.8.30  ip igmp snooping vlan max-groups

The *ip igmp snooping vlan max-groups* command configures the quantity of multicast groups that the specified VLAN forwarding table can contain. After the limit is reached, attempts to join new groups are ignored. There is no default limit.

The *no ip igmp snooping vlan max-groups* and *default ip igmp snooping vlan max-groups* removes the maximum group limit by deleting the *ip igmp snooping vlan max-groups* statement from *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
ip igmp snooping vlan v_range max-groups quantity
no ip igmp snooping vlan v_range max-groups
default ip igmp snooping vlan v_range max-groups
```

**Parameters**

- *v_range* VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- *quantity* maximum number of groups that can access the VLAN. Value ranges from 0 to 65534.

**Examples**

- This command limits the number of multicast groups that hosts on VLAN 6 can simultaneously access to 25.

  ```plaintext
  switch(config)#ip igmp snooping vlan 6 max-groups 25
  switch(config)#
  ```

- This command allows each VLAN between 8 and 15 to receive multicast packets from 30 groups.

  ```plaintext
  switch(config)#ip igmp snooping vlan 8-15 max-groups 30
  switch(config)#
  ```

- This command removes the maximum group restriction from all VLAN interfaces between 1 and 50.

  ```plaintext
  switch(config)#no ip igmp snooping vlan 1-50 max-groups
  switch(config)#
  ```
15.2.8.31  ip igmp snooping vlan member

The `ip igmp snooping vlan member` command adds ports as static members to a multicast group. The ports must be in the specified VLAN range.

The `no ip igmp snooping vlan member` and `default ip igmp snooping vlan member` commands remove the specified ports from the multicast group by deleting the corresponding `ip igmp snooping member` statements from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
no ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
default ip igmp snooping vlan v_num member ipv4_addr interface STATIC_INT
```

**Parameters**

- `v_num` VLAN number. Value ranges from 1 to 4094.
- `ipv4_addr` multicast group IPv4 address.
- `STATIC_INT` interface the command configures as the static group member. Options include:
  - `ethernet e_range`, where `e_range` is the number, range, or list of Ethernet ports
  - `port-channel p_range`, where `p_range` is the number, range, or list of channel ports

**Example**

- This command configures the static connection to a multicast group at 237.2.1.4 through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 7 member 237.2.1.4 interface ethernet 3
switch(config)#
```
### 15.2.8.32  ip igmp snooping vlan multicast-router

The `ip igmp snooping vlan multicast-router` command adds a multicast router as a static port to the specified VLANs. The router port must be in the specified VLAN range.

Snooping may not always be able to locate the IGMP querier. This command should specify IGMP queriers that are known to connect to the network through a port on the switch.

The `no ip igmp snooping vlan multicast-router` and `default ip igmp snooping vlan multicast-router` commands remove the specified static port configuration by deleting the corresponding `ip igmp snooping vlan multicast-router` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `ip igmp snooping vlan v_range multicast-router interface STATIC_INT`
- `no ip igmp snooping vlan v_range multicast-router interface STATIC_INT`
- `default ip igmp snooping vlan v_range multicast-router interface STATIC_INT`

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `STATIC_INT` interface the command configures as a static port. Selection options include:
  - `ethernet e_range` where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range` where `p_range` is the number, range, or list of channel ports

The `STATIC_INT` interface must route traffic through a VLAN specified within `v_range`.

**Example**

- This command configures the static connection to a multicast router through Ethernet port 3.

```
switch(config)#ip igmp snooping vlan 2 multicast-router interface ethernet 3
switch(config)#
```
Multicast

15.2.8.33 ip igmp snooping vlan proxy

The `ip igmp snooping vlan proxy` command enables snooping proxy on individual VLAN, and to enable or disable IGMP snooping vlan proxy globally, use `ip igmp snooping proxy` command.

Note: The `ip igmp snooping proxy` command enables snooping proxy on all VLANs only where IGMP snooping is enabled.

The `no` and `default` form of `ip igmp snooping vlan proxy` command disables snooping proxy globally and on individual VLANs by removing the `ip igmp snooping vlan proxy` command from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
ip igmp snooping vlan [ID | range] proxy
no ip igmp snooping vlan [ID | range] proxy
default ip igmp snooping vlan [ID | range] proxy
```

Parameters

- `range` specifies the range of VLAN IDs. Numbers range from 1 to 4094.
- `ID` specifies a individual VLAN ID. Numbers range from 1 to 4094.

Examples

- This command globally enables IGMP snooping proxy on the switch and on all VLANs where IGMP snooping is enabled.

  ```
  switch(config)#ip igmp snooping proxy
  switch(config)#
  ```

- This command enables IGMP snooping proxy on VLAN 20.

  ```
  switch(config)#ip igmp snooping vlan 20 proxy
  switch(config)#
  ```

- This command disables IGMP snooping proxy on VLAN 20.

  ```
  switch(config)#no ip igmp snooping vlan 20 proxy
  switch(config)#
  ```
15.2.8.34  ip igmp snooping vlan querier address

The **ip igmp snooping vlan querier address** command sets the source address for query packets sent from specified VLANs. VLANs not assigned an address use the global address (**ip igmp snooping querier address**). VLAN querier address commands take precedence over the global address.

To use a snooping querier, an address must be explicitly configured globally or for the querier VLAN.

The **no ip igmp vlan snooping querier address** and **default ip igmp snooping vlan querier address** commands reset the specified VLAN to use the global address by removing the corresponding **ip igmp snooping vlan querier address** command from running-config.

**Command Mode**

Global Configuration

**Command Syntax**

`ip igmp snooping vlan v_range querier address ipv4_address`

`no ip igmp snooping vlan v_range querier address`

`default ip igmp snooping vlan v_range querier address`

**Parameters**

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **ipv4_address** source IPv4 address.

**Example**

- This command sets the source IPv4 address of 10.14.1.1 for query packets transmitted from VLAN 2.

  ```
  switch(config)#ip igmp snooping vlan 2 querier address 10.14.1.1
  switch(config)#
  ```
15.2.8.35  ip igmp snooping vlan querier last-member-query-count

The **ip igmp snooping vlan querier last-member-query-count** command specifies an IGMP snooping querier last member query count (LMQC) value for the specified VLANs. LMQC specifies the number of query messages the switch sends in response to group-specific or group-source-specific leave messages it receives from a host; the transmission frequency is specified by **IGMP snooping querier last member query interval**. The switch stops forwarding messages to the host if it does not receive a response to these query messages.

VLANs not assigned an LMQC value use the global value (**ip igmp snooping querier last-member-query-count**). VLAN commands take precedence over the global command.

Setting the last member query count (LMQC) to 1 causes the loss of a single packet to stop traffic forwarding. While the switch can start forwarding traffic again after receiving a response to the next general query, the host may not receive that query for a period defined by **ip igmp snooping querier query-interval**.

The **no ip igmp snooping vlan querier last-member-query-count** and **default ip igmp snooping vlan querier last-member-query-count** commands reset the specified VLAN to use the global LMQC by removing the corresponding **ip igmp snooping vlan querier last-member-query-count** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier last-member-query-count number
no ip igmp snooping vlan v_range querier address
default ip igmp snooping vlan v_range querier address
```

**Parameters**

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **number** query message quantity. Value ranges from 1 to 3.

**Example**

- This command configures the last-member-query-count to 1 on VLAN interface 3.

```
switch(config)#ip igmp snooping vlan 3 querier last-member-query-count 1
switch(config)#
```
15.2.8.36 ip igmp snooping vlan querier last-member-query-interval

The `ip igmp snooping vlan querier last-member-query-interval` command configures the last-member-query-interval for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (`ip igmp snooping querier last-member-query-interval`). VLAN commands take precedence over the global value. The global default is one second.

A multicast host sends an IGMP leave report when it leaves a group. To determine if the host was the last group member, the leave message recipient sends an IGMP query. The last-member-query-interval determines when the group record is deleted if no subsequent reports are received.

The `no ip igmp snooping vlan querier last-member-query-interval` and `default ip igmp snooping vlan querier last-member-query-interval` commands reset the specified VLAN to use the global last-member-query-interval by removing the corresponding `ip igmp snooping vlan querier last-member-query-interval` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**
```
ip igmp snooping vlan v_range querier last-member-query-interval period
no ip igmp snooping vlan v_range querier last-member-query-interval
default ip igmp snooping vlan v_range querier last-member-query-interval
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `period` last member query interval (seconds). Value ranges from 1 to 25.

**Example**
- This command sets the last-member-query-interval for VLAN 10 to 12 seconds.

```
switch(config)#ip igmp snooping vlan 10 querier last-member-query-interval 12
switch(config)#
```
15.2.8.37  ip igmp snooping vlan querier max-response-time

The ip igmp snooping vlan querier max-response-time command configures max-response-time for packets sent from the specified VLANs. VLANs not assigned a value use the global setting (ip igmp snooping querier max-response-time). VLAN commands take precedence over the global value. The global default is 10 seconds.

Switches use max-response-time to set the Max Response Time field in outbound Membership Query messages. Max Response Time specifies the maximum period a recipient can wait before responding with a Membership Report.

The no ip igmp snooping vlan querier max-response-time and default ip igmp snooping vlan querier max-response-time commands reset the specified VLAN to use the global max-response-time by removing the corresponding ip igmp snooping vlan querier max-response-time command from running-config.

Command Mode
Global Configuration

Command Syntax

ip igmp snooping vlan v_range querier max-response-time resp_sec
no ip igmp snooping vlan v_range querier max-response-time
default ip igmp snooping vlan v_range querier max-response-time

Parameters

•  v_range VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
•  resp_sec max-response-time value (seconds). Values range from 1 to 25.

Example

•  This command sets the max-response-time for VLAN 2 to 5 seconds.

    switch(config)#ip igmp snooping vlan 2 querier max-response-time 5
    switch(config)#
15.2.8.38  ip igmp snooping vlan querier query-interval

The `ip igmp snooping vlan querier query-interval` command sets the query interval for the specified VLAN. VLANs not assigned a value use the global value (`ip igmp snooping querier query-interval`). VLAN commands have precedence over the global value. The query interval is the period between IGMP Membership Query messages sent from the querier.

The `no ip igmp snooping vlan querier query-interval` and `default ip igmp snooping vlan querier query-interval` commands reset the specified VLAN to use the global value by removing the corresponding `ip igmp snooping vlan querier query-interval` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier query-interval query_sec
no ip igmp snooping vlan v_range querier query-interval
default ip igmp snooping vlan v_range querier query-interval
```

**Parameters**
- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `query_sec` query interval (seconds). Values range from 5 to 3600. Default (global) is 125.

**Example**
- This command sets the query interval for VLAN 10 to 240 seconds.

```
switch(config)#ip igmp snooping vlan 10 querier query-interval 240
switch(config)#
```
The `ip igmp snooping vlan querier startup-query-count` command specifies the startup query count value for the specified VLANs. The `startup query count` specifies the number of query messages that the querier sends on a VLAN during the `startup query interval`.

When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The startup-query-interval and startup-query-count parameters define the startup period and the query message transmission frequency during that period.

VLANs not assigned a `startup query count` value use the global value (`ip igmp snooping querier startup-query-count`). VLAN commands take precedence over the global command.

The `no ip igmp snooping vlan querier startup-query-count` and `default ip igmp snooping vlan querier startup-query-count` commands restore the default condition of using the global `startup query count` value by removing the corresponding `ip igmp snooping vlan querier startup-query-count` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier startup-query-count number
no ip igmp snooping vlan v_range querier startup-query-count
default ip igmp snooping vlan v_range querier startup-query-count
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `number` startup query count. Value ranges from 1 to 3.

**Example**

- This command configures the startup query count of 3 for VLAN 100.

```
switch(config)#ip igmp snooping vlan 100 querier startup-query-count 3
switch(config)#
```
The **ip igmp snooping vlan querier startup-query-interval** command specifies the **startup query interval** value for the specified VLANs. The **startup query interval** specifies the period between query messages that the querier sends upon startup.

When snooping is enabled, the group state is more quickly established by sending query messages at a higher frequency. The startup-query-interval and startup-query-count parameters define the startup period by defining the number of queries to be sent and transmission frequency for these messages.

VLANs not assigned a **startup query interval** value use the global value (**ip igmp snooping querier startup-query-count**). VLAN commands take precedence over the global command.

The **no ip igmp snooping vlan querier startup-query-interval** and **default ip igmp snooping vlan querier startup-query-interval** commands restore the default condition of using the global **startup query interval** value by removing the corresponding **ip igmp snooping vlan querier startup-query-interval** command from **running-config**.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier startup-query-interval period
no ip igmp snooping vlan v_range querier startup-query-interval
default ip igmp snooping vlan v_range querier startup-query-interval
```

**Parameters**

- **v_range** VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- **period** startup query interval (seconds). Value ranges from 1 to 3600 (1 hour). Default is 31.

**Example**

- This command configures the startup query count of one minute for VLAN interface 100.

```
switch(config)#ip igmp snooping vlan 100 querier startup-query-interval 60
switch(config)#
```
15.2.8.41 ip igmp snooping vlan querier version

The `ip igmp snooping vlan querier version` command configures the Internet Group Management Protocol (IGMP) snooping querier function on the VLAN. Version 3 is the default IGMP snooping version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ig igmp snooping vlan querier version` command does not affect the IGMP enabled status.

The `no ip igmp snooping vlan querier version` and `default ip igmp snooping vlan querier version` commands restore the configuration mode interface to IGMP snooping VLAN querier version 3 by removing the `ip igmp snooping vlan querier version` statement from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range querier version  version_number
no ip igmp snooping vlan v_range querier version
default ip igmp snooping vlan v_range querier version
```

**Parameters**

- `v_range` VLAN ID. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `version_number` IGMP version number. Value ranges from 1 to 3. Default value is 3.

**Example**

- The example sets the querier version to 2 on vlan 5.

```
switch(config)#ip igmp snooping vlan 5 querier version 2
switch(config)#
```

- This command restores IGMP snooping querier version 3 to VLAN 5.

```
switch(config)# no ip igmp snooping vlan 5 querier version
switch(config)#
```
15.2.8.42  ip igmp snooping vlan querier

The `ip igmp snooping vlan querier` command controls the querier for the specified VLANs. VLANs follow the global querier setting unless overridden by one of these commands:

- ip igmp snooping vlan querier enables the querier on specified VLANs.
- no ip igmp snooping vlan querier disables the querier on specified VLANs.

VLAN querier commands take precedence over the global querier setting. The `ip igmp snooping querier` controls the querier for VLANs with no snooping querier command.

The IGMP snooping querier supports snooping by sending layer 2 membership queries to hosts attached to the switch. The snooping querier is functional on VLANs where hosts receive IP multicast traffic without access to a network IP multicast router. A snooping querier avoids flooding multicast packets in the VLAN by querying for hosts and routers.

The IGMP snooping querier is functional on VLANs that meet these criteria:

- Snooping is enabled.
- The corresponding SVI (VLAN interface) is active.
- The VLAN querier IP address or the global querier IP address is configured.

The `default ip igmp snooping vlan querier` command restores the usage of the global setting for the specified VLAN by removing the corresponding `ip igmp snooping vlan querier` or `no ip igmp snooping vlan querier` command from `running-config`.

Command Mode
Global Configuration

Command Syntax

`ip igmp snooping vlan v_range querier`
`no ip igmp snooping vlan v_range querier`
`default ip igmp snooping vlan v_range querier`

Parameters

- `v_range` VLAN IDs. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

Examples

- These commands globally enable the snooping querier on the switch, explicitly disable snooping on VLANs 1-3, and explicitly enable snooping on VLANs 4-6.

```plaintext
switch(config)#ip igmp snooping querier
switch(config)#no ip igmp snooping vlan 1-3 querier
switch(config)#ip igmp snooping vlan 4-6 querier
```

After running these commands, the running-config file contains these lines, which indicate that the snooping querier is enabled on VLANs 4-6.

```plaintext
switch(config)#show running-config

<-------OUTPUT OMITTED FROM EXAMPLE-------->
no ip igmp snooping vlan 1 querier
no ip igmp snooping vlan 2 querier
no ip igmp snooping vlan 3 querier
ip igmp snooping vlan 4 querier
ip igmp snooping vlan 5 querier
ip igmp snooping vlan 6 querier
ip igmp snooping querier
```

2800
• This command removes the querier setting for VLANs 2-5:

```bash
switch(config)#default ip igmp snooping vlan 2-5 querier
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, enabled implicitly on VLANs 3-6, and enabled explicitly on VLANs 7-8, as shown by `running-config`:

```bash
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
-ip igmp snooping querier
```

• This command sets the global snooping querier to disabled by removing the global querier setting from `running-config`:

```bash
switch(config)#no ip igmp snooping querier
switch(config)#
```

When executed after the previous commands, the snooping querier is disabled explicitly on VLANs 1-2, disabled implicitly on VLANs 3-6 and enabled explicitly on VLANs 7-8, as shown by `running-config`.

```bash
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
```

```bash
no ip igmp snooping vlan 1 querier
ip igmp snooping vlan 6 querier
```
ip igmp snooping vlan report-flooding switch-port

The `ip igmp snooping vlan report-flooding switch-port` command configures Ethernet ports or port channels to forward IGMP membership report messages for a specified VLAN range where L2 report flooding is enabled. Ports that are connected to multicast routers or queriers continue to forward traffic as previously specified and are not affected by L2 report flooding commands.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. The `ip igmp snooping report-flooding switch-port` command configures a list of forwarding ports for all VLANs where L2 report flooding is enabled.

The `no ip igmp snooping vlan report-flooding switch-port` and `default ip igmp snooping vlan report-flooding switch-port` commands remove the listed ports from the specified report flooding port list by deleting the corresponding `ip igmp snooping vlan report-flooding switch-port` statements from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
no ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
default ip igmp snooping vlan v_range report-flooding switch-port INTERFACE
```

**Parameters**

- `v_range` VLAN IDs. Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.
- `INTERFACE` Membership report message forwarding is enabled on these ports:
  - `ethernet e_range` where `e_range` is the number, range, or list of ethernet ports
  - `port-channel p_range` where `p_range` is the number, range, or list of channel ports

**Related Commands**

- `ip igmp snooping report-flooding` globally enables L2 report flooding.
- `ip igmp snooping vlan report-flooding switch-port` specifies a port list for a VLAN range.
- `ip igmp snooping report-flooding switch-port` specifies a port list for all VLANs.

**Example**

These commands globally enable L2 report flooding, enable flooding on VLANs 201 through 205, and specify Ethernet ports 8-10 as the report flooding port list for VLANS 201-205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding switch-port ethernet 8-10
```

```
15.2.8.44  ip igmp snooping vlan report-flooding

The `ip igmp snooping vlan report-flooding` command enables L2 report flooding on the specified VLANs if report flooding is globally enabled. When L2 report flooding is not globally enabled, this command has no effect. The `ip igmp snooping report-flooding` command globally enables L2 report flooding.

L2 report flooding is an IGMP snooping feature that forwards membership report messages to specified ports. Relying on a single switch to maintain and send report messages can degrade performance. L2 report flooding addresses this by facilitating report message forwarding through any network port. This allows switches to bypass the querier when forwarding multicast traffic to its interested ports.

Two commands specify the ports that forward reports:
- `ip igmp snooping vlan report-flooding switch-port` for a VLAN range.
- `ip igmp snooping report-flooding switch-port` for all VLANs where report flooding is enabled.

The `no ip igmp snooping vlan report-flooding` and `default ip igmp snooping vlan report-flooding` commands disable L2 report flooding for the specified VLAN by removing the corresponding `ip igmp snooping vlan report-flooding` statement from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
ip igmp snooping vlan v_range report-flooding
no ip igmp snooping vlan v_range report-flooding
default ip igmp snooping vlan v_range report-flooding
```

Parameters
- `v_range` VLAN IDs Formats include a number, number range, or comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

Related Commands
- `ip igmp snooping report-flooding` globally enables L2 report flooding.

Example
- These commands enable L2 report flooding globally and on VLANs 201 through 205.

```
switch(config)#ip igmp snooping report-flooding
switch(config)#ip igmp snooping vlan 201-205 report-flooding
switch(config)#
```
### 15.2.8.45 ip igmp snooping vlan

The `ip igmp snooping vlan` command enables snooping on the specified VLANs if snooping is globally enabled. IGMP snooping is globally enabled by default. The `ip igmp snooping` command enables snooping globally.

Note that if IGMP snooping is enabled, QoS will not apply to IGMP packets.

The `no ip igmp snooping vlan` command disables snooping on the specified VLANs.

The `default ip igmp snooping vlan` command returns the snooping setting for the specified VLANs to enabled by removing the corresponding `ip igmp snooping vlan` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip igmp snooping vlan v_range</code></td>
<td></td>
</tr>
<tr>
<td><code>no ip igmp snooping vlan v_range</code></td>
<td></td>
</tr>
<tr>
<td><code>default ip igmp snooping vlan v_range</code></td>
<td></td>
</tr>
</tbody>
</table>

**Parameters**

- `v_range` VLANs upon which snooping is enabled. Formats include a number, a number range, or a comma-delimited list of numbers and ranges. Numbers range from 1 to 4094.

**Example**

- This command disables snooping on VLANs 2 through 4.

```
switch(config)# no ip igmp snooping vlan 2-4
switch(config)#
```
15.2.8.46 ip igmp snooping

The `ip igmp snooping` command enables snooping globally. By default, global snooping is enabled. When global snooping is enabled, `ip igmp snooping vlan` enables or disables snooping on individual VLANs. When global snooping is disabled, snooping cannot be enabled on individual VLANs.

QoS cannot be used for IGMP packets when IGMP snooping is enabled.

The `no ip igmp snooping` command disables global snooping. The `default ip igmp snooping` command restores the global snooping default setting of enabled by removing the `ip igmp snooping` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
- `ip igmp snooping`
- `no ip igmp snooping`
- `default ip igmp snooping`

Example
- This command globally enables snooping on the switch.

```bash
switch(config)#ip igmp snooping
switch(config)#
```

Multicast
15.2.8.47  ip igmp startup-query-count

The `ip igmp startup-query-count` command specifies the number of query messages that an interface sends during the startup interval defined by `ip igmp startup-query-interval`. When an interface starts running IGMP, it can establish the group state more quickly by sending query messages at a higher frequency. The startup-query-interval and startup-query-count parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-count` and `default ip igmp startup-query-count` commands restore the default startup-query-count value of 2 for the configuration mode interface by removing the corresponding `ip igmp startup-query-count` command from `running-config`.

**Command Mode**
Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

**Command Syntax**

```
ip igmp startup-query-count number
no ip igmp startup-query-count
default ip igmp startup-query-count
```

**Parameters**

- `number` quantity of queries. Values range from 1 to 65535. Default is 2.

**Example**

- This command configures the startup query count of 10 for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-count 10
switch(config-if-Vl4)#
```
15.2.8.48  ip igmp startup-query-interval

The `ip igmp startup-query-interval` command specifies the configuration mode interface IGMP startup period, during which query messages are sent at an accelerated rate.

When an interface starts running IGMP, it can establish the group state quicker by sending query messages at a higher frequency. The startup-query-interval and startup-query-count parameters define the startup period and the query message transmission frequency during that period.

The `no ip igmp startup-query-interval` and `default ip igmp startup-query-interval` commands restore the configuration mode interface default IGMP startup-query-interval of 31 seconds by removing the corresponding `ip igmp startup-query-interval` command from `running-config`.

Command Mode

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

Command Syntax

```
ip igmp startup-query-interval period
no ip igmp startup-query-interval
default ip igmp startup-query-interval```

Parameters

- `period` startup query interval, in deciseconds. Value ranges from 10 (one second) to 317440 (8 hours, 49 minutes, 4 seconds). Default is 31 seconds.

Example

- This command configures the startup query count of one minute for VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp startup-query-interval 600
switch(config-if-Vl4)#
```
15.2.8.49 ip igmp static-group acl

The **ip igmp static-group acl** command configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL). This command is a variant of the **ip igmp static-group** command that uses ACL rules to specify a set of source-multicast group address pairs instead of specifying a single pair. Multiple static-group ACLs can be assigned to an interface. Static groups can be assigned manually and through ACLs simultaneously.

Access control lists that this command references must contain rules of the following format.

- **permit <protocol><source><destination>**, where
  - `<protocol>` has no effect on the static group.
  - `<source>` address of host originating multicast data packets. Must be a host address.
  - `<destination>` multicast group IP address or subnet. Must be a valid multicast address.

An ACL can contain multiple rules. An ACL can be applied to an interface only when all of its rules comply to the specified restrictions. The **show ip igmp static-groups acl** displays the source-multicast group pairs that the specified list configures and lists issues with illegal rules.

The **no ip igmp static-group acl** and **default ip igmp static-group acl** commands remove the specified static group ACL command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

**Command Syntax**

- ip igmp static-group acl *list_name*
- no ip igmp static-group acl
- default ip igmp static-group acl

**Parameters**

- *list_name* ACL that specifies multicast group addresses for which interface fast-switches packets.

**Example**

- This command configures VLAN interface 4 as a static member of the multicast group specified by the ACL named LIST_1.

```bash
switch(config)#interface vlan 4
switch(config-if-VI4)#ip igmp static-group acl LIST_1
switch(config-if-VI4)#
```
15.2.8.50 ip igmp static-group range

The `ip igmp static-group range` command configures the configuration mode interface as a static member of multicast groups specified by an address range. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, no static group memberships are configured on interfaces.

This command is a variant of the `ip igmp static-group` command that allows the assignment of a subnet range of source addresses or a subnet range of multicast groups. A single `ip igmp static-group range` command is the equivalent of multiple `ip igmp static-group` commands, each of which can only assign a single multigroup-source pair to an interface. Running-config converts the range command to the equivalent list of `ip igmp static-group` commands.

If the command includes a source address range, only multicast group messages received from the range are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

The `no ip igmp static-group range` and `default ip igmp static-group range` commands remove the specified range of static group statements from `running-config`. The `no ip igmp static-group` and `default ip igmp static-group` commands can remove an individual static-group command that was initially added to `running-config` by an `ip igmp static-group range` command.

**Command Mode**

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

**Command Syntax**

`ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]`

`no ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]`

`default ip igmp static-group range GROUP_ADDR[SOURCE_ADDR]`

**Parameters**

- `GROUP_ADDR` address of multicast group for which the interface fast-switches packets.
- `SOURCE_ADDR` IP address of a host range that originates multicast data packets.
- `<no parameter>` all multicast messages of the specified range are fast-switched.
- `source sr_ipv4_address` source IPv4 address (dotted decimal notation).
- `source sr_ipv4_subnet` IPv4 subnet address of source hosts (CIDR or address-mask).

**Note:** A command cannot specify a subnet address for both multicast group and source.

**Examples**

- This command configures VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at 10.1.1.1.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#ip igmp static-group range 239.1.4.1/24 source 10.1.1.1
switch(config-if-Vl4)#
```
This command attempts to configure VLAN interface 4 as a static member of the multicast group range 241.1.4.1/24 for data packets that originate at the 10.1.1.1/29 subnet. Because the range and source cannot both be subnets, this command generates an error message.

```
switch(config-if-Vl4)#ip igmp static-group range 239.1.1.1/29 source 16.1.1.1/29
% Error: cannot specify source range with group range
switch(config-if-Vl4)#
```
15.2.8.51  **ip igmp static-group**

The **ip igmp static-group** command configures the configuration mode interface as a static member of a specified multicast group. This allows the router to forward multicast group packets through the interface without otherwise appearing or acting as a group member. By default, static group memberships are not configured on any interfaces.

If the command includes a source address, only multicast group messages received from the specified host address are fast-switched. Otherwise, all multicast messages of the specified group are fast-switched.

**Note:** To become a static member of a multicast group, the switch must be the PIM designated router (DR) for the network. If it is not, you can use the **pim ipv4 dr-priority** command to make it the DR by configuring its PIM DR value to be the highest on the network.

The **no ip igmp static-group** and **default ip igmp static-group** commands remove the configuration mode interface group membership by removing the corresponding **ip igmp static-group** command from **running-config**.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

**Command Syntax**

```
ip igmp static-group group_address [SOURCE_ADDRESS]
no ip igmp static-group group_address [SOURCE_ADDRESS]
default ip igmp static-group group_address [SOURCE_ADDRESS]
```

**Parameters**

- **group_address** IPv4 address of multicast group for which the interface fast-switches packets.
- **SOURCE_ADDRESS** IP address of host that originates multicast data packets.
  
  - **<no parameter>** all multicast messages of the specified group are fast-switched.
  - **ipv4_address** source IP address (dotted decimal notation).

**Related Commands**

- **ip igmp static-group acl** configures the configuration mode interface as a static member of the multicast groups specified by an IP access control list (ACL).
- **ip igmp static-group range** configures the configuration mode interface as a static member of multicast groups specified by an address range.

  One **ip igmp static-group range** command is equivalent to multiple **ip igmp static-group** commands.

**Example**

- These commands configure VLAN interface 15 as the PIM designated router, then configure it as a static member of the multicast group at address 231.1.1.15 for multicast data packets that originate at 10.1.1.1.

```bash
switch(config)#interface vlan 15
switch(config-if-Vl15)#pim ipv4 dr-priority 5000
switch(config-if-Vl15)#ip igmp static-group 231.1.1.45 10.1.1.1
switch(config-if-Vl15)#
```
15.2.8.52  ip igmp version

The `ip igmp version` command configures the Internet Group Management Protocol (IGMP) version on the configuration mode interface. Version 3 is the default IGMP version.

IGMP is enabled by the `pim ipv4 sparse-mode` or `pim ipv4 bidirectional` command. The `ig igmp version` command does not affect the IGMP enabled status.

The `no ip igmp version` and `default ip igmp version` commands restore the configuration mode interface to IGMP version 3 by removing the `ip igmp version` statement from `running-config`.

Command Mode

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

Command Syntax

`ip igmp version version_number`

`no ip igmp version`

`default ip igmp version`

Parameters

- `version_number` IGMP version number. Value ranges from 1 to 3.

Example

- This command configures IGMP version 3 on VLAN interface 4.

  ```
  switch(config)#interface vlan 4
  switch(config-if-Vl4)#ip igmp version 3
  switch(config-if-Vl4)#
  ```
The `ip igmp` command enables IGMP on a routed interface or on SVI (VLAN interface) without enabling PIM.

The `no ip igmp` command removes the corresponding `ip igmp` command from `running-config`.

**Command Mode**

Interface Configuration

**Command Syntax**

- `ip igmp`
- `no ip igmp`

**Example**

- This command enables IGMP on Ethernet interface 5/2.

```bash
switch(config)#interface ethernet 5/2
switch(config-if-Et5/2)#ip igmp
switch(config-if-Et5/2)#
```
15.2.8.54  permit / deny

The **permit** command configures the configuration mode IGMP profile as a permit list. Applying a permit list to an interface restricts that interface from joining any multicast group not included in the list.

IGMP profiles are deny lists by default. When applied to an interface, a deny list allows the interface to join any multicast group that is not included in the list.

The **deny** command restores the IGMP list to its default type by removing the corresponding **permit** statement from **running-config**.

The **range** command adds and removes address ranges from the configuration mode profile.

**Command Mode**

IGMP-profile Configuration

**Command Syntax**

- permit
- deny

**Related Commands**

- **ip igmp profile** places the switch in IGMP-profile configuration mode.

**Example**

- These commands enter IGMP profile configuration mode and configure the profile as a permit list.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#
```
15.2.8.55 range

The range command specifies an address range for the configuration mode IGMP profile. A permit range specifies the groups that an interface is permitted to join. A deny range specifies the groups that an interface is not permitted to join. The permit / deny command specifies the range type.

A profile may contain multiple range statements to define a discontiguous address range.

The no range and default range commands remove the specified address range from a previous specified list.

Command Mode
IGMP-profile Configuration

Command Syntax
range init_address [UPPER_RANGE]
no range init_address [UPPER_RANGE]
default range init_address [UPPER_RANGE]

Parameters

- init_address IP address of lower boundary of the address range (dotted decimal notation).
- UPPER_RANGE sets the upper boundary of the address range. Options include
  - <no parameter> upper boundary is equal to lower boundary: range consists of one address.
  - range_address IP address of upper boundary.

All addresses must be multicast addresses (10.0.0.0 to 239.255.255.255).

Related Commands

- ip igmp profile places the switch in IGMP-profile configuration mode.

Example

- These commands enter IGMP profile configuration mode, configure the profile as a permit list, and define the permit address list of 232.1.1.0 to 232.1.1.255 and 233.1.1.10.

```
switch(config)#ip igmp profile list_1
switch(config-igmp-profile-list_1)#permit
switch(config-igmp-profile-list_1)#232.1.1.0 232.1.1.255
switch(config-igmp-profile-list_1)#233.1.1.10
switch(config-igmp-profile-list_1)#ip igmp profile
```
15.2.8.56  show igmp snooping querier counters

The show igmp snooping querier counters command displays the counters from the querier, as learned through Internet Group Management Protocol (IGMP).

Command Mode
EXEC

Command Syntax
show igmp snooping querier counters [ VLAN_ID]

Parameters
• VLAN_ID specifies VLANs for which command displays information. Options include:
  • <no parameter> displays information for all VLANs.
  • vlan v_num displays information for specified VLAN.

Example
• This command displays the counters from the querier.

```
switch>show igmp snooping querier counters
-----------------------------------------------------------------------

Other Packets                   :0
switch>
```
show igmp snooping querier membership

The `show igmp snooping querier membership` command displays the membership from the querier, as learned through Internet Group Management Protocol (IGMP).

**Command Mode**

EXEC

**Command Syntax**

`show igmp snooping querier membership [VLAN_ID [GROUP_LIST]]`

**Parameters**

- VLAN_ID specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.
- GROUP_LIST list of groups for which the command displays information. Options include:
  - `<no parameter>` all multicast groups within specified VLAN.
  - `group ipv4_addr` single multicast group address (dotted decimal notation).

**Example**

- This command displays the membership from the querier fro VLAN 1.

```
switch>show igmp snooping querier membership
----------
Vlan: 1    Elected: 10.0.0.1       QQI: 125  QRV: 2  QRI: 10  GMI: 260
Groups     Mode  Ver  Num of Sources
----------
10.0.0.2    EX    v3   0    []
10.0.0.3    IN    v3   2    [ 3.3.3.3, 3.3.3.4 ]
10.0.0.4    EX    v3   0    []
10.0.0.13   EX    v3   0    []
10.0.0.22   EX    v3   0    []
10.0.0.1    IN    v3   3    [ 5.6.7.9, 5.6.7.8, ... ]
switch>
```
The `show igmp snooping querier` command displays snooping querier configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show igmp snooping querier [STATUS] [VLAN_ID] [DATA]
```

**Parameters**

- STATUS specifies the type of information displayed. Options include:
  - `<no parameter>` querier IP address, port, and IGMP version.
  - `status` querier configuration parameters.
- VLAN_ID specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- DATA specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.

**Example**

- This command displays the querier IP address, version, and port servicing each VLAN.

  ```
  switch>show igmp snooping querier
  Vlan  IP Address       Version  Port
  ----------------------------------------
  1     172.17.0.37      v2       Po1
  20    172.17.20.1      v2       Po1
  26    172.17.26.1      v2       Cpu
  2028  172.17.255.29    v2       Po1
  switch>
  ```

- This command displays the querier configuration parameters for each VLAN.

  ```
  switch>show igmp snooping querier status

  ```
**15.2.8.59**  show ip igmp groups count

The **show ip igmp groups count** command displays the number of multicast groups that are joined across the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp groups [GROUP_LIST] count`

**Parameters**

- **INTERF** Specifies the interface for which the command displays information. Options include:
  - `<no parameter>` all IGMP interfaces.
  - `interface ethernet e_num` Ethernet interface.
  - `interface loopback l_num` Loopback interface.
  - `interface management m_num` Management interface.
  - `interface port-channel p_num` Port-Channel Interface.
  - `interface vlan v_num` VLAN interface.
  - `interface vxlan vx_num` VXLAN interface.

**Example**

- This command displays the number of multicast groups joined across all interfaces.
  
  ```
  switch>show ip igmp groups count
  Number of total groups joined across all IGMP interfaces: 5
  switch>
  ```

- This command displays the number of multicast groups joined on Ethernet 3/4 interface.
  
  ```
  switch>show ip igmp groups interface ethernet 3/4 count
  Number of groups joined on Ethernet3/4: 2
  switch>
  ```
show ip igmp groups

The `show ip igmp groups` command displays multicast groups that have receivers directly connected to the switch, as learned through Internet Group Management Protocol (IGMP).

- `show ip igmp groups` all multicast groups.
- `show ip igmp groups group_addr` listed multicast group.
- `show ip igmp groups interface int_name` all multicast groups on specified interfaces.
- `show ip igmp groups group_addr interface int_name` listed multicast group on specified interface.

**Command Mode**
EXEC

**Command Syntax**

`show ip igmp groups GROUP_LIST [DATA]`

**Parameters**

- `GROUP_LIST` list of groups for which the command displays information. Options include:
  - `<no parameter>` all multicast groups.
  - `group_addr` single multicast group address (dotted decimal notation).
  - `interface ethernet e_num` all multicast groups on specified Ethernet interface.
  - `interface loopback l_num` all multicast groups on specified Loopback interface.
  - `interface management m_num` all multicast groups on specified Management interface.
  - `interface port-channel p_num` all multicast groups on specified Port-Channel Interface.
  - `interface vlan v_num` all multicast groups on specified VLAN interface.
  - `interface vxlan vx_num` all multicast groups on specified VXLAN interface.

- `DATA` specifies the type of information displayed. Options include:
  - `<no parameter>` provides uptime, expiration, and address of reporter.
  - `detail` also include group mode and group source list.

**Example**

- This command displays multicast groups with receivers directly connected to the switch.

```
switch>show ip igmp groups
NOTE: static-group information not shown below. Use the
'show ip igmp static-groups' command.
IGMP Connected Group Membership

```
15.2.8.61  show ip igmp host-proxy config-sanity

The `show ip igmp host-proxy config-sanity` command displays diagnostic information about an IGMP host proxy configuration.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp host-proxy config-sanity`

**Example**

- This command displays IGMP host proxy configuration diagnostic information.

```
switch>show ip igmp host-proxy config-sanity
Below are hints of potential IGMP Host-Proxy misconfigurations
IGMP host-proxy configured on interface Test3:
Access-lists having "deny ip any any" rule:
  acl1
  acl2
Groups with overlapping permit and deny configurations:
  192.168.1.1/32
  192.168.2.2/32
  192.168.4.4/32
Groups with source filters configured with IGMP Host-Proxy set to version 2 :
  192.168.2.2/32
  192.168.3.0/24
  192.168.3.3/32
  192.168.8.8/32
switch>
```
15.2.8.62 show ip igmp host-proxy interface

The `show ip igmp host-proxy interface` command displays per-interface IGMP host-proxy configuration information, including the IGMP groups joined on the interface. Command filters allow the list to display only data for a specified interface and to include packet counter statistics in the display.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp host-proxy interface [interface] [detail]`

**Parameters**

- `interface` optional parameter to limit the display to a single interface. Omitting the parameter displays host-proxy configuration information for all interfaces on which IGMP host-proxy is configured. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` port-channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
- `detail` use this optional keyword to include packet counter statistics in the display.

**Examples**

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured.

```
switch>show ip igmp host-proxy interface
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface Group Address IncludeSrc ExcludeSrc
  Test2  172.16.89.0
  Test2  172.16.0.0  20.0.0.0
  Test2  172.16.0.0  10.0.0.0
  Test2 192.168.110.0  20.0.0.0
```

- This command displays host-proxy information for all switch interfaces on which IGMP host-proxy is configured, plus host-proxy statistics.

```
switch>show ip igmp host-proxy interface detail
IGMP host-proxy configured on: Test2
IGMP host-proxy version: 3
Unsolicited-report interval: 1.0
Device name: Test2
Interface Group Address IncludeSrc ExcludeSrc
  Test2  172.16.89.0
  Test2  172.16.0.0  20.0.0.0
  Test2  172.16.0.0  10.0.0.0
  Test2 192.168.110.0  20.0.0.0
IGMP host-proxy statistics:
  IGMP v1 Queries received: 0
  IGMP v2 General-Queries received: 0
  IGMP v2 Group-Queries received: 0
  IGMP v3 General-Queries received: 0
  IGMP v3 Group-Queries received: 0
  IGMP v3 Group-Source Queries received: 0
  IGMP v1 Reports sent: 0
  IGMP v2 Reports sent: 0
  IGMP v3 Reports sent: 1
```
15.2.8.63 show ip igmp interface

The `show ip igmp interface` command displays multicast information about the specified interface.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp interface [INT_NAME]
```

**Parameters**

- INT_NAME Interface type and number. Values include
  - `<no parameter>` Displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Example**

- This command displays multicast related information about VLAN 26.

  switch> `show ip igmp interface vlan 26`

  Vlan26 is up
  Interface address: 172.17.26.1/23
  IGMP on this interface: enabled
  Multicast routing on this interface: enabled
  Multicast TTL threshold: 1
  Current IGMP router version: 2
  IGMP query interval: 125 seconds
  IGMP max query response time: 100 deciseconds
  Last member query response interval: 10 deciseconds
  Last member query response count: 2
  IGMP querier: 172.17.26.1
  Robustness: 2
  Require router alert: enabled
  Startup query interval: 312 deciseconds
  Startup query count: 2
  General query timer expiry: 00:00:22
  Multicast groups joined:
  239.255.255.250

  switch>
show ip igmp profile

The `show ip igmp profile` command displays the contents of the specified IGMP profile. IGMP snooping filters use an IGMP profile to control the multicast groups that an interface can join.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp profile [PROFILES]`

**Parameters**

- PROFILES IGMP profiles for which command displays contents. Options include:
  - `<no parameter>` displays all IGMP profiles.
  - `profile_name` displays specified profile.

**Example**

- This command displays the IGMP profiles configured on the switch.

```
switch>show ip igmp profile
IGMP Profile list_1
   permit
   range 229.1.24.0 229.1.25.255
IGMP Profile list_2
   deny
   range 234.1.1.0 234.1.255.255
switch>
```
**15.2.8.65  show ip igmp snooping counters ethdev-pams**

The `show ip igmp snooping counters ethdev-pams` command displays the number of dropped IGMP packets messages sent and received through each switch port at the kernel level. The display table sorts the messages by type.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp snooping counters ethdev-pams`

**Example**

- This command displays the number of messages dropped at the kernel level.

```plaintext
switch>show ip igmp snooping counters ethdev-pams

```
15.2.8.66 show ip igmp snooping counters

The `show ip igmp snooping counters` command displays the number of IGMP messages sent and received through each switch port. The display table sorts the messages by type.

Command Mode
EXEC

Command Syntax
`show ip igmp snooping counters [DATA_TYPE][DATA_LEVEL]`

Parameters
- **DATA_TYPE** Information displayed by the command. Options include:
  - `<no parameter>` displays transmission counters.
  - `errors` displays error counters.
- **DATA_LEVEL** specifies the type of information displayed. Options include:
  - `<no parameter>` number of packets on physical ports.
  - `detail` number of packets on physical ports.

Example
- This command displays the number of messages received on each port.

show ip igmp snooping groups count

The `show ip igmp snooping groups count` command displays the number of multicast groups on the switch. Command provides options to only include specific VLANs and ports.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp snooping groups [VLAN_ID][PORT_INT] count [DATA]`

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - `<no parameter>` all physical ports.
  - `interface ethernet e_range` specified Ethernet ports.
  - `interface port-channel p_range` specified port channels.

Valid `e_range` and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` number of multicast group on specified VLAN and ports.
  - `detail` number of multicast group on specified VLAN and ports.

**Example**

- This command displays the number of multicast groups on the switch.

```
switch>show ip igmp snooping groups count
Total number of multicast groups: 2
switch>
```
show ip igmp snooping groups

The `show ip igmp snooping groups` command displays IGMP snooping statistics. Available information includes the physical ports that send and receive information, the time when multicast data was originally and most recently heard on the ports, and the version number of the IGMP messages. Command provides options that restrict the output to specific VLANs, ports, and groups.

**Command Mode**

EXEC

**Command Syntax**

`show ip igmp snooping groups` [proxy [VLAN_ID][PORT_INT][GROUPS][DATA]]

**Parameters**

- **VLAN_ID** specifies VLAN for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for VLAN `v_num` (1 to 4094).
- **PORT_INT** specifies physical ports for which command displays information. Options include:
  - `<no parameter>` displays information for all physical ports.
  - `interface ethernet e_range`, where `e_range` is the number, range, or list of Ethernet ports.
  - `interface port-channel p_range`, where `p_range` is the number, range, or list of channel ports.
- **GROUPS** specifies the multicast groups. Options include:
  - `<no parameter>` all multicast groups on all specified ports.
  - `mgroup_address` multicast group specified by IPv4 address (dotted decimal notation).
  - `dynamic` multicast groups learned through IGMP.
  - `user` multicast groups manually added.
- **DATA** specifies the type of information displayed. Options include:
  - `<no parameter>` VLAN number and port-list for each group.
  - `detail` port-specific information for each group, including transmission times and expiration.
  - `proxy` displays IGMP snooping proxy information.

**Examples**

- This command displays the port lists for all multicast groups.

  switch>show ip igmp snooping groups

10       Ethernet4     225.2.2.2                      Exclude 190.171.60.6
10       Ethernet4     225.3.3.3                      Exclude 150.227.112.250
```
15.2.8.69  **show ip igmp snooping mrouter**

The **show ip igmp snooping mrouter** command displays the status of dynamic and static multicast router ports. Command provides options to include only specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping mrouter [VLAN_ID] [DATA]
```

**Parameters**

- VLAN_ID specifies VLAN for which command displays information. Options include:
  - <no parameter> all VLANs.
  - **vlan** v_num specified VLAN.
- DATA specifies the type of information displayed. Options include:
  - <no parameter> displays VLAN number and port-list for each group.
  - **detail** displays port-specific data for each group; includes transmission times and expiration.

**Examples**

- This command displays port information of each multicast router on all VLANs.

```
switch>show ip igmp snooping mrouter
Vlan   Interface-ports
----------------------------------------------
1      Po1(dynamic)
20     Po1(dynamic)
26     Cpu(dynamic)
2028   Cpu(dynamic), Po1(dynamic)
switch>
```

- This command displays multicast router information for each port.

```
switch>show ip igmp snooping mrouter detail

switch>
```
The `show ip igmp snooping report-flooding` command displays IGMP snooping L2 report flooding configuration and status information. Command provides options to only include specific VLANs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip igmp snooping report-flooding [VLAN_ID][DATA]
```

**Parameters**

- VLAN_ID specifies VLANs for which command displays information. Options include:
  - `<no parameter>` all VLANs.
  - `vlan v_num` specified VLAN.
- DATA specifies the type of information displayed. Options include:
  - `<no parameter>` displays VLAN number and port-list for each group.
  - `detail` displays port-specific data for each group; includes transmission times and expiration.
15.2.8.71 show ip igmp snooping

The `show ip igmp snooping` command displays the switch IGMP snooping configuration.

**Command Mode**
EXEC

**Command Syntax**
`show ip igmp snooping [VLAN_ID]`

**Parameters**
- VLAN_ID specifies VLANs for which command displays information. Options include:
  - `<no parameter>` displays information for all VLANs.
  - `vlan v_num` displays information for specified VLAN.

**Example**
- This command displays the switch IGMP snooping configuration.

```
switch>show ip igmp snooping
  Global IGMP Snooping configuration:
  -------------------------------------------
  IGMP snooping                  : Enabled
  Robustness variable            : 2

Vlan 1 :
  --------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

Vlan 20 :
  --------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

Vlan 26 :
  --------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

Vlan 2028 :
  --------
  IGMP snooping                  : Enabled
  Multicast router learning mode : pim-dvmrp

switch>
```
The `show ip igmp static-groups acl` command displays information about the IGMP multicast static groups that are configured by the specified access control list (ACL). The command also displays problems with an ACL that prevent its assignment to an interface.

**Command Mode**
EXEC

**Command Syntax**

```
show ip igmp static-groups acl
```

**Example**

- The following `show ip igmp static-group acl` command example references these ACLs:

  ```
ip access-list 1
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp host 10.1.1.2 10.1.1.0/29

  ip access-list 2
  10 permit igmp 10.1.1.0/29 host 10.1.1.1

  ip access-list 3
  10 deny igmp host 10.1.1.1 255.1.1.0/29

  ip access-list 4
  10 permit igmp host 10.1.1.1 10.1.1.0/29
  20 permit igmp 10.1.1.0/29 host 10.1.1.1
```

- This command displays static group configuration data about the various ACLs.

  ```
  switch>show ip igmp static-group acl 1
  acl 1
  ( 10.1.1.1, 10.1.1.0/29 )
  ( 10.1.1.2, 10.1.1.0/29 )
  Interfaces using this ACL for static groups:
  Ethernet12
  switch>show ip igmp static-group acl 2
  acl 2
  Seq no 30: source address must be a single host or *, not a range
  Interfaces using this ACL for static groups:
  Ethernet8
  switch>show ip igmp static-group acl 3
  acl 4
  Seq no 10: action must be 'permit'
  Interfaces using this ACL for static groups:
  none
  switch>show ip igmp static-group acl 4
  acl 5
  ( 10.1.1.1, 10.1.1.0/29 )
  Seq no 20: source address must be a single host or *, not a range
  Interfaces using this ACL for static groups:
  none
  switch>
```
The `show ip igmp static-groups group` command displays information about all specified IGMP multicast static groups. IGMP multicast static groups are assigned with the `ip igmp static-group` command.

**Command Mode**
EXEC

**Command Syntax**
```
show ip igmp static-groups group [GROUP_LIST]
```

**Parameters**
- GROUP LIST Groups for which command displays information
  - `<no parameter>` all multicast groups.
  - `group_address` single multicast group address (dotted decimal notation).

**Related Commands**
- `show ip igmp static-groups`
show ip igmp static-groups

The `show ip igmp static-groups` command displays information about all configured IGMP multicast static groups. IGMP multicast static groups are assigned with the `ip igmp static-group` command.

**Command Mode**
EXEC

**Command Syntax**
`show ip igmp static-groups [INFO_LEVEL] [interface INT_NAME]`

**Parameters**
- **INFO_LEVEL** specifies the type of information displayed. Options include
  - <no parameter> VLAN number and port-list for each group.
  - **detail** port-specific information for each group, including transmission times and expiration.
- **INT_NAME** Interface type and number. Values include
  - <no parameter> static groups on all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

**Related Commands**
- `show ip igmp static-groups acl`
- `show ip igmp static-groups group`

**Examples**
- This command displays information about all multicast static groups.

```
switch>show ip igmp static-groups
Interface Vlan281:
    Manually configured groups:
Interface Port-Channel1999:
    Manually configured groups:
switch>
```

- This command displays information about the multicast static groups on VLAN interface 21.

```
switch>show ip igmp static-groups interface vlan 21
Interface Vlan281:
    Manually configured groups:
switch>
```
15.2.8.75 show ip igmp statistics

The `show ip igmp statistics` command displays IGMP transmission statistics for the specified interface.

Command Mode
EXEC

Command Syntax
`show ip igmp statistics [INTERFACE_ID]`

Parameters
- INTERFACE_ID Specifies interface for which command returns data. Options include:
  - `<no parameter>` all interfaces.
  - `interface ethernet e_num` Ethernet interface specified by e_num.
  - `interface loopback l_num` Loopback interface specified by l_num.
  - `interface management m_num` Management interface specified by m_num.
  - `interface port-channel p_num` Port-Channel Interface specified by p_num.
  - `interface vlan v_num` VLAN interface specified by v_num.
  - `interface vxlan vx_num` VXLAN interface specified by vx_num.

Example
- This command displays IGMP transmission statistics for ethernet 1 interface.

```
switch>show ip igmp statistics interface ethernet 1
IGMP counters for Ethernet1:
  V1 queries sent: 0
  V2 queries sent: 0
  V3 queries sent: 3
  Total general queries sent: 3
  V3 group specific queries sent: 0
  V3 group-source specific queries sent: 0
  V1 queries received: 0
  V2 queries received: 0
  V3 queries received: 0
  V1 reports received: 0
  V2 reports received: 0
  V3 reports received: 14
  V2 leaves received: 0
  Error Packets received: 0
  Other Packets received: 0
switch>
```

15.3 Protocol Independent Multicast

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. Arista switches support two types of PIM: PIM Sparse Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

These sections describe the Arista PIM implementation:
- Introduction
- Overview
- Configuring PIM
- Multicast Example
- PIM Commands
15.3.1 Introduction

Protocol Independent Multicast (PIM) distributes multicast data using routes gathered by other protocols. PIM Sparse Mode (PIM-SM), defined in RFC 4601, is a multicast routing protocol intended for networks where multicast group recipients are sparsely distributed, including wide-area and inter-domain networks. Bidirectional PIM (Bidir-PIM), defined in RFC 5015, is a variant of PIM-SM designed for cases in which the receivers of multicast traffic are also sources and where scalability could affect optimization.

Arista switches support both PIM Sparse-Mode (PIM-SM) and Bidirectional PIM (Bidir-PIM).

15.3.2 Overview

PIM builds and maintains multicast routing trees using reverse path forwarding (RPF) on a unicast routing table. PIM is protocol-independent, and can use routing tables consisting of OSPF, BGP, RIP, and static routes. All sources send traffic to multicast groups through shared trees that have a common root node called the rendezvous point (RP).

PIM uses a multicast routing information base (MRIB) that is populated from the unicast table. The MRIB provides the next-hop router for each multicast destination subnet. This determines the next-hop neighbor for sending PIM join or prune messages.

15.3.2.1 PIM Sparse Mode

In PIM-SM, each host (sender or receiver) is associated with a designated router (DR) that acts for all directly connected hosts in PIM-SM transactions, and trees are unidirectional. Once sufficient traffic is flowing on a route it usually does not pass through the RP.

PIM-SM establishes multicast routes through three phases:

- Establishing the RP Tree
- Eliminating Encapsulation
- Establishing the Shortest Path Tree (SPT)

15.3.2.1.1 Establishing the RP Tree (Phase 1)

The RP tree is a distribution network that all sources share to deliver multicast data. The root of the RP tree is the Rendezvous Point.

The process starts when a receiver requests multicast data from a group (G). The receiver's DR sends a PIM (*,G) Join message toward the multicast group's RP. As the message travels towards the RP, it instantiates the multicast (*,G) state in each router on the path. Join messages converge on the RP to form the RP tree.

The DR resends Join messages periodically, while it has a receiver in the group, to prevent state timeout expiry in the routers along the path. When all receivers on a DRs subnet leave a group, the DR sends a (*,G) Prune message towards the RP to remove the state from the routers.

A multicast sender transmits multicast data to the RP through its DR. The DR encapsulates the multicast packets and sends them as unicast packets. The RP extracts the native multicast packet and sends it to the RP tree towards the group members.

15.3.2.1.2 Eliminating Multicast Encapsulation (Phase 2)

Data encapsulation, while initially required before the multicast path is established, is inefficient because it requires the transmission of data that is extraneous to multicast. Phase 2 establishes states in the routers that support the transmission of native multicast packets.

When the RP receives an encapsulated packet from source S on group G, it sends an (S,G) join message toward the source. As the message travels towards S, it instantiates the (S,G) state on each
router in the path which is used to forward packets from source S destined for group G. Data packets on the (S,G) path are also routed into the RP tree when they encounter an (*,G) router.

When the RP starts receiving native packets from the sources, it sends a Register-Stop message to the sources DR, halting packet encapsulation. At this time, traffic flows natively from the source along a source-specific tree to the RP, then along the shared RP tree to the receivers.

15.3.2.1.3 Establishing the Shortest Path Tree (Phase 3)

The third phase establishes the shortest path from the multicast source to all receivers.

When a multicast packet arrives at the receiver, its router (typically the DR) sends a Join message towards the source to instantiate the (S,G) state in all routers along its path. The message eventually reaches either the sources subnet or a router that already has an (S,G) state. This causes data to flow from the source to the receiver following the (S,G) path. At this time, the receiver is receiving data from the shortest path tree (SPT) and the RP tree (RPT).

The DR (or upstream router) eliminates the data transmission along the RPT by sending a prune message (S,G,rpt) towards the RP. The message instantiates the state on each router in the path, continuing until it reaches the RP or a router that needs traffic from the same source for other receivers.

15.3.2.2 Bidirectional PIM

Bidirectional PIM (Bidir-PIM) builds shared trees, rooted at the rendezvous point (RP), for each multicast group. Because the trees are based only on (*,G) routes, they can accommodate a much larger number of sources without overfilling the MFIB.

In Bidir-PIM, there is no multicast encapsulation or SPT establishment. All packets are natively forwarded toward the RP along shared, bidirectional trees. There are also no designated routers. Instead, a single designated forwarder (DF) is elected on each link to each RP, usually during the RP discovery process. The DF is the router with the shortest route to the RP based on the unicast routing table. It is responsible for forwarding upstream traffic toward the RP and forwarding downstream traffic toward the groups on its link. All routes pass through the RP, and multicast packets are sent from sources toward the RP and to receivers at each hop along the route.

Bidir-PIM elects DFs when a new RP is discovered, when the DF fails, or when there is a change that affects the topology of the link.

15.3.2.3 Rendezvous Points (RP)

In PIM-SM, an RP is a router that is configured as the root of multicast groups distribution tree. These distribution trees are not source-specific. The RP is the destination for both join messages from receivers and data from senders, allowing receivers discover sender identity and begin receiving group traffic. In PIM-SM, paths through RP routers are temporary; when traffic volume reaches a sufficient level, the receiver joins a source-specific tree and the path through the RP is dropped. In Bidir-PIM, all paths pass through the RP, and all packets destined for a given multicast group are forwarded to the RP for that group.

RP addresses in Bidir-PIM must be routable from all sources in the domain, but do not have to correspond to any specific physical interface. Multiple groups can use the same RP for distribution.

The switch supports two methods of mapping RPs to multicast groups:

- Static: RPs are statically configured through a CLI statement.
- Dynamic: RPs are dynamically selected by a bootstrap router from a set of candidate RPs.

While dynamic RP mappings have priority over static maps by default, a static RP can be configured to override dynamic mappings.

Rendezvous Points (RPs) describes the configuration of rendezvous points.
15.3.3 Configuring PIM

This section describes the following configuration tasks:

- Enabling PIM IPv4 Sparse Mode
- Enabling PIM IPv6 Sparse Mode
- Enabling the S, G Expiry Timer Interval
- Enabling PIM Bidirectional
- Rendezvous Points (RPs)
- Hello Messages
- Hello Hold Time
- Designated Router Election
- Designated Forwarder Election
- Join-Prune Messages
- Legacy PIM Configuration in Global Configuration Mode
- Configuring PIM in a Non-default VRF

15.3.3.1 Enabling PIM IPv4 Sparse Mode

By default, IPv4 PIM is disabled on an interface. The `pim ipv4 sparse-mode` command enables PIM IPv4 Sparse Mode (PIM-SM) on the configuration mode interface. Enabling PIM on an interface enables IGMP on the interface as well.

**Example**

This command enables IPv4 PIM-SM and IGMP on VLAN interface 8.

```
switch(config)#interface vlan 8
switch(config-if-Vl8)#pim ipv4 sparse-mode
switch(config-if-Vl8)#
```

15.3.3.2 Enabling PIM IPv6 Sparse Mode

By default, IPv6 PIM is disabled on an interface. The `pim ipv6 sparse-mode` command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

**Example**

This command enables IPv6 PIM-SM on Ethernet interface 15.

```
switch(config)#interface ethernet 15
switch(config-if-Et15)#pim ipv6 sparse-mode
switch(config-if-Et15)#
```

15.3.3.3 Enabling the S, G Expiry Timer Interval

The `sg-expiry-timer` command enables expiry timer interval for the PIM-SM multicast routes. By default, the `sg-expiry-timer` command applies to the default VRF when the command is issued in the Router-Multicast Configuration mode. During the time of interval, there is no multicast traffic activity on the route.
Example
This command configures 150 seconds as the (S,G) expiry timer interval in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#
```

15.3.3.4 Enabling PIM Bidirectional
By default, PIM is disabled on an interface. The `pim ipv4 bidirectional` command enables Bidirectional PIM (Bidir-PIM) on the configuration mode interface. Enabling PIM on an interface also enables IGMP on that interface.

Example
These commands enable Bidir-PIM and IGMP on VLAN interface 9.

```
switch(config)#interface vlan 9
switch(config-if-Vl9)#pim ipv4 bidirectional
```

15.3.3.5 Rendezvous Points (RPs)
The switch supports dynamic RPs, static RPs, and anycast RPs.

Configuring Static RPs
The `rp address` command configures a static RP, providing an option to override dynamic RPs.

Examples
- This command creates a static RP at 10.17.255.83 in the default VRF that maps to all multicast groups (224/4) and overrides dynamic RPs.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.83 override
```

- This command creates a static RP at 10.21.18.23 in the default VRF that maps to the multicast groups at 238.1.12.0/24.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.21.18.23 238.1.12.0/24
```

Configuring Dynamic RPs
Dynamic RP selection is implemented through a bootstrap router (BSR), which is a PIM router within the PIM domain that selects RPs from a list of candidates. A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.
The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. Holdtime is designated by the BSR router and communicated to other routers through BSMs.

Another subset of domain PIM routers are configured as candidate RPs (C-RPs). The BSR creates a set of qualifying RPs from the list of C-RPs, then distributes the group-to RP mapping set to all domain routers through BSMs. Each PIM router, after receiving this set, uses a standard algorithm defined in RFC 6226 to select one RP per multicast group.

The candidate command configures the switch as a candidate BSR router (C-BSR). Command parameters specify the switch's BSR address, the interval between BSM transmissions, and the switch's BSR priority rating. Priority ratings range from 0 to 255 with a default of 64. Higher numbers denote higher priority during BSR elections.

Example

These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192
    interval 30
switch(config-router-pim-bsr-ipv4)#
```

The holdtime command specifies the value the switch inserts in the holdtime field of bootstrap messages (BSMs) that it sends. This value becomes the holdtime for the PIM domain if the switch is elected as the BSR.

Example

These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#holdtime 75
switch(config-router-pim-bsr-ipv4)#
```

The rp candidate command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast groups dynamic RP set from the list of C-RPs. Command parameters specify the switch's RP address, C-RP advertisement interval, and priority rating. The priority rating is used by the BSR when selecting RPs. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

Running-config may contain multiple rp candidate statements to support multiple multicast groups:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from running-config.
- Running-config stores the interval setting in a separate statement that applies to all rp candidate statements. Commands that specify an interval that differs from the previously configured value place the new value in running-config. This new value applies to all rp candidate statements.
Example

These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in the default VRF.

```bash
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
```

By default, the switch transmits bootstrap router messages (BSMs) over all PIM-enabled interfaces. The `pim bsr ipv4 border` command prevents the switch from transmitting BSMs over the configuration mode interface.

Example

This command prevents the switch from sending BSMs from VLAN interface 10.

```bash
switch(config)#interface vlan 10
switch(config-if-Vl10)#pim bsr ipv4 border
switch(config-if-Vl10)#
```

Anycast Rendezvous Points

A PIM anycast rendezvous point (anycast RP) defines a single RP address that exists on multiple devices. An anycast-RP set consists of the routers configured with the same anycast-RP address. An anycast RP provides redundancy protection and load balancing. The anycast-RP set supports all multicast groups.

The `anycast-rp` command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

Example

These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```bash
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14 register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14 register-count 15
```

15.3.3.6 Hello Messages

PIM-SM multicast routers send PIM router query messages (hello messages) to elect a designated router (DR) for each subnet. The DR then sends registration messages to the RP.

The `pim ipv4 hello interval` command specifies the transmission interval between PIM hello messages originating from the specified VLAN interface.
**Example**

This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 hello interval 45
switch(config-if-Vl4)#
```

### 15.3.3.7 Hello Hold Time

A PIM interface maintains a hold timer for each of its neighbors. The timer is reset whenever a hello message is received from the neighbor. When the timer expires, the neighbor is considered DOWN. The PIM interface can advertise its neighbor to use a higher hold time by modifying the hello interval, or by setting a higher hello count using the `pim ipv4 hello count` command. The hello count specifies how many hello messages can be missed before the neighbor is considered down; the hold time is therefore the hello interval multiplied by the hello count.

#### Examples

- This command configures the PIM hold time on VLAN 2925 to 225 seconds (7.5 times the 30-second hello interval).

```
switch(config)#interface vlan2925
switch(config-if-Vl2925)#pim ipv4 hello count 7.5
```

- This command displays the hold time on VLAN 2925.

```
switch#show ip pim interface vlan2925 details
    Interface Vlan2925 address is 1.0.1.1
    Vif number is 0
    PIM: enabled
    PIM version: 2, mode: sparse
    PIM neighbor count: 0
    PIM Effective DR: 1.0.1.1 (this system)
    PIM Effective DR Priority: 1
    PIM Effective Propagation Delay: 500 milliseconds
    PIM Effective Override Interval: 2500 milliseconds
    PIM Effective Tracking Support: disabled
    PIM Hello Interval: 30 seconds
    PIM Hello Hold Time: 225 seconds <====== New Hold Time ( = 7.5 * 30 )
    PIM Hello Priority: 1 seconds
    PIM Hello Lan Delay: 500 milliseconds
    PIM Assert Override Interval: 3 seconds
switch#
```

### 15.3.3.8 Designated Router Election

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The `group-expiry-timer` command sets the DR priority value that the switch advertises. If `running-config` does not contain a `pim ipv4 dr-priority` statement, the switch does not advertise a DR priority value.
Examples

- This command configures a DR priority value of 15 on VLAN interface 4.

```
switch(config-if-Vl4)#pim ipv4 dr-priority 15
switch(config-if-Vl4)#
```

- This command removes the DR priority from VLAN interface 4.

```
switch(config-if-Vl4)#no pim ipv4 dr-priority
switch(config-if-Vl4)#
```

15.3.3.9 Designated Forwarder Election

Designated forwarders (DFs) are elected based on route metrics in the unicast routing table; there are no configuration options that affect the selection of DFs.

15.3.3.10 Join-Prune Messages

Join/prune messages are sent by the PIM-SM designated router (DR) or the Bidir-PIM designated forwarder (DF) toward the rendezvous point (RP). These messages inform other PIM routers about clients that want to become receivers (join) or stop being receivers (prune) for the groups.

The `pim ipv4 join-prune interval` command specifies the period between join/prune messages that the switch originates from the specified VLAN interface and sends to the upstream RPF neighbor.

Example

This command configures 75 second intervals between join/prune messages originating from VLAN interface 4.

```
switch(config-if-Vl4)#pim ipv4 join-prune interval 75
switch(config-if-Vl4)#
```

15.3.3.11 Legacy PIM Configuration in Global Configuration Mode

Earlier versions of the EOS managed all non-interface-specific PIM configuration from Global Configuration Mode. Legacy configurations retain these global commands in `running-config` after upgrading to a newer version of the EOS, and the configurations are applied unchanged to the default VRF. PIM configuration commands entered in Global Configuration Mode which can be applied to either PIM-SM or Bidir-PIM will be applied to PIM-SM. If any commands are added to `running-config` using the new configuration modes, all legacy commands will be converted to the new modal commands and applied in the default VRF.

Note: Multicast configuration commands issued in Global Configuration Mode are now deprecated, and Arista recommends configuring all multicast parameters in the appropriate configuration mode (i.e., Router-Multicast Configuration, Router-PIM Sparse-mode Configuration, Router-PIM Bidirectional Configuration, Router-PIM BSR Configuration, or Router-MSDP Configuration).

15.3.3.12 Configuring PIM in a Non-default VRF

For PIM to function in a non-default VRF, the VRF must be created and configured for multicast traffic, and routed ports must be added to the VRF. Once this is accomplished, configure VRF-global PIM parameters by using the `vrf` command within a PIM configuration mode to place the switch in a PIM VRF configuration submode.
Interface-specific PIM parameters are configured in the interface-configuration mode for VRF-member interface.

Legacy multicast routing commands issued in Global Configuration Mode are applied to the default VRF, but are now deprecated and are available only for backward compatibility. If any PIM commands are issued in the new format, all legacy commands remaining in `running-config` will be replaced with their updated equivalents and applied to the default VRF.

### 15.3.3.12.1 Preparing the VRF for PIM Configuration

The following steps prepare a non-default VRF to use PIM:

1. Enable unicast routing in the default VRF.
   ```
   switch(config)#ip routing vrf default
   ```

2. Create the non-default VRF if not already created.
   ```
   switch(config)#vrf instance purple
   ```

3. Enable enable unicast routing on the new VRF.
   ```
   switch(config-vrf-purple)#exit
   switch(config)#ip routing vrf purple
   ```

4. Add participating routed ports to the new VRF.
   ```
   switch(config)#interface ethernet 9/2-9/4
   switch(config-if-Et9/2-4)#no switchport
   switch(config-if-Et9/2-4)#vrf purple
   switch(config-if-Et9/2-4)#exit
   ```

5. Enable multicast routing on the new VRF.
   ```
   switch(config)#router multicast
   switch(config-router-multicast)#vrf purple
   switch(config-router-multicast-vrf-purple)#ip multicast routing
   ```

### 15.3.3.12.2 Configuring Global PIM Parameters in a Non-default VRF

Global PIM parameters for non-default VRFs are configured in the VRF submode of the appropriate PIM configuration mode.

**Example**

These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24, with a priority of 48 and a RP advertisement interval of 45 seconds, in VRF purple.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#vrf purple
switch(config-router-pim-sparse-vrf-purple)#ipv4
switch(config-router-pim-sparse-vrf-purple-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-vrf-purple-ipv4)#
```

### 15.3.3.12.3 Configuring Interface-specific PIM Parameters in a Non-default VRF

Interface-specific PIM parameters for member interfaces of a non-default VRF are configured just as they are for the default VRF: in the interface-configuration mode for the interface.
15.3.4 Multicast Example
This section provides an example network that implements multicast (PIM-SM) in the default VRF and includes the required commands.

15.3.4.1 Diagram

Figure 64: Multicast Example displays the multicast network example. The network contains four routers. Multicast routing (PIM-SM) is enabled on two switches. One switch has its IGMP Snooping Querier enabled.

![Multicast Example Diagram]

Figure 64: Multicast Example

The example multicast network implements these multicast parameters:

**Rendezvous Point Address: 10.25.10.15**

**Switch Clara**
- IGMP Snooping: disabled
- Subnet Summary:
  - 10.40.10.0/24: VLAN 11
  - 10.15.10.0/24: VLAN 12
  - 10.15.11.0/24: VLAN 13
  - 10.15.12.0/24: VLAN 14
  - 10.5.1.0/20: VLAN 10

**Switch Mateo**
- IGMP Snooping: disabled
- Subnet Summary:
  - 10.20.13.0/24: VLAN 18
  - 10.20.10.0/24: VLAN 15
  - 10.20.11.0/24: VLAN 16
• 10.20.12.0/24: VLAN 17
• 10.15.10.0/24: VLAN 12
• 10.15.11.0/24: VLAN 13
• 10.15.12.0/24: VLAN 14
• 10.25.10.12/30: VLAN 19
• 10.5.1.0/20: VLAN 10

Switch Allie
• IGMP Snooping: enabled
• Multicast Routing: enabled
• Querier: enabled
• Rendezvous Point Address: 10.25.10.15
• MFIB activity polling interval: 5 second
• Subnet Summary:
  • 10.30.13.0/24: VLAN 23
  • 10.30.10.0/24: VLAN 20 PIM-SM enabled
  • 10.30.11.0/24: VLAN 21 PIM-SM enabled
  • 10.30.12.0/24: VLAN 22
  • 10.25.10.12/30: VLAN 19
  • 10.35.10.0/30: VLAN 24 PIM-SM enabled
  • 10.5.1.0/20: VLAN 10 PIM-SM enabled

Switch Francis
• IGMP Snooping: enabled
• Multicast Routing: enabled
• Subnet Summary:
  • 10.40.10.0/24: VLAN 25 PIM-SM enabled
  • 10.35.10.0/30: VLAN 24 PIM-SM enabled
  • 10.5.1.0/20: VLAN 10

15.3.4.2 Example
This example configures PIM-SM.

1. Configure the interface addresses
   a. Router Clara interfaces
   
   ```
   Clara(config)#interface vlan 11
   Clara(config-if-vl11)#ip address 10.40.10.1/24
   Clara(config-if-vl11)#interface vlan 12
   Clara(config-if-vl12)#ip address 10.15.10.42/24
   Clara(config-if-vl12)#interface vlan 13
   Clara(config-if-vl13)#ip address 10.15.11.21/24
   Clara(config-if-vl13)#interface vlan 14
   Clara(config-if-vl14)#ip address 10.15.12.50/24
   Clara(config-if-vl14)#interface vlan 10
   Clara(config-if-vl10)#ip address 10.5.1.33/20
   Clara(config-if-vl10)#router ospf 1
   Clara(config-router-ospf)#redistribute static
   ```
b. Router Mateo interfaces

Mateo(config)#interface vlan 18
Mateo(config-if-vl18)#ip address 10.20.13.1/24
Mateo(config-if-vl18)#interface vlan 15
Mateo(config-if-vl15)#ip address 10.20.10.1/24

- show ip pim rp-candidate
- show ip pim rp-hash

Multicast
• show ip pim upstream joins
15.3.5.1  anycast-rp

The **anycast-rp** command configures the switch as a member of an anycast-RP set and establishes a communication link with another member of the set.

When the command is issued in Router-Multicast IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF IPv4 Configuration Mode.

The **no anycast-rp** and **default anycast-rp** commands remove the corresponding **anycast-rp** command from **running-config**. When the **no** and **default** commands do not include a peer address, all commands for the specified RP address are removed.

**Command Mode**

Router-Multicast IPv4 Configuration

Router-Multicast VRF IPv4 Configuration

**Command Syntax**

```
anycast-rp  rp_addr  peer_addr  [REGISTER]
no anycast-rp  rp_addr[peer_addr]
default anycast-rp  rp_addr[peer_addr]
```

**Parameters**

- **rp_addr**  Rendezvous point IP address (dotted decimal notation).
- **peer_addr**  IP address of another anycast-RP set member (dotted decimal notation). Note, the peer-addr for a local anycast RP must be a /32 address configured under a loopback interface. To enable anycast RP on the router, each RP requires one local peer address. Use the command to verify the configured local and remote peers.
- **REGISTER**  Number of unacknowledged register messages the switch sends to the peer router.
  - **<no parameter>**  register count is set to default value of 10.
  - **register-count r_num**  where **r_num** is an integer that ranges from 1 to 4294967295.
  - **register-count infinity**

**Example**

These commands configure a switch (IP address 10.1.1.14) into an anycast-RP set with an RP address of 10.17.255.2 in the default VRF. The anycast-RP set contains three other routers, located at 10.1.2.14, 10.1.3.14, and 10.1.4.14. It sets the number of unacknowledged register messages it sends to each router at 15.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.1.14
  register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.2.14
  register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.3.14
  register-count 15
switch(config-router-pim-sparse-ipv4)#anycast-rp 10.17.255.2 10.1.4.14
  register-count 15
switch(config-router-pim-sparse-ipv4)#
```
15.3.5.2 candidate

The candidate command configures the switch as a candidate BSR router (C-BSR). A BSR is a PIM router within the PIM domain through which dynamic RP selection is implemented. The BSR selects RPs from a list of candidate RPs and exchange bootstrap messages (BSM) with all routers in the domain. The BSR is elected from one of the C-BSRs through an exchange of BSMs.

A subset of PIM routers within the domain are configured as candidate bootstrap routers (C-BSRs). Through the exchange of bootstrap messages (BSMs), the C-BSRs elect the BSR, which then uses BSMs to inform all domain routers of its status.

Command parameters specify the switch's BSR address, the interval between BSM transmissions, the length of the hash mask, and the priority assigned to the switch when electing a BSR.

Entering an candidate command replaces any previously configured candidate command. If the new command does not specify a priority, hash mask length, or interval, the previously configured values persist in running-config.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The no candidate and default candidate commands remove the corresponding candidate commands from running-config. The no and default commands restore the priority, hash mask length, and interval parameters to their default values.

Command Mode
Router-PIM BSR IPv4 Configuration
Router-PIM BSR VRF IPv4 Configuration

Command Syntax

candidate INTERFACE [HASHMASK_LENGTH][INTERVAL_PERIOD][PRIORITY_NUM]

no candidate [priority][interval]
default candidate[priority][interval]

Parameters

- INTERFACE Switch uses IP address of specified interface as its BSR address. Options include:
  - ethernet e_num Ethernet interface specified by e_num.
  - loopback l_num Loopback interface specified by l_num.
  - management m_num Management interface specified by m_num.
  - port-channel p_num Port-Channel Interface specified by p_num.
  - vlan v_num VLAN interface specified by v_num.
- HASHMASK_LENGTH Length (in bits) of the hash mask.
  - <no parameter> hash mask remains unchanged from previous setting.
  - hashmask <0 - 32> hash mask length (in bits). Default value is 30.
- INTERVAL_PERIOD Period between the transmission of BSMs (seconds). Default value is 60.
  - <no parameter> interval remains unchanged from previous setting.
  - interval <10 - 536870906> transmission interval in seconds.
- PRIORITY_NUM BSR election priority rating. Larger numbers denote higher priority. Default value is 64.
  - <no parameter> priority remains unchanged from previous setting.
  - priority <0 - 255> priority rating.

Example
These commands configure the switch as a BSR candidate in the default VRF, using the IP address assigned to VLAN interface 24 as its BSR address. The BSM transmission interval is set to 30 seconds and the priority is set to 192.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#candidate vlan 24 priority 192 interval 30
switch(config-router-pim-bsr-ipv4)#
```
15.3.5.3 fast-reroute

The `fast-reroute` command enables Multicast only Fast Re-Route (MoFRR) to minimize traffic loss in a network when a link or node failure occurs. Traffic loss is minimized by allowing the traffic to flow from the secondary path upon the failure of the primary path.

The `no fast-reroute` and `default fast-reroute` commands disable MoFRR by removing the corresponding fast-reroute command from `running-config`.

**Command Mode**

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

**Command Syntax**

```
fast-reroute acl_name
no fast-reroute acl_name
default fast-reroute acl_name
```

**Parameters**

`acl_name` standard access list name.

**Examples**

- These commands enable fast reroute for ACL acl2 in the default VRF under the IPv4 configuration.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#fast-reroute acl2
switch(config-router-pim-sparse-ipv4)#
```

- These commands enable fast reroute for ACL acl2 in VRF red under the IPv4 configuration.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#vrf red
switch(config-router-pim-sparse-vrf-red)#ipv4
switch(config-router-pim-sparse-vrf-red-ipv4)#fast-reroute acl2
switch(config-router-pim-sparse-vrf-red-ipv4)#
```
15.3.5.4  group-expiry-timer

The **group-expiry-timer** command sets the group-expiry-timer in seconds after which a group with no activity gets deleted from the PIM rendezvous point (RP) tree.

When the command is configured in Global Configuration Mode, the configuration is applied globally on the switch. To apply the configuration only in Bidir-PIM mode, the command is configured in Router-PIM Bidirectional Configuration Mode. To apply the configuration for a specific VRF, the command is configured in the VRF sub-mode of the Router-PIM Bidirectional Configuration Mode. Use the `pim ipv4 bidirectional` command to enter Router-PIM Bidirectional Configuration Mode.

The `no group-expiry-timer` and `default group-expiry-timer` applies the system default configuration and removes the corresponding `group-expiry-timer` command from `running-config`.

**Command Mode**

Router-PIM Bidirectional IPv4 Configuration
Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**

```
group-expiry-timer value
no group-expiry-timer value
default group-expiry-timer value
```

**Parameter**

`value` specifies the time in seconds after which a group with no activity expires from the PIM RP. Values range from 1 to 210. There is no default value.

**Examples**

- This command configures PIM expiry-timer of 40 seconds in PIM-bidirectional sub-mode.

  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#group-expiry-timer 40
  ```

- This command configures PIM expiry-timer of 120 seconds for VRF v1.

  ```
  switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#vrf v1
  switch(config-router-pim-bidir-vrf-v1)#ipv4
  switch(config-router-pim-bidir-vrf-v1-ipv4)#group-expiry-timer 120
  ```
15.3.5.5 holdtime

The `holdtime` command specifies the value the switch inserts in the `holdtime` parameter field in bootstrap messages (BSM) that it sends. The BSR holdtime defines the timeout period that an elected BSR remains valid after the receipt of a BSM and is also used in dynamic RP configuration. BSR holdtime is designated by the BSR router and communicated to other routers through BSMs.

When the command is issued in Router-PIM BSR IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM BSR VRF IPv4 Configuration Mode for the appropriate VRF.

The `no holdtime` and `default holdtime` commands restore the default holdtime parameter field insertion value of 130 seconds by removing the `holdtime` statement from `running-config`.

**Command Mode**

- Router-PIM BSR IPv4 Configuration
- Router-PIM BSR VRF IPv4 Configuration

**Command Syntax**

```
holdtime <period>
no holdtime
default holdtime
```

**Parameters**

`period` BSR holdtime (seconds). Value ranges from 12 to 1073741823 (1.073 billion seconds, approximately 34 years). Default is 130.

**Example**

These commands specify 75 seconds as the value that the switch inserts into BSM holdtime fields in the default VRF.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#holdtime 75
```

2860
15.3.5.6 ip pim dr-notify-delay

The `ip pim dr-notify-delay` command configures the designated routers (DR) notification delay time. The command is more effective when all PIM routers on the LAN segment have PIM DR priority that is greater than 1.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The `no ip pim dr-notify-delay` command removes the previously configured DR notification delay time.

**Command Mode**
- Global Configuration
- Router-Multicast VRF Configuration

**Command Syntax**
```plaintext
ip pim dr-notify-delay notify_delay_time
no ip pim dr-notify-delay
```

**Parameters**

`notify_delay_time` The PIM-designated router notify delay time in seconds. The value ranges from -32767 to 32768.

**Guidelines**

The notification delay time is configured with a positive or negative value. The timer influences DR election timing when a router with the highest DR priority on a LAN segment is reloaded. In an MLAG configuration, the notification delay time begins shortly after the MLAG reload delay expires (before which the PIM hello messages are sent with a priority of 1). In a non-MLAG configuration, the notification delay time begins as soon as the PIM is configured first on the interface.

Positive values for notify delay time cause the device to send PIM hello messages with a priority of 1 until the time the notify delay time expires. During this time, DR responsibilities of the device will continue according to configured DR priority. Negative values configured for the notification delay time will not modify the priority sent in PIM hello messages, but the device will not perform any DR responsibility until the notify delay time expires. Positive values are used to avoid loss of multicast packets, but they may create a few duplicate packets from multiple PIM routers forwarding traffic for the same S,G. Negative values are used to avoid duplicate packets, but they may cause packet loss when there are no PIM routers forwarding traffic for an S,G.

**Example**

These commands configure a DR notification delay time of 2 seconds.

```plaintext
switch(config)#router multicast
switch(config-router-multicast)#ip pim dr-notify-delay 2
switch(config-router-multicast)#
```
15.3.5.7 ipv4

The `ipv4` command places the switch in the IPv4 submode for the PIM configuration mode in which it is entered.

**Command Mode**

Router Multicast Configuration

Router-PIM Bidirectional Configuration

Router-PIM BSR Configuration

Router-PIM Sparse-mode Configuration

**Command Syntax**

```
ipv4
```

**Examples**

- These commands place the switch in Router Multicast IPv4 Configuration Mode.
  ```
switch(config)#router multicast
  switch(config-router-multicast)#ipv4
  switch(config-router-multicast-ipv4)#
  ```

- These commands place the switch in Router-PIM Bidirectional IPv4 Configuration Mode.
  ```
switch(config)#router pim bidirectional
  switch(config-router-pim-bidir)#ipv4
  switch(config-router-pim-bidir-ipv4)#
  ```

- These commands place the switch in Router-PIM BSR IPv4 Configuration Mode.
  ```
switch(config)#router pim bsr
  switch(config-router-pim-bsr)#ipv4
  switch(config-router-pim-bsr-ipv4)#
  ```

- These commands place the switch in Router-PIM Sparse-mode IPv4 Configuration Mode.
  ```
switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#
  ```
15.3.5.8 log neighbors

The log neighbors command configures the switch to generate a log message when a neighbor entry is added or removed from the PIM Neighbor table. This function is enabled by default.

The no log neighbors command disables log message generation based on changes to the PIM Neighbor table; this command is stored in the running-config. The log neighbors and default log neighbors commands restore the default setting of generating log messages by deleting the no log neighbors statement from running-config.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration
Router-PIM Sparse-mode VRF IPv4 Configuration
Router-PIM Bidirectional IPv4 Configuration
Router-PIM Bidirectional VRF IPv4 Configuration

Command Syntax

log neighbors
no log neighbors
default log neighbors

Examples

• These commands configure the switch to stop generating log messages based on PIM Neighbor table changes in the default VRF.

<table>
<thead>
<tr>
<th>Command Sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)#router pim sparse-mode</td>
</tr>
<tr>
<td>switch(config-router-pim-sparse)#ipv4</td>
</tr>
<tr>
<td>switch(config-router-pim-sparse-ipv4)#no log neighbors</td>
</tr>
<tr>
<td>switch(config-router-pim-sparse-ipv4)#</td>
</tr>
</tbody>
</table>

• These commands configure the switch to generate log messages when a neighbor entry is added or removed from the PIM Neighbor table in the default VRF.

<table>
<thead>
<tr>
<th>Command Sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)#router pim sparse-mode</td>
</tr>
<tr>
<td>switch(config-router-pim-sparse)#ipv4</td>
</tr>
<tr>
<td>switch(config-router-pim-sparse-ipv4)#log neighbors</td>
</tr>
<tr>
<td>switch(config-router-pim-sparse-ipv4)#</td>
</tr>
</tbody>
</table>
15.3.5.9  pim bsr ipv4 border

The `pim bsr ipv4 border` command prevents the switch from sending bootstrap router messages (BSMs) over the configuration mode interface. By default, BSMs are transmitted over all PIM-enabled interfaces.

The `no pim bsr ipv4 border` and `default pim bsr ipv4 border` commands restore the transmission of BSMs over the configuration mode interface by removing the corresponding `pim bsr ipv4 border` statement from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

**Command Syntax**

`pim bsr ipv4 border`

`no pim bsr ipv4 border`

`default pim bsr ipv4 border`

**Example**

This command prevents the switch from sending BSMs from VLAN interface 10.

```
switch(config)#interface vlan 10
switch(config-if-Vl10)#pim bsr ipv4 border
switch(config-if-Vl10)#
```
15.3.5.10  pim ipv4 bidirectional

The `pim ipv4 bidirectional` command enables PIM bidirectional and IGMP (router mode) on the
configuration mode interface.

▶️ Note: PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the
interface is configured as an MBR, do not enable PIM on the interface.

The `no pim ipv4 bidirectional`, `no pim ipv4`, `default pim ipv4 bidirectional`, and
`default pim ipv4` commands restore the default PIM and IGMP (router mode) settings of disabled
on the configuration mode interface by removing the `pim ipv4 bidirectional` statement from
running-config.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv4 bidirectional`
- `no pim ipv4`
- `no pim ipv4 bidirectional`
- `default pim ipv4`
- `default pim ipv4 bidirectional`

**Example**

This command enables PIM bidirectional on VLAN 4 interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 bidirectional
switch(config-if-Vl4)#
```
The `pim ipv4 border-router` command configures the configuration mode interface as a PIM multicast border router (MBR). A PIM MBR interface allows multicast traffic from sources that are outside of the PIM domain.

This command does not control the transmission or reception of PIM protocol packets by the interface.

Sources learned through an MBR interface are treated as local sources (directly connected to the switch). The border-bit is set in all PIM register messages sent for these sources.

**Note:** Configuration as an MBR and configuration in PIM sparse mode must be mutually exclusive. Ensure that PIM sparse mode is not configured by issuing the `pim ipv4 sparse-mode` command on the interface before issuing this command.

The `no pim ipv4 border-router` and `default pim ipv4 border-router` commands removes the PIM MBR configuration for the configuration mode interface by removing the corresponding `pim ipv4 border-router` statement from `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv4 border-router`
- `no pim ipv4 border-router`
- `default pim ipv4 border-router`

**Example**

These commands configure VLAN interface 200 as a PIM MBR, then display its status.

```plaintext
switch(config)#interface vlan 200
switch(config-if-VL200)#ip address 10.44.2.1/24
switch(config-if-VL200)#no pim ipv4 sparse-mode
switch(config-if-VL200)#pim ipv4 border-router
switch(config-if-VL200)#show active
interface Vlan200
ip address 10.44.2.1/24
pim ipv4 border-router
switch(config-if-VL200)#exit
switch(config)#show ip pim interface
AddressInterfaceModeNeighborHello DRDR
CountIntvl Pri
10.44.2.1Vlan200mbr030110.44.2.100
switch(config)#
```
15.3.5.12  pim ipv4 dr-priority

PIM-SM uses these criteria for electing a designated router (DR):

- If at least one router does not advertise a DR priority value, then PIM-SM elects the router with the highest IP address as the DR.
- If all routers advertise a DR priority value, then PIM-SM elects the router with the highest DR priority value as the DR.

The `pim ipv4 dr-priority` command sets the DR priority value that the configuration mode interface advertises. By default, the interface does not advertise a DR priority value.

The `no pim ipv4 dr-priority` and `default pim ipv4 dr-priority` commands force the use of IP addresses to elect the designated router by removing the corresponding `pim ipv4 dr-priority` statement from `running-config`.

**Command Mode**

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

**Command Syntax**

```plaintext
pim ipv4 dr-priority level
no pim ipv4 dr-priority [level]
default pim ipv4 dr-priority [level]
```

**Parameters**

`level` DR selection priority rating. Value ranges from 0 to 4294967295.

**Examples**

- This command configures the dr-priority value of 15 on VLAN interface 4.

```plaintext
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 dr-priority 15
switch(config-if-Vl4)#
```

- This command force the use of IP addresses to elect the designated router.

```plaintext
switch(config-if-Vl4)#no pim ipv4 dr-priority
switch(config-if-Vl4)#
```
15.3.5.13  pim ipv4 hello count

The **pim ipv4 hello count** command sets the PIM hello count for the interface being configured. PIM hold time is calculated by multiplying the configured hello interval by the hello count, ensuring that the PIM neighbor stays up for the specified time after which the neighbor expires.

The **no pim ipv4 hello count** command removes the corresponding **pim ipv4 hello count** command from *running-config*.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 hello count[\texttt{multiple}]
no pim ipv4 hello count[\texttt{multiple}]
```

**Parameters**

*\texttt{multiple}* hello count multiplier. Value ranges from 1.5 to 65535. The hello hold time is the configured hello interval multiplied by the hello count.

**Examples**

- This command configures a hold time interval of 225 seconds on VLAN interface 2925 by multiplying the default 30-second hello interval by a hello count of 7.5.

  ```
  switch(config)#interface vlan2925
  switch(config-if-Vl2925)#pim ipv4 hello count 7.5
  switch(config-if-Vl2925)#
  ```

- This show command displays the hold time and other configuration details on VLAN 2925.

  ```
  switch#show ip pim interface vlan2925 details
  Interface Vlan2925 address is 1.0.1.1
  Vif number is 0
  PIM: enabled
  PIM version: 2, mode: sparse

  PIM Effective Override Interval: 2500 milliseconds
  PIM Effective Tracking Support: disabled
  PIM Hello Interval: 30 seconds
  PIM Hello Hold Time: 225 seconds <==== New Hold Time (= 7.5 * 30)
  PIM Hello Priority: 1 seconds
  PIM Hello Lan Delay: 500 milliseconds
  PIM Assert Override Interval: 3 seconds
  mrtr1#
  ```
15.3.5.14  pim ipv4 hello interval

The `pim ipv4 hello interval` command specifies the transmission interval between PIM hello messages originating from the configuration mode interface.

The `no pim ipv4 hello interval` and `default pim ipv4 hello interval` commands restore the default query interval of 30 seconds for the configuration mode interface by removing the corresponding `pim ipv4 hello interval` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port-Channel Configuration

Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 hello interval period
no pim ipv4 hello interval [period]
default pim ipv4 hello interval [period]
```

**Parameters**

`period` query interval (seconds). Value ranges from 1 to 1000000 (1 million). Default is 30.

**Example**

This command configures 45 second intervals between hello messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 hello interval 45
switch(config-if-Vl4)#
```
15.3.5.15  pim ipv4 join-prune count

The `pim ipv4 join-prune count` command configures the number of times a join or prune messages can be missed before the upstream neighbor time expires.

The join-prune interval multiplied by the count is considered as join or prune hold time (specified in seconds), which is used in the join or prune messages. It is recommended to use the default configuration for `pim ipv4 join-prune interval`, and modify the `pim ipv4 join-prune count` to increase the join or prune holdtime. Increasing the join-prune hold time delays the deletion of an S,G route on the upstream neighbor when join-prune messages are not sent to the neighbor. The maximum possible value for join or prune hold-time is 65535.

The `no pim ipv4 join-prune count` and `default pim ipv4 join-prune count` commands restore the default join or prune count for the configuration mode interface by removing the corresponding `pim ipv4 join-prune count` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration
Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 join-prune count count_value
no pim ipv4 join-prune count count_value
default pim ipv4 join-prune count count_value
```

**Parameters**

`count_value` The number of missed join or prune after which the route expires. Value ranges from 1.5 to 65535.

**Example**

This command indicates the number of times a join or prune messages can be missed.

```
switch(config)# interface Ethernet 1/1
switch(config-if-Et1/1)# pim ipv4 join-prune count 5
switch(config-if-Et1/1)#
```
15.3.5.16  pim ipv4 join-prune interval

The `pim ipv4 join-prune interval` command specifies the period between join or prune messages that the configuration mode interface originates and sends to the upstream RPF neighbor. The `no pim ipv4 join-prune interval` and `default pim ipv4 join-prune interval` commands restores the default join or prune interval to 60 seconds for the configuration mode interface by removing the corresponding `pim ipv4 join-prune interval` command from `running-config`.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

```
pim ipv4 join-prune interval [period]
no pim ipv4 join-prune interval [period]
default pim ipv4 join-prune interval [period]
```

**Parameters**

`period` join or prune interval (seconds). Value ranges from 1 to 18724. Default is 60.

**Example**

This command configures 75-second intervals between join or prune messages originating from VLAN interface 4.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 join-prune interval 75
switch(config-if-Vl4)#
```
15.3.5.17  pim ipv4 neighbor-filter

The `pim ipv4 neighbor-filter` command configures the configuration mode interface to filter PIM control packets on the basis of neighbor addresses listed in a specified standard access list.

The `no pim ipv4 neighbor-filter` and `default pim ipv4 neighbor-filter` commands disable the configuration mode interface from filtering PIM control packets by removing the corresponding `ip pim ipv4 neighbor-filter` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration
Interface-Port-Channel Configuration
Interface-VLAN Configuration

**Command Syntax**

`pim ipv4 neighbor-filter access_list`
`no pim ipv4 neighbor-filter`
`default pim ipv4 neighbor-filter`

**Parameters**

*access_list* name of the standard IP access list.

**Example**

This command configures the IP access list named `filter_1` to filter neighbor PIM control messages for VLAN 4.

```
switch(config)#ip access-list standard filter_1
switch(config-std-acl-filter_1)#permit 10.13.24.9/24
switch(config-std-acl-filter_1)#exit
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 neighbor-filter filter_1
switch(config-if-Vl4)#
```
15.3.5.18  pim ipv4 sparse-mode

The `pim ipv4 sparse-mode` command enables PIM IPv4 Sparse Mode (PIM-SM) and IGMP (router mode) on the configuration mode interface.

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Interface-Ethernet Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Interface-Port-Channel Configuration</td>
</tr>
<tr>
<td></td>
<td>Interface-VLAN Configuration</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Syntax</th>
<th>pim ipv4 sparse-mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>no pim ipv4</td>
<td></td>
</tr>
<tr>
<td>no pim ipv4 sparse-mode</td>
<td></td>
</tr>
<tr>
<td>default pim ipv4</td>
<td></td>
</tr>
<tr>
<td>default pim ipv4 sparse-mode</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

This command enables PIM sparse mode on VLAN 4 interface.

```
switch(config)#interface vlan 4
switch(config-if-Vl4)#pim ipv4 sparse-mode
switch(config-if-Vl4)#
```
15.3.5.19  pim ipv6 sparse-mode

The `pim ipv6 sparse-mode` command enables PIM IPv6 Sparse Mode (PIM-SM) on the configuration mode interface.

**Note:** PIM and multicast border router (MBR) must be mutually exclusive on an interface. If the interface is configured as an MBR, do not enable PIM on the interface.

The `no pim ipv6 sparse-mode`, `no pim ipv6`, `default pim ipv6 sparse-mode`, and `default pim ipv6` commands restore the default PIM settings of `disabled` on the configuration mode interface by removing the `pim ipv6 sparse-mode` command from the `running-config`.

**Command Mode**

- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration
- Interface-VLAN Configuration

**Command Syntax**

- `pim ipv6 sparse-mode`
- `no pim ipv6`
- `no pim ipv6 sparse-mode`
- `default pim ipv6`
- `default pim ipv6 sparse-mode`

**Example**

This command enables IPv6 PIM sparse mode on VLAN 8 interface.

```bash
switch(config)#interface vlan 8
switch(config-if-Vl8)#pim ipv6 sparse-mode
switch(config-if-Vl8)#
```
15.3.5.20  register local-interface

The **register local-interface** command programs the switch to fill the source field in all outbound PIM SM register packets with the IP address of a specified interface or the incoming interface of the group specified by the message. By default, the source field is filled with the IP address from the interface associated with the best route to the RP.

When the command is issued in Router-PIM Sparse-mode IPv4 Configuration Mode, it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration.

The **no register local-interface** and **default register local-interface** commands restore the default method of filling the register packet source field by removing the **ip register local-interface** statement from **running-config**.

**Command Mode**

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
register local-interface INT_NAME
no register local-interface
default register local-interface
```

**Parameters**

- **INT_NAME** Interface type and number. Values include:
  - **ethernet e_num** Ethernet interface specified by e_num.
  - **loopback l_num** Loopback interface specified by l_num.
  - **management m_num** Management interface specified by m_num.
  - **port-channel p_num** Port channel interface specified by p_num.
  - **vlan v_num** VLAN interface specified by v_num.

**Example**

These commands program the switch to fill the source field of outbound PIM SM register packets in the default VRF with the IPv4 address of loopback interface 2.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#register local-interface loopback 2
switch(config-router-pim-sparse-ipv4)#
```
15.3.5.21  router pim bidirectional

The `router pim bidirectional` command places the switch in Router-PIM Bidirectional Configuration Mode.

**Command Mode**

Global Configuration

**Command Syntax**

`router pim bidirectional`

**Example**

This command places the switch in Router-PIM Bidirectional Configuration Mode.

```
switch(config)#router pim bidirectional
switch(config-router-pim-bidir)#
```
**15.3.5.22  router pim bsr**

The `router pim bsr` command places the switch in Router-PIM BSR Configuration Mode.

**Command Mode**
Global Configuration

**Command Syntax**
```
router pim bsr
```

**Example**
This command places the switch in Router-PIM BSR Configuration Mode.

```
switch(config)#router pim bsr
switch(config-router-pim-bsr)#
```
15.3.5.23  router pim sparse-mode

The `router pim sparse-mode` command places the switch in Router-PIM Sparse-Mode Configuration Mode.

**Command Mode**
Global Configuration

**Command Syntax**

`router pim sparse-mode`

**Example**
This command places the switch in Router-PIM Sparse-Mode Configuration Mode.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#
```
15.3.5.24  **rp address**

The **rp address** command configures the address of a Protocol Independent Multicast (PIM) static rendezvous point (RP) for a specified multicast subnet. If the command does not specify a subnet, the static RP maps to all multicast groups (224/4). Dynamic RPs override static RPs unless the static RP is given priority by using the **override** option of this command.

Multicast groups use RPs to connect sources and receivers. A PIM domain requires that all routers have consistently configured RP addresses.

The switch uses multiple **rp address** commands to configure multiple RPs or to assign multiple subnets to an RP. When the address of a multicast group falls within multicast subnets configured by multiple **rp address** commands, the groups RP address is selected by comparing the commands multicast subnet size.

- Different size subnets: group uses command with the largest subnet.
- Same size subnets: group uses command as determined by hash algorithm.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The **no rp address** and **default rp address** commands remove the corresponding **rp address** command from **running-config**.

**Command Mode**

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

**rp address** rp_addr [MULTICAST_SUBNET][HASHMASK_LENGTH][BSR_OVERRIDE][PRIORITY_NUM]

**no rp address** rp_addr [MULTICAST_SUBNET]

**default rp address** rp_addr [MULTICAST_SUBNET]

**Parameters**

- **rp_addr** Rendezvous point IP address (dotted decimal notation).
- **MULTICAST_SUBNET** Multicast IP address space (CIDR or address-mask).
  - <no parameter> Default multicast group IP address of 224/4.
  - **gp_addr** Multicast group IP address (CIDR or address-mask).
  - **access-list acl_name** Standard access control list that specifies the multicast group address.
  - **acl_name** Standard access control list that specifies the multicast group address.
- **HASHMASK_LENGTH** Length (in bits) of the hash mask.
  - <no parameter> hash mask remains unchanged from previous setting.
  - **hashmask <0 - 32>** hash mask length (in bits). Default value is 30.
- **BSR_OVERRIDE** Configures priority relative to dynamic RPs selected by BSR.
  - <no parameter> Dynamic RPs have priority over specified RP.
  - **override** RP has priority over dynamic RPs.
- **PRIORITY_NUM** BSR election priority rating. Larger numbers denote higher priority. Default value is 0.
  - <no parameter> priority remains unchanged from previous setting.
  - **priority <0 - 255>** priority rating.

**Example**
These commands configure 10.17.255.2 as a static RP for all multicast groups in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp address 10.17.255.2
switch(config-router-pim-sparse-ipv4)#
```
15.3.5.25  rp allow

The rp allow command accepts and allows PIM (*,G) join message with an RP address that is different from the configured RPs for that particular (*,G).

The no rp allow and default rp allow commands disable this behavior by removing the corresponding rp allow command from running-config.

Command Mode
Router-PIM Sparse-mode IPv4 Configuration
Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax
rp allow
no rp allow
default rp allow

Examples
• These commands configure the switch to accept PIM (*,G) join messages in the default VRF that include RP addresses not configured on the switch for that (*,G) route.

```
switch(config-router-pim-sparse)# ipv4
switch(config-router-pim-sparse-ipv4)# rp allow
```

• These commands configure the switch to accept PIM (*,G) join messages in VRF blue that include RP addresses not configured on the switch for that (*,G) route.

```
switch(config-router-pim-sparse)# vrf blue
switch(config-router-pim-sparse-vrf-blue)# ipv4
switch(config-router-pim-sparse-vrf-blue-ipv4)# rp allow
```
15.3.5.26 rp candidate

The `rp candidate` command configures the switch as a candidate rendezvous point (C-RP). The BSR selects a multicast groups dynamic RP set from the list of C-RPs in the PIM domain. The command specifies the interface (used to derive the RP address), C-RP advertisement interval, and priority rating. The BSR selects the RP set by comparing C-RP priority ratings. The C-RP advertisement interval specifies the period between successive C-RP advertisement message transmissions to the BSR.

**Running-config** supports multiple multicast groups through multiple `rp candidate` statements:

- All commands must specify the same interface. Issuing a command with an interface that differs from existing commands removes all existing commands from **running-config**.
- **Running-config** stores the `interval` setting in a separate statement that applies to all `rp candidate` statements. When a command specifies an interval that differs from the previously configured value, the new value replaces the old value and applies to all configured `rp candidate` statements. The default `interval` value is 60 seconds.

When the command is issued in Router-Multicast Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration Mode.

The `no rp candidate` and `default rp candidate` commands remove `rp candidate` from **running-config** for the specified group. When these commands do not specify a multicast group, all `rp candidate` statements are removed from **running-config**.

The `no rp candidate interval` and `default rp candidate interval` commands restore the interval setting to the default value of 60 seconds. The `no rp candidate priority` and `default rp candidate priority` commands restore the priority setting to the default value of 0.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Bidirectional IPv4 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**

```plaintext
Note: The INTERFACE parameter is always listed first. All other parameters can be placed in any order.

rp candidate INTERFACE [GROUP_ADDR][PRIORITY_NUM][INTERVAL_PERIOD]
no rp candidate [INTERFACE][GROUP_ADDR]
no rp candidate [INTERFACE] interval
no rp candidate [INTERFACE] priority
default rp candidate [INTERFACE][GROUP_ADDR]
default rp candidate [INTERFACE] interval
default rp candidate [INTERFACE] priority
```

**Parameters**

- **INTERFACE** Switch uses IP address of specified interface as its C-RP address. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
- **vxlan** `vx_num` VXLAN interface specified by `vx_num`.
- **GROUP_ADDR** address of multicast group for which candidate is configured. Options include:
  - `<no parameter>` default multicast group (224.0.0.0/4).
  - **net_addr** multicast IPv4 subnet address (CIDR or address mask).
  - **access-list** `acl_name` standard access control list that specifies the multicast group address.
- **PRIORITY_NUM** RP selection priority rating. Smaller numbers denote higher priority.
  - `<no parameter>` priority rating is set to the default value of 0.
  - **priority** `<0 - 255>` priority rating.
- **INTERVAL_PERIOD** Period between consecutive RP-advertisement message transmissions (seconds). Value also applies to previously configured `rp candidate` statements.
  - `<no parameter>` interval remains unchanged from previous setting.
  - **interval** `<10 - 16383>` transmission interval.

**Example**

These commands configure a switch as a candidate RP for the multicast group 235.1.1.0/24 with a priority of 48 and an RP advertisement interval of 45 seconds in the default VRF. The switch advertises the IP address assigned to VLAN 24 as its RP address.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#rp candidate vlan 24 235.1.1.0/24 priority 48 interval 45
switch(config-router-pim-sparse-ipv4)#
```
15.3.5.27 rp hash algorithm modulo

The `rp hash algorithm modulo` command configures the load-balancing scheme across available rendezvous points (RP).

The configuration results in a round robin-based load balancing across available RPs, achieved by module operation of the destination group address with the number of RPs available.

The `no rp hash algorithm modulo` and `default rp hash algorithm modulo` commands result in the default load-balancing scheme which is to use a hash function to get a group-RP mapping.

**Command Mode**

- Router-PIM Sparse-mode IPv4 Configuration
- Router-PIM Sparse-mode VRF IPv4 Configuration
- Router-PIM Sparse-mode IPv6 Configuration
- Router-PIM Sparse-mode VRF IPv6 Configuration
- Router-PIM Bidirectional VRF IPv4 Configuration

**Command Syntax**

- `rp hash algorithm modulo`
- `no rp hash algorithm modulo`
- `default rp hash algorithm modulo`

**Examples**

- These commands configures the hash algorithm module for a VRF named blue in the Router-PIM sparse-mode IPv4 configuration mode.

```plaintext
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#vrf red
switch(config-router-pim-sparse-vrf-red-ipv4)#rp hash algorithm modulo
```

- These commands configures the hash algorithm module for a VRF named blue in the Router-PIM bidirectional VRF IPv4 configuration mode.

```plaintext
switch(config)#router pim bidirectional
switch(config-router-pim-bidir)#ipv4
switch(config-router-pim-bidir-ipv4)#vrf red
switch(config-router-pim-bidir-vrf-red-ipv4)#rp hash algorithm modulo
```
15.3.5.28  rp-candidate advertisement-filter

The **rp-candidate advertisement-filter** command filters the RP candidate advertisements from certain IP addresses. When **rp-candidate advertisement-filter** command is configured, PIM BSR filters RP candidate messages from ip-addresses matching the prefix list from the access-list that is configured.

The **no rp-candidate advertisement-filter** and **default rp-candidate advertisement-filter** commands removes **rp-candidate advertisement-filter** from **running-config** for the specified group.

Command Mode

Router-PIM BSR IPv4 Configuration

Router-PIM BSR VRF IPv4 Configuration

Command Syntax

**rp-candidate advertisement-filter** access-list **access-list_name**

**no rp-candidate advertisement-filter** access-list **access-list_name**

**default rp-candidate advertisement-filter** access-list **access-list_name**

Parameters

**access-list_name** Standard access control list that specifies the multicast group address.

Example

These commands configure the switch as a candidate RP advertisement filter for the multicast group in the non-default VRF.

```
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#rp-candidate advertisement-filter
   access-list test1
switch(config-router-pim-bsr-vrf-red-ipv4)#rp-candidate advertisement-filter
   access-list test2
```
15.3.5.29 sg-expiry-timer

The `sg-expiry-timer` command configures the (S, G) expiry timer interval for PIM-SM (S, G) multicast routes. The command does not apply to (*, G) mroutes.

When the command is issued in Router-Multicast Configuration mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-Multicast VRF Configuration mode.

The `no sg-expiry-timer` and `default sg-expiry-timer` commands restore the default setting of 210 seconds by removing the `sg-expiry-timer` statement from `running-config`.

Command Mode

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

Command Syntax

```
sg-expiry-timer period
no sg-expiry-timer
default sg-expiry-timer
```

Parameters

`period` expiry timer interval (seconds). Value ranges from 120 to 65535 seconds. The default value is 210 seconds.

Example

These commands configure 150 seconds as the (S,G) expiry timer interval is in the default VRF.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#sg-expiry-timer 150
switch(config-router-pim-sparse-ipv4)#
```
15.3.5.30  show ip pim bsr

The show ip pim bsr command displays the switch's bootstrap router (BSR) information.

**Command Mode**
EXEC

**Command Syntax**
show ip pim bsr [GROUP_FILTER]

**Parameters**
- **GROUP_FILTER** specifies groups for which the command displays information.
  - `<no parameter>` Displays data for all groups.
  - `net_addr` Displays message for specified group address. (CIDR or address mask).

**Example**

This command configures the switch's BSR information.

```
switch>show ip pim bsr
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
BSR address: 10.1.1.1
Uptime: 00:14:42, BSR Priority: 0, Hash mask length: 30
Next bootstrap message in 00:00:05
```
15.3.5.31  **show ip pim config-sanity**

The **show ip pim config-sanity** command displays diagnostic information about the switch's PIM configuration.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim config-sanity`

**Example**

This command displays PIM configuration diagnostic information.

```
switch>show ip pim config-sanity
DISCLAIMER: Below are only hints of potential PIM misconfiguration. They do not necessary imply that there is a real problem.

The interfaces with PIM which are down: V14
switch>
```
The `show ip pim interface` command displays information about interfaces configured for PIM.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim interface`[INT_NAME][INFO_LEVEL]

**Parameters**

- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

- **INFO_LEVEL** specifies level of information detail provided by the command.
  - `<no parameter>` table of basic configuration information.
  - `detail` list of complete configuration information.

**Examples**

- This command displays information about all interfaces on which PIM is enabled.

```
switch>show ip pim interface
Address InterfaceMode Neighbor Hello DR DR Address PktsQed
 PktsDropped Count Intvl Pri
10.17.254.30   Vlan3910 sparse1 30 1 10.17.254.30 0 0
10.17.254.162  Vlan3925 sparse2 30 1
10.17.254.106  Vlan3912 sparse1 30 1
10.17.254.106  Vlan3912 0 0

10.17.254.138  Ethernet12 0 0
switch>
```

- This command displays detailed PIM information for VLAN 26 interface.

```
switch>show ip pim interface vlan 26 detail
Interface address is 172.17.26.1
Vif number is 1
PIM: enabled
  PIM version: 2, mode: sparse
  PIM DR: 172.17.26.1 (this system)
  PIM DR Priority: 1
  PIM neighbor count: 0
  PIM Hello Interval: 30 seconds
  PIM Hello Priority: 1
  PIM Hello Lan Delay: 500 milliseconds
  PIM Hello Override Interval: 2500 milliseconds
  PIM Hello Lan Prune Delay in use
  PIM Hello Generation ID: 0x4a05aa0
  PIM Hello Generation ID is not required
  PIM Triggered Hello Delay: 5 seconds
  PIM Join-Prune Interval: 60 seconds
  PIM State-Refresh processing: disabled
  PIM State-Refresh Interval: unknown seconds
  PIM Graft Retry Interval: unknown seconds
```
PIM domain border: disabled
switch>
show ip pim neighbor

The `show ip pim neighbor` command displays information about Protocol Independent Multicast (PIM) neighbors discovered by hello messages.

**Command Mode**
EXEC

**Command Syntax**
```
show ip pim neighbor [INT_NAME][BFD_DATA]
```

**Parameters**

- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.
- **BFD_DATA** Specifies inclusion of BFD data.
  - `<no parameter>` BFD data is not displayed.
  - `bfd` BFD data is displayed.

**Examples**

- This command displays information about neighbor PIM routers.
```
switch>show ip pim neighbor
PIM Neighbor Table
Neighbor Address   Interface       Uptime     Expires    Mode
10.17.255.2        Vlan2028        21d22h     00:01:31   sparse
switch>
```
- This command displays information about neighbor PIM routers and the status of BFD.
```
switch>show ip pim neighbor bfd
PIM Neighbor Table
Flags: U - BFD is enabled and is UP
I - BFD is enabled and is INIT
D - BFD is enabled and is DOWN
N - Not running BFD
Neighbor Address   Interface       Uptime     Expires    ModeFlags
10.17.255.2        Vlan2028        21d22h     00:01:31   sparseU
switch>
```
15.3.5.34 show ip pim protocol counters

The `show ip pim protocol` command displays statistics about Protocol Independent Multicast (PIM) control messages sent and received by the switch.

Command Mode
EXEC

Command Syntax

```
show ip pim protocol counters[INT_NAME]
```

Parameters

- **INT_NAME** Interface type and number. Values include
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `loopback l_num` Loopback interface specified by `l_num`.
  - `management m_num` Management interface specified by `m_num`.
  - `port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `vlan v_num` VLAN interface specified by `v_num`.
  - `vxlan vx_num` VXLAN interface specified by `vx_num`.

Example

This command displays statistics about inbound and outbound PIM control messages.

```
switch>show ip pim protocol counters
PIM Control Counters

                Received   Sent   Invalid

switch>
```
**15.3.5.35 show ip pim register-source**

The `show ip pim register-source` command displays the name of the interface from where the switch derives the IP address that it uses to fill the source field in all outbound PIM SM register packets. The `register local-interface` command specifies this interface.

By default, the source field is filled with the IP address from the interface associated with the best route to the RP. The `show ip pim register-source` command does not return a value when the source field is filled with the default value.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim register-source`

**Example**

This command displays the register-source interface.

```
switch>show ip pim register-source
Ethernet22
switch>
```
show ip pim rp

The `show ip pim rp` command displays the status and multicast group of each cached rendezvous point (RP).

**Command Mode**
EXEC

**Command Syntax**
show ip pim rp

**Example**
This command displays the cached RPs.

```
switch>show ip pim rp
show ip pim rp
The PIM RP Set
Group: 224.0.0.0/4
RP: 10.1.2.3
Uptime: 00:05:12, Expires: never, Priority: 1 Override: 1
```
15.3.5.37  show ip pim rp-candidate

The `show ip pim rp-candidate` command displays the rendezvous point (RP) that is used for a specified multicast group.

**Command Mode**

EXEC

**Command Syntax**

`show ip pim rp-candidate`

**Example**

This command displays the switch's candidate-RP information.

```
switch>show ip pim rp-candidate
Candidate RP information
Candidate RP Address: 10.0.12.2
CRP Holdtime: 150 seconds
Group 224.2.0.0/16 Priority 2
```
The `show ip pim rp-hash` displays the group to RP-hash mapping for the specified group and the list of qualifying candidate RPs.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim rp-hash [ipv4_addr][INFO_LEVEL]
```

**Parameters**

- `ipv4_addr` multicast group IPv4 address.
- `INFO_LEVEL` specifies level of information detail provided by the command.
  - `<no parameter>` RP-hash map and list of candidate RPs.
  - `detail` includes data about the selected RP.

**Example**

This command displays the RP that the switch uses for multicast group 224.1.0.0.

```
switch>show ip pim rp-hash 224.1.0.0
RP 10.1.2.3
```
15.3.5.39  show ip pim upstream joins

The `show ip pim upstream joins` command displays the join messages that the switch is scheduled to send.

**Command Mode**

EXEC

**Command Syntax**

```
show ip pim upstream joins [JOIN_ADDRESSES] [NEIGHBOR_FILTER]
```

**Parameters**

- **JOIN_ADDRESSES** Filters messages by source and group addresses.
  - `<no parameter>` displays all join messages.
  - `source_addr` displays all join messages for specified source group IPv4 address.
  - `group_addr` displays all join messages for specified multicast IPv4 address.
  - `source_addr group_addr` displays join message with specified source and group addresses.
  - `group_addr source_addr` displays join message with specified group and source addresses.

`group_addr` must be a valid multicast IPv4 address.

- **NEIGHBOR_FILTER** specifies neighbors for which command provides data.
  - `<no parameter>` Displays messages for all neighbors.
  - `neighbor neighbor_addr` Displays message for specified neighbor address.

**Example**

This command displays the list of join messages the switch is scheduled to send. The example only displays the first two messages.

```
switch>show ip pim upstream joins

------------- show ip pim upstream joins -------------
Neighbor address: 10.1.1.1
Via interface: 10.1.1.2
Next message in 1 seconds
  Group: 10.10.10.3
    Joins:
      10.25.1.1/32 SPT
    Prunes:
      No prunes included
Neighbor address: 10.1.1.6
Via interface: 10.1.1.5
Next message in 1 seconds
  Group: 10.14.1.69
    Joins:
      10.105.14.3/32 SPT
    Prunes:
      No prunes included
switch>
```
The `spt threshold` command configures shortest path tree (SPT) threshold actions for IPv4 multicast groups. To specify the threshold action for multicast groups that match a specified access control list (ACL), use the `match list` option. When the command is issued without this option, it is applied throughout the configuration-mode VRF. Any ACL-based configuration overrides global configuration.

- When `running-config` does not list this command, the switch joins the SPT immediately after receiving the first PIM packet from a new source. The switch joins the SPT by sending PIM join message toward the source.
- When `running-config` lists this command with a value of infinity, the switch never joins the SPT.

The `no spt threshold` and `default spt threshold` commands remove the corresponding `spt threshold` command from `running-config`.

**Command Mode**

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```
spt threshold {0 | infinity} [match list acl_name]
no spt threshold {0 | infinity} [match list acl_name]
default spt threshold {0 | infinity} [match list acl_name]
```

**Parameters**

- `0` The switch immediately joins the SPT. This is the default value.
- `infinity` The switch never joins the SPT.
- `acl_name` name of access control list. If no ACL is supplied, the configuration is applied to all multicast groups within the VRF which are not configured by an ACL.

**Example**

This command configures the switch in the default VRF to immediately join the SPT for multicast groups matched by the ACL `group-1`.

```
switch(config)#router pim sparse-mode
switch(config-router-pim-sparse)#ipv4
switch(config-router-pim-sparse-ipv4)#spt threshold 0 match list group-1
switch(config-router-pim-sparse-ipv4)#
```
15.3.5.41  ssm range

The `ssm range` command defines the source specific multicast (SSM) range of IP multicast addresses.

SSM is a multicast packet delivery method where only packets originating from a specific source address requested by a receiver are routed to that receiver. SSM explicitly excludes the use of (*,G) join for applicable multicast groups. Source-specific multicast differs from any-source multicast (ASM), where a receiver expresses interest in traffic to a multicast address, then receives traffic from all multicast sources sending to that address.

When the command is issued in Router-PIM Sparse-mode IPv4 Configuration Mode it applies to the default VRF; to use this command in a non-default VRF, issue it in Router-PIM Sparse-mode VRF IPv4 Configuration Mode.

The `no ssm range` and `default ssm range` commands remove the SSM IP multicast address range by deleting the `ssm range` statement from `running-config`.

**Command Mode**

Router-PIM Sparse-mode IPv4 Configuration

Router-PIM Sparse-mode VRF IPv4 Configuration

**Command Syntax**

```plaintext
ssm range {acl_name|standard}

no ssm range

default ssm range
```

**Parameters**

- `acl_name` sets the SSM range to address set specified by the standard ACL.
- `standard` sets the SSM range to 232/8.

**Examples**

- These commands configure the SSM address range to 232/8 in the default VRF.

  ```plaintext
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#ssm range standard
  switch(config-router-pim-sparse-ipv4)#
  ```

- These commands configure the SSM address range to those permitted by the LIST_1 standard ACL in the default VRF. The ACL permits the subnet address range 233.0.0.0/24.

  ```plaintext
  switch(config)#ip access-list standard LIST_1
  switch(config-std-acl-LIST_1)#permit 233.0.0.0/24
  switch(config-std-acl-LIST_1)#exit
  switch(config)#router pim sparse-mode
  switch(config-router-pim-sparse)#ipv4
  switch(config-router-pim-sparse-ipv4)#ssm range LIST_1
  switch(config-router-pim-sparse-ipv4)#
  ```
15.3.5.42 sztimeout

The sztimeout command configures the maximum span of active scope-zone. The no sztimeout and default sztimeout commands delete the current scope zoned timeout configuration.

Command Modes
Router-PIM BSR IPv4 Configuration
Router-PIM BSR VRF IPv4 Configuration

Syntax
sztimeout timeout
no sztimeout
default sztimeout

Parameter
timeout Maximum span of active scope-zone in seconds. The value ranges from 120 to 4294967295. The default value is 1300.

Guideline
The scope zoned timeout must contain a minimum value of 10 times of configured holdtime; else the system displays a warning message.

Examples
• This command configures 600 seconds as the maximum of active scope-zone in router-pim bsr ipv4 configuration mode.

switch(config)#router pim bsr
switch(config-router-pim-bsr)#ipv4
switch(config-router-pim-bsr-ipv4)#sztimeout 600
switch(config-router-pim-bsr-ipv4)#

• This command configures 2200 seconds as the maximum of active scope-zone in router-pim bsr vrf ipv4 configuration mode.

switch0(config)#router pim bsr
switch(config-router-pim-bsr)#vrf vrf01
switch(config-router-pim-bsr-vrf-vrf01)#ipv4
switch(config-router-pim-bsr-vrf-vrf01-ipv4)#sztimeout 2200
switch(config-router-pim-bsr-vrf-vrf01-ipv4)#

15.4 Multicast Source Discovery Protocol (MSDP)

Multicast Source Discovery Protocol (MSDP) describes a topology that connects multiple IPv4 Protocol Independent Multicast Sparse-Mode (PIM-SM) domains. Each PIM-SM domain uses its independent Rendezvous Point (RP) without depending on RPs in other domains.

These sections describe the Arista MSDP implementation.

• MSDP Introduction
• MSDP Description
• MSDP Configuration
• MSDP Commands
15.4.1 MSDP Introduction

Arista switches support these MSDP features:

- Basic MSDP speaker functions.
- MSDP peer configuration: description, connect-source interface, keepalive time, and hold time.
- ACL filtering of inbound and outbound Source-Active (SA) messages.
- Mesh groups.
- Display of peer status.
- Display of filtered SA messages received from MSDP peers.

These MSDP features are not supported:

- MSDP is not supported with Anycast-RP (RFC4610).
- IP packet encapsulation.

15.4.2 MSDP Description

The Multicast Source Discovery Protocol (MSDP) defines a topology connecting Protocol Independent Multicast sparse mode (PIM-SM) domains.

MSDP provides inter-domain access to multicast sources in all domains by enabling all rendezvous points (RPs) to discover multicast sources outside of their domains. RPs also use MSDP to announce sources that are sending to a multicast group.

- **MSDP Speakers**
- **Network Configuration**
- **MSDP Exchange Processes**

15.4.2.1 MSDP Speakers

An MSDP speaker is a router in a PIM-SM domain that has MSDP peering sessions with MSDP peers in other domains. An MSDP peering session is a TCP connection through which peers exchange MSDP control information. An MSDP peer is a router that is connected to the speaker through a peering session.

PIM uses MSDP to register a local source with remote domain RPs through Source Active (SA) messages, which originate at the local domain’s RP. Receivers in remote PIM-SM domains depend only on RPs in their domains to learn of multicast data sources in other domains. Multicast data is subsequently delivered from a source to receivers in different domains through a PIM-SM source tree. MSDP Speaker Configuration describes the process of configuring MSDP speakers.

15.4.2.2 Network Configuration

The TCP connections between RPs are defined either through an underlying unicast routing table or by configuring a default MSDP peer. A typical MSDP configuration utilizes a BGP specified routing table. SA messages are MSDP control messages that peers exchange during peering sessions.

- **Source Active Messages**
- **Reverse Path Forwarding**
- **Default MSDP Peers**

15.4.2.2.1 Source Active Messages

A Source Active (SA) message is a message that an RP creates and sends to MSDP peers when it learns of a new multicast source through a PIM register message. RPs that intend to originate or receive SA messages must establish MSDP peering with other RPs, either directly or through intermediate MSDP peers. An RP that is not a DR on a shared network should only originate SAs in
response to register messages it receives from the DR. It does not originate SA's for directly connected sources in its domain.

SA messages contain the following fields:
- Source address of the data source.
- Group address that receives data sent by the source.
- IP address of the RP.

The SA Cache is the repository of SA messages received by the MSDP speaker. The switch always stores received SA messages. Managing the SA Cache describes procedures that limit the size of the SA cache and options for displaying the cache.

15.4.2.2 Reverse Path Forwarding

Reverse path forwarding (RPF) is a multicast packet transport technique that ensures loop-free packet forwarding by using a router’s unicast routing table. Traffic forwarding is based on source addresses instead of destination addresses. RPF is implemented as defined in RFC 3618.

Packet forwarding is based on the packet’s unicast reverse path. An RPF router prevents network loops by only forwarding a packet when it enters through the interface holding its source routing entry.

When a multicast packet enters a router’s interface, the router checks the reverse path of the packet by examining the list of networks that are reachable through the input interface. If the list contains a matching routing entry for the multicast packet’s source IP address, the packet is forwarded to all other interfaces that are participants in the multicast group. Otherwise, the packet is dropped.

RPF requires that the unicast routing table is correct and converged. It also assumes that the use of symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links.

Displaying RPF Peers describes commands that display RPF peers.

15.4.2.3 Default MSDP Peers

The default peer is the MSDP peer from which the MSDP speaker accepts SA messages. If there is only one MSDP peer, all of its SA messages will be accepted. When multiple default peers are configured the switch uses the first default peer to appear in running-config. Default MSDP peers invalidate the use of RPF over unicast routing tables.

Each default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages. When running-config contains multiple default peers with prefix lists, an SA is accepted from the first default peer in running-config whose prefix list contains the RP in the SA. The speaker accepts all remaining SAs from the first default peer that is not associated with a prefix list.

Configuring the Default Peer describes commands that configure default peers.

15.4.3 MSDP Exchange Processes

- Control Information Exchange
- MSDP Data Exchange

15.4.2.3.1 Control Information Exchange

An RP originates an SA message when a source registers with the RP to send data to a multicast group. RPs periodically originate SA messages while its registered sources send data to maintain messages in SA caches of its MSDP peers. RPs that have no registered sources periodically send keepalive messages to maintain TCP connections with its peers.

MSDP defines the following timers that specify the transmission frequency of control messages:
• SA Advertisement Time: Duration of SA Advertisement intervals. An RP sends periodic SA messages to reference each registered source once per interval. SA advertisement time is 60 seconds.
• Keepalive Time: Period between the transmission of consecutive keepalive messages. Default keepalive time is 60 seconds. Minimum keepalive time is one second.
• Hold Timer: Period an MSDP speaker maintains a peer TCP connection after receiving an SA or keepalive message from the peer. Default time is 75 seconds. Minimum hold time is three seconds.

15.4.2.3.2 MSDP Data Exchange

This sequence describes the exchange of multicast data across PIM domains through MSDP:

1. When a source’s first data packet is registered by the first hop router, the RP extracts the data from the packet and forwards it down the shared tree in the PIM domain.
2. The RP informs MSDP peers of the new source by sending a Source-Active (SA) message that identifies the source, the recipient group, and the RP’s address or originator ID.
3. Upon receiving the SA message, an MSDP peer which is the RP for a multicast tree that includes members interested in the multicast sends a PIM join message (S,G) toward the data source.
4. The PIM designated router (DR) sends subsequent data encapsulated in PIM register messages directly to the remote domain’s RP when the source becomes active.
5. If the source times out, this process repeats when the source goes active again.

15.4.3 MSDP Configuration

These sections describe the configuration of the switch as an MSDP speaker and the establishment of MSDP peering sessions.

• MSDP Speaker Configuration
• Establishing MSDP Peers
• MSDP Network Configuration
• Managing the SA Cache
• Configuring MSDP in a non-default VRF

MSDP requires that TCP port 639 (MSDP) is open on the control plane. The default control-plane ACL includes a permit rule that allows TCP packets access through the MSDP port.

15.4.3.1 MSDP Speaker Configuration

The switch is configured as an MSDP speaker when MSDP is enabled. MSDP is enabled by configuring an MSDP peer. Configuring an MSDP Peer describes the process of configuring an MSDP peer.

Source-Address (SA) messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. MSDP provides a method of assigning an originator ID address, which the speaker uses in place of its RP address when advertising SA messages. The originator-id local-interface command configures the switch to set the RP address to the specified interface’s IP address in SA messages that it originates as an MSDP speaker.

Only RPs originate SA messages and only for its registered sources. RPs do not originate periodic SA messages for sources in other PIM domains. MSDP speakers that are not RPs do not originate periodic SA messages. Intermediate MSDP speakers forward SA messages received from other domains. Intermediate speakers are not required to be RPs.
**Example**

These commands configure the switch to use the IP address assigned to loopback interface 100 as the RP address in SA messages that it originates.

```plaintext
switch(config)#router msdp
switch (config-router-msdp)#originator-id local-interface loopback 100
```

15.4.3.2 Establishing MSDP Peers

These sections describe MSDP Peer configuration tasks.

- Configuring an MSDP Peer
- Mesh Groups
- Filtering SA Messages
- Keep-alive, Hold Time, and Reset Time Configuration
- Displaying Peer Information

15.4.3.2.1 Configuring an MSDP Peer

The switch attempts to establish MSDP peering sessions through IP addresses configured as MSDP peers. The `peer` command configures a specified address as an MSDP peer and enables the switch as an MSDP speaker if no other peers are configured. The peering session with the device at the specified network is established over a TCP connection. The `local-interface` command can be used to specify an interface through which the switch establishes the TCP session. When no interface is specified, the connection is established through an interface determined by existing routing algorithms.

To display MSDP peer information, enter `show ip msdp peer`.

**Example**

These commands assign an IP address to loopback interface 100, then configure 10.4.4.12 as an MSDP peer and establish the TCP peer session through the loopback.

```plaintext
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.6.8.6/24
switch(config-if-Lo100)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp)#local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
    State: Connect
    Resets: 0
    Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

To associate descriptive text with the specified MSDP peer, use the `description (MSDP)` command.

**Example**

These commands associate the string NORTH with the MSDP peer located at 10.4.4.12.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#description NORTH
```
To close the peering session with the specified MSDP peer, use the disabled (MSDP) command. This terminates the TCP connection between the switch and the peer. The peer remains configured and the peer session can be resumed by removing the disabled command from running-config.

**Examples**

- This command closes the peering session with the MSDP peer at 10.4.4.12.

  ```
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.4.4.12
  switch(config-router-msdp-peer-10.4.4.12)#disabled
  switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
    State: Disabled
    Resets: 0
    Connection Source: Loopback100 (10.6.8.6)
  SAs accepted:
  switch(config-router-msdp-peer-10.4.4.12)#
  ```

- This command reopens the peering session with the peer at 10.4.4.12.

  ```
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.4.4.12
  switch(config-router-msdp-peer-10.4.4.12)#no disabled
  switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
  MSDP Peer 10.4.4.12
  Description: NORTH
  Connection status:
    State: Connect
    Resets: 0
    Connection Source: Loopback100 (10.6.8.6)
  SAs accepted:
  switch(config-router-msdp-peer-10.4.4.12)#
  ```

### 15.4.3.3.2 Mesh Groups

Each node in a fully meshed network is directly connected to every other node in the network. Each peer in a fully meshed MSDP speaker network can be configured as a member of a mesh group. SA messages received from a mesh group peer are not forwarded to other members of the mesh group.

To configure an MSDP peer connection as an MSDP mesh group member, use the mesh-group command. An MSDP peer can be assigned to multiple mesh groups. Multiple peer connections can be assigned to the same mesh group.

**Note:** Peer-specific mesh-group configuration is performed in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode. To remove all configured connections from a mesh group, use the no mesh-group command in Router MSDP Configuration Mode.

To display the mesh group membership of configured MSDP peers, enter show msdp mesh-group.
Example

These commands configure the MSDP peer connection to 10.1.1.14 as a member of the AREA-1 mesh group, then displays members of mesh groups to which configured MSDP peers belong.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.1.1.14
switch(config-router-msdp-peer-10.1.1.14)# mesh-group AREA-1
switch(config-router-msdp-peer-10.1.1.14)# show msdp mesh-group
Mesh Group: AREA-1
  10.1.1.14
Mesh Group: tier_01
  10.24.18.13
Mesh Group: tier_02
  10.26.101.18
switch(config-router-msdp-peer-10.1.1.14)#
```

15.4.3.2.3 Filtering SA Messages

The switch can filter Source-Active (SA) messages that it sends and receives with access control lists (ACLs). The commands accept standard and extended ACLs. The address field in standard ACLs filter an SA message on its group address.

The `sa-filter in` command assigns an ACL to filter inbound SA messages from the MSDP peer connection being configured. The switch only accepts SA messages from the peer that pass the ACL. The switch accepts all SA messages from peers that are not assigned an input ACL. A peer can be assigned only one input filter ACL. Subsequent `sa-filter in` commands for a peer replace the existing command.

The `sa-filter out` command assigns an ACL as a filter for outbound SA messages to the MSDP peer connection being configured. The switch only sends SA messages to the peer that pass the ACL. The switch sends all specified SA messages to peers not assigned an output filter ACL. A peer can be assigned only one output ACL. Subsequent `sa-filter out` commands for a peer replace the existing command.

Example

These commands assign the IP ACLs named `LIST-IN` as the inbound SA message filter and `LIST-OUT` as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

```
switch(config)# router msdp
switch(config-router-msdp)# peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)# sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)# sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)# show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
  State: Listen
  Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
  Input Filter: LIST-IN
  Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
```

15.4.3.2.4 Keep-alive, Hold Time, and Reset Time Configuration

To configure the MSDP keep-alive and hold time intervals for a specified MSDP peer connection, use the `keepalive (MSDP)` command.
• Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is 60 seconds.
• Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The hold time interval must be longer than or equal to the keep-alive time interval.

Example

• This command sets the keep-alive time to 45 seconds and the hold time to 80 seconds for the MSDP peer connection to 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#keepalive 45 80
```

To specify the period that the switch waits after an MSDP peering session is reset before attempting to reestablish the session, enter connection retry interval. The default period is 30 seconds.

Example

• This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

```
switch(config)#router msdp
switch(config-router-msdp)#connection retry interval 45
```

15.4.3.2.5 Displaying Peer Information

To display the MSDP peers, enter show ip msdp summary. The command also displays the operational status of each peer and the number of messages from the peers in the SA cache.

Example

This command displays the configured peers, the status of the peers, and the number of SA messages received from those peers.

```
switch(config)#show ip msdp summary
MSDP Peer Status Summary
Peer Address State SA Count
192.168.3.18 Up 0
192.168.3.16 Up 0
192.168.3.37 Listen 0
192.168.3.46 Up 0
192.168.3.47 Up 0
```

15.4.3 MSDP Network Configuration

• Displaying RPF Peers
• Configuring the Default Peer

15.4.3.3.1 Displaying RPF Peers

The switch uses the unicast routing table to define TCP connections between RPs by selecting the next hop peer toward the originating RP of an SA message as the reverse path forwarding (RPF) peer.
The switch forwards SA messages that it receives from the RPF peer to all other MSDP peers. The switch rejects SA messages that it receives from non-RPF peers.

To display MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP), enter `show msdp rpf-peer`.

**Example**

This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

```
switch(config)#show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```

### 15.4.3.3.2 Configuring the Default Peer

The default peer is the MSDP peer from which the MSDP speaker is configured to accept all SA messages. A default peer may be associated with a prefix list. The prefix list specifies the RPs from where the speaker accepts SA messages.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in `running-config`. Other listed default peers take effect only if the peer named in the first default-peer statement is not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent `default-peer` statements.

To configure the specified MSDP peer connection as a default peer on the switch, use the `default-peer` command. The default peer address must be a previously configured MSDP peer (configured using the `peer` command).

**Example**

These commands configure an MSDP default peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)#default-peer
```

### 15.4.3.4 Managing the SA Cache

The switch stores Source Active (SA) messages after forwarding the information. This allows new group members to learn about the source before the next SA message is received. The caching action is not configurable and cannot be disabled.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. A peer’s SA limit defines the number of SA messages the switch stores from the peer. The switch does not store SA messages from a peer whose SA limit is reached until its cached messages start expiring.

- **Limiting SA Cache Contents**
- **Displaying SA Cache Contents**
- **Verifying Consistency Between the SA Cache and the Routing Table**
15.4.3.4.1 Limiting SA Cache Contents

To configure the maximum number of SA messages from a specified MSDP peer that the switch stores in the SA cache, use the `sa-limit` command. The default limit of SA messages that the switch can store from a specified peer is 40000.

**Example**

This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5.

```
switch(config) router msdp
switch(config-router-msdp) peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5) sa-limit 500
```

The maximum number of SA messages that the switch can store in the SA cache for a specified multicast group address is configured by the `group-limit` command. The default limit of SA messages that the switch can store from a specified group is 40000.

**Example**

This command sets the maximum number of 1000 SAs for multicast group 225.13.15.8/29.

```
switch(config) router msdp
switch(config-router-msdp) group-limit 1000 source 225.13.15.8/29
```

The maximum number of rejected SA messages that the switch can store in the SA cache is configured by the `ip msdp rejected-limit` command. The default limit of rejected SA messages that the switch can store is 40000.

**Example**

This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config) router msdp
switch(config-router-msdp) ip msdp rejected-limit 5000
```

Contents of the SA message cache are removed by the `clear ip msdp sa-cache` command. The command provides options for removing all cache contents or only contents of a specific multicast group.

**Example**

This command deletes all SA message cache contents.

```
switch(config) router msdp
switch(config-router-msdp) clear ip msdp sa-cache
```

15.4.3.4.2 Displaying SA Cache Contents

SA message cache contents are displayed by the `show ip msdp sa-cache` command. Filter options provided by the command for displaying partial cache contents include:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs rejected by ACL filters or cache limit exceeded conditions.
Example

This command displays the contents of the SA message cache.

```
switch(config)#show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4
(10.51.71.23, 234.1.4.1), RP 10.5.29.4, heard from 10.5.29.4
(10.53.71.27, 234.1.4.2), RP 10.3.25.4, heard from 10.3.25.4
(10.10.101.24, 234.1.4.1), RP 10.2.44.4, heard from 10.2.44.4
(10.10.151.22, 234.1.4.1), RP 10.1.12.4, heard from 10.1.12.4
```

Information about specified MSDP peers, including SAs accepted from the peer is displayed by the `show ip msdp peer` command.

Example

This command displays data for the peer at 10.2.42.4, including SAs accepted from the peer.

```
switch(config)#show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 (10.2.43.4)
SA Filtering:
  Input Filter: allow-multicast-for-msdp
  Output Filter: allow-multicast-for-msdp
SAs accepted:
  (10.62.79.30, 234.1.4.2), RP 10.2.42.4
  (10.61.79.29, 234.1.4.1), RP 10.2.42.4
  (10.62.79.30, 234.1.4.1), RP 10.2.42.4
```

The SA cache for the local PIM domain is displayed by the `show ip msdp pim sa-cache` command.

Example

This command displays the SA cache for the local PIM domain.

```
switch(config)#show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
  (10.51.71.23, 234.1.4.1), RP 10.2.43.4
  (10.20.91.26, 234.1.4.1), RP 10.2.43.4
  (10.20.91.26, 234.1.4.2), RP 10.2.43.4
  (10.20.91.24, 234.1.4.1), RP 10.2.43.4
```

15.4.3.4.3 Verifying Consistency Between the SA Cache and the Routing Table

To check the consistency between the multicast routing table and the MSDP Source-Address (SA) caches, enter `show ip msdp sanity`. When the command detects inconsistencies, it displays the cache entries that are not in the table.

Example

This command displays a sanity check that detects inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
```
Multicast (192.168.3.8, 224.1.154.1)  
(192.168.3.35, 224.1.167.1)  
(192.168.3.16, 224.1.226.1)  
(192.168.3.12, 224.1.182.1)  
(192.168.3.33, 224.1.150.1)  

May-Notify-MSDP entries not in the PIM SA cache  
(need not be an error condition)  
4.1), RP 10.2.42.4

15.4.3.5 Configuring MSDP in a non-default VRF

The MSDP can also be configured in a non-default VRF, when the default VRF used does not have a name. The following commands configure MSDP in a non-default VRF.

Example

These commands configure MSDP peer 1.1.1.1 in a non-default VRF blue.

```
switch(config)#router msdp  
switch(config-router-msdp)#vrf blue  
switch(config-router-msdp-vrf-blue)#peer 1.1.1.1
```
15.4.4 MSDP Commands

**MSDP Configuration Commands (Global)**
- connection retry interval
- group-limit
- ip msdp rejected-limit
- originator-id local-interface
- peer
- router msdp

**MSDP Peer Configuration Commands**
- default-peer
- description (MSDP)
- disabled (MSDP)
- keepalive (MSDP)
- local-interface
- mesh-group
- sa-filter in
- sa-filter out
- sa-limit

**MSDP SA Cache Commands**
- clear ip msdp sa-cache

**MSDP Display Commands**
- show ip msdp peer
- show ip msdp pim sa-cache
- show ip msdp sa-cache
- show ip msdp sanity
- show ip msdp summary
- show msdp mesh-group
- show msdp rpf-peer
The `clear ip msdp sa-cache` command removes contents of the Source-Active (SA) message cache. The command provides these filter options for removing partial cache contents:

- contents of a multicast group by specifying its group address.
- all cache contents.

**Command Mode**

Router MSDP Configuration

Router MSDP VRF Configuration

**Command Syntax**

```
clear ip msdp sa-cache [ADDRESS_FILTER]
```

**Parameters**

- `ADDRESS_FILTER` IPv4 address used to select table entries for removal.
  - `<no parameter>` All SA messages.
  - `grp_addr` Multicast group address (IPv4 address). The `grp_addr` must be a valid multicast address.

**Example**

This command deletes all SA message cache contents.

```
switch(config)#router msdp
switch(config-router-msdp)#clear ip msdp sa-cache
```
15.4.4.2 connection retry interval

The connection retry interval command specifies the period that the switch waits after an MSDP peering session is reset before trying to reestablish the session. The default period is 30 seconds.

The no connection retry interval and default connection retry interval commands reset the timer interval to the default period of 30 seconds by removing the connection retry interval command from running-config.

Command Mode
Router MSDP Configuration
Router MSDP VRF Configuration

Command Syntax
connection retry interval connect_retry
no connection retry interval connect_retry
default connection retry interval connect_retry

Parameter
connect_retry Reconnect period (seconds). Value ranges from 1 to 65535. Default is 30.

Example
This command configures the switch to wait 45 seconds after an MSDP peering session is reset before attempting to reestablish the session.

switch(config)#router msdp
switch(config-router-msdp)#connection retry interval 45
The `default-peer` command configures the specified MSDP peer connection as a default peer on the switch. The default peer configuration defines the peers from which the switch accepts Source-Active (SA) messages. When the command includes a prefix list parameter, the specified peer is the default peer for only SA messages originating from rendezvous points (RPs) covered by prefix list entries. The default peer address must be a previously configured MSDP peer (configured using the `peer` command).

Default peers provide an alternative to reverse packet forwarding (RPF) typically used by MSDP to specify the peers from which a switch accepts SA messages. However, RPF requires a unicast routing table that is correct and converged. RPF also assumes symmetric forward and reverse paths between router and sender. RPF fails on uni-directional links. Default MSDP peers invalidate the use of RPF over unicast routing tables.

The switch can designate multiple default peers:

- Switch defines one peer: A default peer statement is not required; the switch accepts SA traffic from the configured peer.
- Switch defines one default peer (no prefix list): The switch accepts all SA messages from only the default peer.
- Switch defines multiple default peers (no prefix lists): The switch accepts all SA messages from only the first default peer listed in `running-config`. Other listed default peers are used only when peers listed before them in `running-config` are not accessible.
- First default-peer statement includes a prefix list: The switch accepts all SA messages from the default peer whose originating RP is covered in the prefix list. The disposition of SA messages originating from other RPs is determined by subsequent default-peer statements.

The `no default-peer` and `default default-peer` commands remove the corresponding `default-peer` command from `running-config`.

**Command Mode**
- Router MSDP Peer Configuration
- Router MSDP Peer VRF Configuration

**Command Syntax**
```
default-peer [PREFIX]
no default-peer
default default-peer
```

**Parameters**

- `PREFIX`: List of RPs from the SA messages originate for which the default peer is valid.
  - `<no parameter>`: default peer is valid for SAs from all originating RPs.
  - `prefix-list list_name`: name of the prefix list that defines affected originating RP prefixes.

**Example**

These commands configure two MSDP peers and configure the peer at 10.5.2.2 as the default peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.6.2.2
switch(config-router-msdp-peer-10.6.2.2)#exit
switch(config-router-msdp)#peer 10.5.2.2
switch(config-router-msdp-peer-10.5.2.2)#default-peer
switch(config-router-msdp-peer-10.5.2.2)#
```
15.4.4  description (MSDP)

The `description` command associates descriptive text with the configuration-mode MSDP peer.

The `no description` and `default description` commands remove the text association from the specified peer.

**Command Mode**

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

**Command Syntax**

```plaintext
description  description_string
no description
default description
```

**Parameters**

- `description_string`  text string that is associated with the peer.

**Example**

These commands associate the string NORTH with the MSDP peer located at 10.4.4.12.

```plaintext
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
description NORTH
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```
15.4.4.5  disabled (MSDP)

The `disabled` command closes the peering session with the specified MSDP peer by terminating the TCP connection between the switch and the peer. The connection is not resumed until the shutdown command is removed from `running-config`.

The `no disabled` and `default disabled` commands establish an MSDP peering session with the specified peer by removing the corresponding `disabled` command from `running-config`.

**Command Mode**

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

**Command Syntax**

disabled

`no disabled`

default disabled

**Examples**

- This command closes the peering session with the MSDP peer at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#disabled
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
    State: Disabled
    Resets: 0
    Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```

- This command reopens the peering session with the peer at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#no disabled
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Description: NORTH
Connection status:
    State: Connect
    Resets: 0
    Connection Source: Loopback100 ( 10.6.8.6 )
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```
The `group-limit` command specifies the maximum number of Source-Active (SA) messages that the switch allows in the SA cache for a specified multicast group address.

SA messages have an expiration period of 90 seconds and remain in the SA cache until they expire. The switch does not accept SA messages for a group whose cache limit is reached until its cached messages start expiring.

The `no group-limit` and `default group-limit` command removes the maximum group limit for the specified prefix by removing the corresponding `group-limit` statement from `running-config`.

### Command Mode

- Router MSDP Configuration
- Router MSDP VRF Configuration

### Command Syntax

- `group-limit quantity source src_subnet`
- `no group-limit quantity source src_subnet`
- `default group-limit quantity source src_subnet`

### Parameters

- `quantity` maximum number of groups that can access the interface. Value ranges from 1 to 40000.
- `src_subnet` Source IPv4 subnet (CIDR or address-mask notation).

### Example

This command sets the maximum number of 1000 SAs for multicast group `10.13.15.8/29`.

```
switch(config)#router msdp
switch(config-router-msdp)#group-limit 1000 source 10.13.15.8/29
```
15.4.4.7  ip msdp rejected-limit

The `ip msdp rejected-limit` command specifies the maximum number of rejected Source-Active messages that the switch allows in the SA cache.

SA messages have an expiration period of 90 seconds. They remain in the SA cache during this time. The default limit of rejected SA messages that the switch can store is 40000.

The `no ip msdp rejected-limit` and `default ip msdp rejected-limit` commands restore the rejected SA limit of 40000 by removing the `ip msdp rejected-limit` statement from `running-config`.

**Command Mode**

- Router MSDP Configuration
- Router MSDP VRF Configuration

**Command Syntax**

```
ip msdp rejected-limit quantity
no ip msdp rejected-limit
default ip msdp rejected-limit
```

**Parameter**

- `quantity`: maximum rejected SA messages the SA cache can store. Value ranges from 0 to 40000.

**Example**

This command sets 5000 as the maximum number of rejected SAs that the SA cache can contain.

```
switch(config)#router msdp
switch(config-router-msdp)#ip msdp rejected-limit 5000
```
15.4.4.8 keepalive (MSDP)

The `keepalive` command configures the MSDP keep-alive and hold time intervals for a specified MSDP peer connection.

- Keep-alive time interval is the period between the transmission of consecutive keep-alive messages. The default keep-alive time interval is 60 seconds.
- Hold time interval is the period the switch waits for a KEEPALIVE or UPDATE message before it disables peering. The default hold time interval is 75 seconds.

The `no keepalive` and `default keepalive` commands restore the default keep-alive and hold time intervals for the specified MSDP peer connection by removing the corresponding `keepalive` command from `running-config`.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
keepalive keep_alive hold_time
no keepalive
default keepalive
```

Parameters

- `keep_alive` keep-alive period in seconds. Value ranges from 1 to 65535. Default value is 60.
- `hold_time` hold time in seconds. Value ranges from 1 to 65535. Default value is 75.

Note: The hold time interval must be longer than or equal to the keep-alive time interval.

Example

This command sets the keep-alive time to 45 seconds and the hold time to 80 seconds for the connection with the MSDP peer at 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#keepalive 45 80
switch(config-router-msdp-peer-10.4.4.12)#
```
15.4.4.9  local-interface

MSDP peering sessions are established over a TCP connection. The local-interface command specifies the interface through which the TCP connection is established with the configuration-mode MSDP peer. When the local-interface command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The no local-interface and default local-interface commands remove the corresponding local-interface command from running-config, returning selection of the connecting interface to the routing algorithm.

Command Mode
Router MSDP Peer Configuration
Router MSDP VRF Peer Configuration

Command Syntax

local-interface interface
no local-interface
default local-interface

Parameters

interface  local interface through which the TCP connection is established. Options include:

- ethernet e_num  Ethernet interface.
- loopback l_num  Loopback interface.
- management m_num  Management interface.
- port-channel p_num  Port-Channel Interface.
- vlan v_num  VLAN interface.
- vxlan vx_num  VXLAN interface.

Example

These commands assign an IP address to loopback interface 100, then establish the TCP peer session to the MSDP peer at 10.4.4.12 through the loopback in the default VRF.

```
switch(config)#interface loopback 100
switch(config-if-Lo100)#ip address 10.6.8.6/24
switch(config-if-Lo100)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#local-interface loopback 100
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Connect
   Resets: 0
   Connection Source: Loopback100 (10.6.8.6)
SAs accepted:
switch(config-router-msdp-peer-10.4.4.12)#
```
15.4.4.10  mesh-group

The `mesh-group` command configures the configuration-mode MSDP peer connection as an MSDP mesh group member. A peer can be assigned to multiple mesh groups. Multiple MSDP peers can be assigned to a common mesh group.

An MSDP mesh group is a network of MSDP speakers where each speaker directly connects to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

The `no mesh-group` and `default mesh-group` commands delete the configuration-mode peer connection from a mesh group by removing the corresponding `mesh-group` command from `running-config` when issued in Router MSDP Peer Configuration or Router MSDP Peer VRF Configuration Mode.

Note: To delete all configured connections from a specified mesh group, use the `no mesh-group` command in Router MSDP Configuration mode.

Command Mode

Router MSDP Configuration
Router MSDP Peer Configuration
Router MSDP Peer VRF Configuration

Command Syntax

```text
mesh-group group_name
no mesh-group group_name
default mesh-group group_name
```

Parameters

- `group_name` name of mesh group.

Related Command

`show msdp mesh-group`.

Examples

- These commands configure the MSDP peer connection to 10.1.1.14 as a member of the AREA-1 mesh group, then display members of mesh groups to which configured MSDP peers belong.

  ```text
  switch(config)#router msdp
  switch(config-router-msdp)#peer 10.1.1.14
  switch(config-router-msdp-peer-10.1.1.14)#mesh-group AREA-1
  switch(config-router-msdp-peer-10.1.1.14)#show msdp mesh-group
  Mesh Group: AREA-1
  10.1.1.14
  Mesh Group: tier_01
  10.24.18.13
  Mesh Group: tier_02
  10.26.101.18
  ```

- These commands delete all configured connections from the AREA-1 mesh group.

  ```text
  switch(config)#router msdp
  switch(config-router-msdp)#no mesh-group AREA-1
  switch(config-router-msdp)#
  ```
15.4.11 originator-id local-interface

The `originator-id local-interface` command configures an originator ID to replace the rendezvous point (RP) address in source-address (SA) messages that it originates as an MSDP speaker.

SA messages that an MSDP speaker originates contain the speaker’s rendezvous point (RP) address, as configured through PIM statements and processes. An originator ID is an alternative IPv4 address that a speaker uses in place of its RP address when advertising SA messages. This command configures the switch to use the specified interface’s IP address as the RP address in SA messages that it originates.

The `no originator-id local-interface` and `default originator-id local-interface` commands configure the switch to use its RP address in SA messages that it sends by removing the `originator-id local-interface` command from `running-config`.

Command Mode

Router MSDP Configuration

Router MSDP VRF Configuration

Command Syntax

`originator-id local-interface INTERFACE`

`no originator-id local-interface INTERFACE`

`default originator-id local-interface INTERFACE`

Parameters

`INTERFACE` Specifies the interface from which the IP address is derived. Options include:

- `ethernet e_num` Ethernet interface.
- `loopback l_num` Loopback interface.
- `management m_num` Management interface.
- `port-channel p_num` Port-Channel Interface.
- `vlan v_num` VLAN interface.
- `vxlan vx_num` VXLAN interface.

Example

These commands configure the switch to use the IP address assigned to loopback interface 100 as the RP address in SA messages that it originates.

```
switch(config)#router msdp
switch (config-router-msdp)#originator-id local-interface loopback 100
switch (config-router-msdp)#
```
15.4.12 peer

The `peer` command configures the specified address as an MSDP peer, enables MSDP on the switch if it was not previously enabled, and places the switch in Router MSDP Peer Configuration Mode for the specified peer.

The peering session with the device at the specified network is established over a TCP connection. The `local-interface` command can specify an interface through which the TCP connection is established. When the `local-interface` command is not used to specify an interface, the connection is established through an interface determined by existing routing algorithms.

The `no peer` and `default peer` commands remove the specified MSDP peer configuration by deleting the corresponding `peer` command from `running-config`. MSDP is disabled when the last `peer` command is removed.

**Command Mode**

Router MSDP Configuration

**Command Syntax**

`peer ip_address`

**Parameters**

`ip_address`   IP address of the MSDP peer to be configured.

**Commands Available in Router MSDP Peer Configuration Mode**

- `default-peer`
- `description (MSDP)`
- `disabled (MSDP)`
- `keepalive (MSDP)`
- `local-interface`
- `mesh-group`
- `sa-filter in`
- `sa-filter out`
- `sa-limit`

**Example**

These commands establish an MSDP peer relationship with the peer at 192.168.3.17 and place the switch in the Router MSDP Peer Configuration Mode for that peer.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 192.168.3.17
switch(config-router-msdp-peer-192.168.3.17)#
```
15.4.4.13  router msdp

The `router msdp` command places the switch in the router MSDP configuration mode, and allows to configure the global IP configuration commands and VRF commands in this mode.

The `no router msdp` and `default router msdp` commands removes the corresponding `router msdp` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
router msdp
no router msdp
default router msdp
```

**Example**

This command places the switch in the router MSDP configuration mode.

```
switch(config)#router msdp
switch(config-router-msdp)#
```

**Related Commands**

- connection retry interval

- description (MSDP)
- disabled (MSDP)
- group-limit
- ip msdp rejected-limit
- keepalive (MSDP)
- mesh-group
- originator-id local-interface
- peer
- sa-filter in
- sa-filter out
- sa-limit
15.4.4.14  sa-filter in

The `sa-filter in` command assigns an IP access control list (ACL) as a filter for inbound Source-
Active (SA) messages from the configuration-mode MSDP peer connection. The switch only accepts
SA messages from the peer that are accepted by the assigned ACL. The switch accepts all SA
messages from the peer when an ACL is not assigned as an inbound filter.

Only one ACL can be assigned as an inbound filter to an MSDP peer. Any subsequent `sa-filter
in` commands for the peer replace the existing command.

The `no sa-filter in` and `default sa-filter in` commands remove the ACL assignment as
an inbound filter by removing the corresponding `sa-filter in` command from `running-config`.

Command Mode
Router MSDP Peer Configuration
Router MSDP Peer VRF Configuration

Command Syntax
`sa-filter in list list_name`
`no sa-filter in`
`default sa-filter in`

Parameters
- `peer_id` MSDP peer address (IPv4 address).
- `list_name` name of ACL that filters SA messages.

Related Command
`sa-filter out`

Guideline
The command accepts standard and extended ACLs. The address field in a standard ACL filters an SA
message on its group address.

Example
These commands create an IP ACL named LIST-IN as the inbound SA message filter for the MSDP
peer connection to 10.4.4.12. The ACL permits SAs from the multicast group 239.14.4.2/28.

```
switch(config)#ip access-list LIST-IN
switch(config-acl-LIST-IN)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-IN)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter in list LIST-IN
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
Connection status:
   State: Listen
   Connection Source: Loopback100 (10.6.8.6)
SA Filtering:
   Input Filter: LIST-IN
```
Multicast

15.4.4.15  sa-filter out

The `sa-filter out` command assigns an IP access control list (ACL) as a filter for outbound Source-Active (SA) messages to the configuration-mode MSDP peer connection, after which the switch only sends SA messages to the peer that are accepted by the assigned ACL. The switch sends all SA messages to the peer when an ACL is not assigned as an output filter to the peer.

Only one ACL can be assigned as an outbound filter to an MSDP peer. Any subsequent `sa-filter out` commands for the peer replace the existing command.

The `no sa-filter out` and `default sa-filter out` commands remove the ACL assignment as an outbound filter by removing the corresponding `sa-filter out` command from `running-config`.

Command Mode

Router MSDP Peer Configuration

Router MSDP Peer VRF Configuration

Command Syntax

```
sa-filter out list list_name
no sa-filter out
default sa-filter out
```

Parameters

- `peer_id` MSDP peer address (IPv4 address).
- `list_name` name of ACL that filters SA messages.

Related Command

`sa-filter in` assigns an IP ACL to filter inbound SA messages from the MSDP peer being configured.

Guidelines

The command accepts standard and extended ACLs. The address field in a standard ACLs filters an SA message on its group address.

Example

These commands assign the IP ACL named LIST-OUT as the outbound SA message filter for the MSDP peer connection to 10.4.4.12.

```
switch(config)#router msdp
switch(config-router-msdp)#ip access-list LIST-OUT
switch(config-acl-LIST-OUT)#permit ip any 239.14.4.2/28
switch(config-acl-LIST-OUT)#exit
switch(config)#router msdp
switch(config-router-msdp)#peer 10.4.4.12
switch(config-router-msdp-peer-10.4.4.12)#sa-filter out list LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#show ip msdp peer
MSDP Peer 10.4.4.12
  Connection status:
    State: Listen
    Connection Source: Loopback100 ( 10.6.8.6 )
    SA Filtering:
    Output Filter: LIST-OUT
switch(config-router-msdp-peer-10.4.4.12)#
```
15.4.16  sa-limit

The **sa-limit** command specifies the maximum number of Source-Active messages from a specified MSDP peer that the switch allows in the SA cache. SA messages have an expiration period of 90 seconds, during which time they remain in the SA cache. The switch does not accept SA messages from a peer after the peer’s SA limit is reached. By default, The limit to the number of SA messages that the switch can store from a specified peer is 40000, by default.

The **no sa-limit** and **default sa-limit** commands restore the SA limit of 40000 for the specified MSDP peer by removing the corresponding sa-limit statement from **running-config**.

**Command Mode**

Router MSDP Peer Configuration

**Command Syntax**

```
sa-limit quantity
no sa-limit
default sa-limit
```

**Parameters**

- **peer_id**  MSDP peer (IPv4 address).
- **quantity**  maximum number of SA messages that the switch can store. Value ranges from 0 to 40000.

**Example**

This command sets the SA limit of 500 for the MSDP peer at 10.1.1.5.

```
switch(config)#router msdp
switch(config-router-msdp)#peer 10.1.1.5
switch(config-router-msdp-peer-10.1.1.5)#sa-limit 500
switch(config-router-msdp-peer-10.1.1.5)#
```
15.4.17  show ip msdp peer

The `show ip msdp peer` command displays information about specified MSDP peers. The command includes an optional parameter for displaying SAs accepted from the peer.

**Command Mode**

**EXEC Command Syntax**

```
show ip msdp peer [PEER_ADDR][SA_ACCEPT]
```

**Parameters**

- **PEER_ADDR**  Peers for which command displays information.
  - `<no parameter>`  All peers configured on the switch.
  - `ipv4_addr`  Address of specified MSDP peer.
- **SA_ACCEPT**  Command displays SAs accepted from the specified peers.
  - `<no parameter>`  Accepted SAs are not displayed.
  - `accepted-sas`  Accepted SAs are displayed.

**Example**

This command displays MSDP information concerning the peer located at 10.2.42.4, including SAs that the switch accepted from this peer.

```
switch(config)#show ip msdp peer 10.2.42.4 accepted-sas
MSDP Peer 10.2.42.4
Connection status:
  State: Up
  Connection Source: Loopback4 ( 10.2.43.4 )
SA Filtering:
Input Filter: allow-multicast-for-msdp
Output Filter: allow-multicast-for-msdp
SAs accepted:
  (10.62.79.30, 234.1.4.2), RP 10.2.42.4
  (10.61.79.29, 234.1.4.1), RP 10.2.42.4
  (10.62.79.30, 234.1.4.1), RP 10.2.42.4
```
**15.4.4.18  show ip msdp pim sa-cache**

The `show ip msdp pim sa-cache` command displays the SA cache for the local PIM domain configured on the switch. An SA cache is a table of Source-Active messages that are generated or accepted by the PIM domain.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp pim sa-cache`

**Example**

This command displays the SA cache for the local PIM domain.

```
switch(config)#show ip msdp pim sa-cache
MSDP Source Active Messages for local Pim RP
(10.51.71.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.26, 234.1.4.1), RP 10.2.43.4
(10.51.71.23, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.1), RP 10.2.43.4
(10.51.79.23, 234.1.4.1), RP 10.2.43.4
(10.20.91.24, 234.1.4.2), RP 10.2.43.4
(10.20.91.21, 234.1.4.2), RP 10.2.43.4
(10.20.91.26, 234.1.4.2), RP 10.2.43.4
(10.20.91.24, 234.1.4.1), RP 10.2.43.4
```
The `show ip msdp sa-cache` command displays contents of the Source-Active (SA) message cache. The command provides these filter options for displaying partial cache contents:

- multicast group address: multicast group
- source address and group address

The command can also display unexpired SAs that were rejected by ACL filters or cache limit exceeded conditions.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp sa-cache [ADDRESS_FILTER][CONTENTS]`

**Parameters**

- **ADDRESS_FILTER**  IPv4 address used to filter SA messages.
  - `<no parameter>`  All SA messages.
  - `grp_addr`  Multicast group address (IPv4 address).
  - `src_addr grp_addr`  Source and multicast group addresses (two IPv4 addresses).

  `grp_addr` must be a valid multicast address.

- **CONTENTS**  type of SAs that the command displays.
  - `<no parameter>`  Displays contents of SA Cache.
  - `rejected`  Displays rejected SAs in addition to the SA cache contents.

**Example**

This command displays the contents of the SA message cache.

```markdown
switch(config)#show ip msdp sa-cache
MSDP Source Active Cache
(10.61.71.29, 234.1.4.2), RP 10.5.29.4, heard from 10.5.29.4

```
The `show ip msdp sanity` command performs a consistency check between the multicast routing table and the MSDP Source-Address (SA) caches. When the command detects inconsistencies, it displays the cache entries that are not in the table.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp sanity`

**Examples**

- This command displays a sanity check that detects no inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
```

- This command displays inconsistencies between the SA cache and the multicast routing table.

```
switch(config)#show ip msdp sanity
PIM SA cache entries not in the MRT
Msdp-learnt MRT entries not in the SA cache
SA cache entries not in the MRT
(192.168.3.8, 224.1.154.1)
(192.168.3.35, 224.1.167.1)
(192.168.3.16, 224.1.226.1)
(192.168.3.19, 224.1.246.1)
(192.168.3.17, 224.1.204.1)
(192.168.3.12, 224.1.182.1)
(192.168.3.33, 224.1.150.1)
(192.168.3.26, 224.1.198.1)
(192.168.3.33, 224.1.195.1)
(192.168.3.4, 224.1.246.1)
(192.168.3.37, 224.1.188.1)
(192.168.3.12, 224.1.245.1)
(192.168.3.31, 224.1.206.1)
(192.168.3.35, 224.1.178.1)
(192.168.3.6, 224.1.155.1)
May-Notify-MSDP entries not in the PIM SA cache
(need not be an error condition)
4.1), RP 10.2.42.4
```
15.4.4.21  show ip msdp summary

The **show ip msdp summary** command displays a list of peer addresses, the operational status of the peer, and the number of Source-Active messages in the SA cache from that peer.

**Command Mode**

EXEC

**Command Syntax**

`show ip msdp summary`

**Example**

This command displays the configured peers, the status of the peers, and the number of SA message received from those peers.

```
switch(config)#show ip msdp summary
MSDP Peer Status Summary
Peer Address  State  SA Count
192.168.3.18  Up   0
192.168.3.16  Up   0
192.168.3.37  Listen  0
192.168.3.46  Up   0
192.168.3.47  Up   0
```
15.4.22  show msdp mesh-group

The show msdp mesh-group command displays the mesh group membership of MSDP peers that are configured on the switch. An MSDP mesh group is a network of MSDP speakers where each speaker is directly connected to every other speaker. The switch does not forward Source-Active (SA) messages that it receives from a mesh group peer to other peers of the same group.

Command Mode
EXEC

Command Syntax
show msdp mesh-group

Related Command
mesh-group configures the MSDP peer connection as an MSDP mesh group member.

Example
This command displays the mesh group membership of configured MSDP peers.

switch(config)#show msdp mesh-group
Mesh Group: tier_01
   10.24.18.13
Mesh Group: tier_02
   10.26.101.18
15.4.23  show msdp rpf-peer

The `show msdp rpf-peer` command displays MSDP information for the peer from which the switch accepts SA messages for a specified rendezvous point (RP).

The switch examines the BGP routing table to determine the next hop peer toward the originating RP of an SA message. This next hop peer is the reverse path forwarding (RPF) peer. Because the switch receives SA messages from the RPF peer, it forwards the message to all other MSDP peers. The switch rejects identical SA messages that it receives from a non-RPF peer.

**Command Mode**
EXEC

**Command Syntax**

`show msdp rpf-peer rp_addr`

**Parameter**

`rp_addr` PIM RP IPv4 address.

**Example**

This command displays MSDP information for the peer from which the switch accepts SA messages for the RP at 10.5.29.4.

```
switch(config)#show msdp rpf-peer 10.5.29.4
Rpf Peer is 10.5.29.4 for RP 10.5.29.4
```
• Traffic classes 2 and 3 for AVB traffic
• Traffic shaping on egress ports

These AVB features are not available on Arista switches:
• MSRP protocol on LAGs
• MSRP co-ordination with gPTP; streams are allowed even when gPTP is not in sync
• MMRP
• Signaling message support in gPTP
• Running peer delay mechanism on STP blocked ports
• Grandmaster-specific state machines (gPTP)

15.5.2 AVB Protocols

This section describes supported AVB protocols:
• gPTP
• MVRP
• MSRP
• MRP

15.5.2.1 gPTP

Generalized Precision Time Protocol (gPTP) is a network time synchronization standard for bridged Local Area Networks based on the IEEE 1588v2 Precision Time Protocol and supports the AVB protocol standards.

Time synchronization in a gPTP domain is conducted the same way as in a PTP 1588 domain. A grandmaster is selected through the best grand master clock algorithm and distributes timing synchronization information to all directly attached peers. This information is propagated across the network to provide a common time reference to all Audio and Video end stations.

15.5.2.2 MVRP

Multiple VLAN Registration Protocol (MVRP) is an application of Multiple Registration Protocol used by AVB endpoints to dynamically register and unregister VLANs on an interface.

When an interface wishes to join a VLAN advertised by an MSRP talker (to receive a stream), MVRP sends a Join message. On receiving the Join message, the interface is added to the VLAN. If the VLAN does not already exist, MVRP dynamically creates the VLAN and propagates it through the network.

MVRP events post Syslog messages, with the severity level of INFO for each message.
• MVRP_VLAN_JOIN
  MVRP VLAN Join received/transmitted on an interface.
• MVRP_VLAN_LV
  MVRP VLAN Leave received/transmitted on an interface.
• MVRP_ERROR
  MVRP Join was discarded due to an error.

15.5.2.3 MSRP

Multiple Stream Registration Protocol (MSRP) is a signaling protocol that allows end stations (nodes) to reserve network resources and ensure QoS for communicating with other end stations.

MSRP nodes are specified as talkers or listeners:
• Talker nodes transmit multimedia streams to other nodes in the AVB network.
• Listener nodes receive multimedia streams from the AVB talker nodes.

MSRP is implemented by the switch on individual interfaces. MSRP is active when it is enabled on at least one interface, and stopped when it is disabled on all interfaces. MSRP uses Multiple Registration Protocol (MRP) to facilitate attribute registrations and distribution across connected end points in a LAN environment.

MSRP events post Syslog messages, with the severity level of INFO for each message.

• **MSRP_SR_CLASS_TRANSITION**
  MSRP SR Class state transition occurred on an interface.

• **MSRP_TALKER_ADV_JOIN**
  Talker Advertise Join message for a stream was transmitted/received on an interface.

• **MSRP_TALKER_FAIL_JOIN**
  Talker Failed Join message for a stream was transmitted/received on an interface.

• **MSRP_LISTENER_JOIN**
  Listener Join message for a stream was transmitted/received on an interface.

• **MSRP_DOMAIN_JOIN**
  Domain Join message was transmitted/received on an interface.

• **MSRP_TALKER_ADV_LV**
  Talker Advertise Leave message for a stream was transmitted/received on an interface.

• **MSRP_TALKER_FAIL_LV**
  Talker Failed Leave message for a stream was transmitted/received on an interface.

• **MSRP_LISTENER_LV**
  Listener Leave message for a stream was transmitted/received on an interface.

• **MSRP_DOMAIN_LV**
  Domain Leave message was transmitted/received on an interface.

• **MSRP_BW_ALLOC_SUCCESS**
  MSRP Bandwidth was allocated for a listener on an interface.

• **MSRP_BW_ALLOC_FAIL**
  MSRP Bandwidth could not be allocated for a listener on an interface.

• **MSRP_BW_DEALLOC**
  MSRP Bandwidth was de-allocated for a listener on an interface.

• **MSRP_ERROR**
  MSRP Join was discarded because of an error.

### 15.5.2.4 MRP

Multiple Registration Protocol (MRP) protocol includes MSRP and MVRP, and allows participants in an MRP application to register attributes with participants in a Bridged Local Area Network (BLAN).

### 15.5.3 AVB Configuration

This section describes the AVB configuration:

• **Enabling gPTP**
• **Enabling MSRP**
• **Displaying MSRP Configuration and Status**
• Enabling MVRP
• Displaying MVRP Configuration and Status

15.5.3.1 Enabling gPTP

Configure gPTP on the switch though the `ptp mode gptp` command. PTP is enabled on individual interfaces with the `ptp enable` command.

**Example**

- These commands configure gPTP on the switch and enable PTP on Ethernet interfaces 41-45.

```plaintext
switch(config)#ptp mode gptp
switch(config)#interface ethernet 41-45
switch(config-if-Et41-45)#ptp enable
switch(config)#show running-config

<-------OUTPUT OMITTED FROM EXAMPLE-------->
!
ptp mode gptp
!
<-------OUTPUT OMITTED FROM EXAMPLE-------->
end
switch(config-if-Et41-45)#show active
interface Ethernet41
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet42
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet43
  speed forced 10000full
  msrp
  ptp enable
interface Ethernet44
  speed forced 10000full
  ptp enable
interface Ethernet45
  ptp enable
switch(config-if-Et41-45)#
```

15.5.3.2 Enabling MSRP

MSRP is enabled on an interface with the `msrp` command.

**Example**

- These commands enable MSRP on Ethernet interfaces 41-43.

```plaintext
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#msrp
switch(config-if-Et41-43)#show active
interface Ethernet41
  speed forced 10000full
  msrp
interface Ethernet42
  speed forced 10000full
  msrp
interface Ethernet43
```
15.5.3.3 Displaying MSRP Configuration and Status

MSRP configuration information and status is displayed with the `show msrp` command.

Example

- This command displays the MSRP status for Ethernet interfaces 41-43.

```
switch(config)# show msrp interfaces ethernet 41-43
```

Stream data is available for the talker and listener. The `show msrp interfaces` command displays the status and configuration information for each stream.

Examples

- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

```
switch(config)# show msrp interfaces ethernet 1-2
```

```
This command displays data for talker station streams on Ethernet interfaces 1 and 2.

```
switch(config)# show msrp interfaces ethernet 1-2 talkers
Legend
-----
Adv : Talker Advertise          Fail : Talker Fail

<table>
<thead>
<tr>

<td>Adv</td>
<td>Rx</td>
<td>7</td>
</tr>
</tbody>
</table>
```

15.5.3.4 Enabling MVRP

MVRP is disabled by default. To enable MVRP on an interface, use the `mvrp` command. MVRP is enabled globally if it is enabled on at least one interface.

Example

- These commands enable MVRP on Ethernet interface 34.

```
switch(config)# interface ethernet 34
switch(config-if-Et34)# mvrp
switch(config-if-Et34)#
```

15.5.3.5 Displaying MVRP Configuration and Status

MVRP configuration information and status are displayed with the `show mvrp` command.

Example

- This command displays the MVRP status for Ethernet interfaces 30 through 40.

```
switch(config)# show mvrp interfaces Ethernet 30-40
MVRP Global Status : Enabled

<table>
<thead>
<tr>

switch(config)#
15.5.4 AVB Command Descriptions

MSRP Commands
- msrp
- msrp streams load-file
- show msrp
- show msrp interfaces
- show msrp streams

MRP Commands
- mrp leave-all-timer
- mrp leave-timer

MVRP Commands
- show mvrp
**15.5.4.1 mrp leave-all-timer**

The `mrp leave-all-timer` command specifies the mrp leave all timer interval for the configuration mode interface.

When starting MRP, a participant starts its LeaveAll timer. Upon timer expiry, it sends a LeaveAll message and restarts its timer. When other participants receive the message, they register their attributes and restart their leave-all timers.

The default leave-all timer interval is a randomly selected value from 10 to 15 seconds. Under normal conditions, this value should not be adjusted.

The `no mrp leave-all-timer` and `default mrp leave-all-timer` commands restore the default leave-all timer interval on the configuration mode interface by removing the corresponding `mrp leave-all-timer` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mrp leave-all-timer period
mrp leave-all-timer
default mrp leave-all-timer
no mrp leave-all-timer
```

**Parameters**

- `period` leave all timer interval (seconds). Values range from 10 to 60. Default value is a randomly selected value from 10 to 15.

**Example**

This command sets the MRP leave-all timer interval on Ethernet interface 17 to twelve seconds.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#mrp leave-all-timer 12
switch(config-if-Et17)#
```
15.5.4.2 mrp leave-timer

The leave-timer controls the deregistration of attributes. If an MRP participant needs other participants to unregister their attributes, it sends a Leave message. When receiving a Leave message, the Leave-timer starts and unregisters the attributes if it doesn't receive Join messages for the attributes before the Leave-timer expires.

The `mrp leave-timer` command specifies the mrp leave-timer interval for the configuration mode interface. The default leave-timer interval is 0.6 seconds. Under normal operation conditions, this value should not be adjusted.

The `no mrp leave-timer` and `default mrp leave-timer` commands restore the default leave-timer interval of 0.6 seconds on the configuration mode interface by removing the corresponding `mrp leave-timer` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

- `mrp leave-timer period`
- `no mrp leave-timer`
- `default mrp leave-timer`

**Parameters**

- `period` leave all timer interval (seconds). Values range from 10 to 60. Default value is a randomly selected value from 10 to 15.

**Example**

- This command sets the MRP leave timer interval on Ethernet interface 17 to 0.8 seconds.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#mrp leave-timer 12
switch(config-if-Et17)#
```
15.5.4.3  msrp streams load-file

The load-file for MSRP streams provides a file that contains an alias that can be substituted in the name (stream-id) of a string.

The `msrp streams load-file` command allows users to include a line in the file (example: 0102.0304.0506 XYZW4 or 0102.0304 XYZW5) that causes the bytes to be replaced with the accompanying string in `show msrp streams` commands.

The `no msrp streams load-file` and `default msrp streams load-file` commands remove the alias assignment by removing the corresponding `msrp streams load-file` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
msrp streams load-file [FILE TYPE]
no msrp streams load-file
default msrp streams load-file
```

**Parameters**

- **FILE TYPE** The options include:
  - `certificate`: device name, directory, or file name
  - `extension`: device name, directory, or file name
  - `file`: device name, directory, or file name
  - `flash`: device name, directory, or file name
  - `ftp`: device name, directory, or file name
  - `http`: device name, directory, or file name
  - `https`: device name, directory, or file name
  - `scp`: device name, directory, or file name
  - `sftp`: device name, directory, or file name
  - `sslkey`: device name, directory, or file name
  - `system`: device name, directory, or file name
  - `terminal`: device name, directory, or file name
  - `tftp`: device name, directory, or file name
  - `usb1`: device name, directory, or file name

- **Example**

This command indicates that the file named file1 contains the alias names that is used in MSRP stream names.

```
switch(config)#msrp streams load-file file1
switch(config)#
```
MSRP enables Multiple Stream Registration Protocol (MSRP), which is a signaling protocol that provides nodes with the ability to reserve network resources to ensure Quality of Service (QoS) between talker and listener endpoints. The Stream Reservation Protocol (SRP) utilizes MSRP to reserve bandwidth for data streams, and configure a complete path between endpoints.

The `msrp` command enables MSRP on the configuration mode interface. If MSRP was not previously enabled on any interface, the MSRP agent is launched by this command.

The `no msrp` and `default msrp` commands disable MSRP on the configuration mode interface, and removes the corresponding `msrp` command from `running-config`. The command stops the MSRP agent when MSRP is no longer enabled on any interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
msrp
no msrp
default msrp
```

**Example**

These commands enable MSRP on Ethernet interface 3/3/3. Because it was not previously enabled on any other interface, the command launches the MSRP agent.

```
switch(config)#interface ethernet 3/3/3
switch(config-if-Et3/3/3)#msrp
Launching MSRP Agent
switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
  msrp
switch(config-if-Et3/3/3)#
```

These commands disable the MSRP agent on Ethernet interface 3/3/3. Because it is not enabled on any other interface, the command stops the MSRP agent.

```
switch(config-if-Et3/3/3)#no msrp
Stopping MSRP agent
switch(config-if-Et3/3/3)#show active
  interface Ethernet3/3/3
switch(config-if-Et3/3/3)#msrp
```
15.5.4.5 show msrp interfaces

The show msrp interfaces command displays station stream information for the specified station type, interfaces and streams.

Command Mode
EXEC

Command Syntax
show msrp interfaces [INTERFACE_NAME] STATION_TYPE_NAME [STREAMS]

Parameters
- INTERFACE_NAME Interface type and number. Values include:
  - <no parameter> all Ethernet interfaces.
  - ethernet e_range Ethernet interface list.
- STATION_TYPE Endpoint type. Values include:
  - talker Command displays data for talker station streams.
  - listeners Command displays data for listener station streams.
  - streams Command displays data for talker and listener station streams.
- STREAMS Streams for which command displays information. Options include:
  - <no parameter> all streams.
  - stream-id hex_string specifies the stream command for which command displays information.

Valid e_range formats include number, range, or comma-delimited list of numbers and ranges.

Valid hex_string formats include <H>, <H.H>, <H.H.H>, or <H.H.H.H>, where H is a four-digit hex number that ranges from 0 to FFFF.

Example
- This command displays data for listener station streams on Ethernet interfaces 1 and 2.

```plaintext
switch(config)#show msrp interfaces ethernet 1-2 listeners
Legend
-------
AskFail : Listener Asking Failed    Rdy     : Listener Ready
RdyFail : Listener Ready Failed

switch(config)#
15.5.4.6 show msrp streams

The `show msrp streams` command displays configuration and status information on the specified MSRP streams.

Command Mode
EXEC

Command Syntax
`show msrp streams [STREAM_NAME] [INFO_LEVEL]`

Parameters
- **STREAMS** Streams for which command displays information. Options include:
  - `<no parameter>` all streams.
  - **stream-id** *hex_string* specifies the stream command for which command displays information.

Valid *hex_string* formats include `<H>`, `<H.H>`, `<H.H.H>`, or `<H.H.H.H>`, where H is a four-digit hex number that ranges from 0 to FFFF.

- **INFO_LEVEL** type of information that the command displays. Options include:
  - `<no parameter>` command displays stream identification information.
  - **detail** command displays identification and transmission characteristics.
  - **propagation** command displays ingress and egress port information.

Examples
- This command displays stream identification information.

```
switch(config)#show msrp interfaces streams
Legend -----------------------------
Adv   : Talker Advertise          Fail : Talker Fail

15.5.4.7  show msrp

The `show msrp` command displays MSRP operational information for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

`show MVRP [ INTERFACE_NAME ]`

**Parameters**

- **INTERFACE_NAME** Interface type and number. Values include
  - `<no parameter>` all Ethernet interfaces.
  - `interfaces ethernet e_range` Ethernet interface list.

  Valid `e_range` formats include number, range, or comma-delimited list of numbers and ranges.

**Example**

- This command displays the MSRP status for Ethernet interfaces 41 through 43.

```
switch(config)#show msrp interfaces ethernet 41-43

switch(config)#
```
Chapter 16

Virtual Extensible LANs (VXLANs)

This chapter describes Arista’s Virtual Extensible LAN (VXLAN) implementation. Sections in this chapter include:

- VXLAN Introduction
- VXLAN Description
- VXLAN Configuration
- VXLAN Command Descriptions

16.1 VXLAN Introduction

Virtual Extensible LAN (VXLAN) is a networking technology that encapsulates MAC-based Layer 2 Ethernet frames within Layer 3 UDP packets to aggregate and tunnel multiple layer 2 networks across a Layer 3 infrastructure. VXLAN scales up to 16 million logical networks and supports layer 2 adjacency across IP networks. Multicast transmission architecture is used for broadcast, multicast, and unknown unicast traffic.

For a list of VXLAN feature support in a specific EOS release, consult the appropriate release notes here: https://www.arista.com/en/support/software-download.

For a list of VXLAN feature support by platform in the latest EOS release, see https://www.arista.com/en/support/product-documentation/supported-features

Note: VXLAN and NAT cannot co-exist.

16.2 VXLAN Description

These sections describe VXLAN architecture, the data objects that comprise a VXLAN network, and process of bridging packets through a VXLAN network.

- VXLAN Architecture
- VXLAN Processes
- Multicast and Broadcast over VXLAN
- VXLAN Gateway
- VXLAN and MLAG
- VXLAN Bridging and Routing Support
- Data Structures

16.2.1 VXLAN Architecture

The VXLAN architecture extends an L2 network by connecting VLANs from multiple hosts through UDP tunnels called VXLAN segments. VXLAN segments are identified by a 24-bit virtual network identifier (VNI). Within a host, each VLAN whose network is extended to other hosts is associated with a VNI. An extended L2 network comprises the devices attached to VLANs from all hosts that are on VLANs that are associated with the same VNI.

The following figure displays the data objects that comprise a VXLAN implementation on a local host.
Figure 65: VXLAN Architecture

- **VXLAN Tunnel End Point (VTEP):** a host with at least one VXLAN Tunnel Interface (VTI).
- **VXLAN Tunnel Interface (VTI):** a switchport linked to a UDP socket that is shared with VLANs on various hosts. Packets bridged from a VLAN to the VTI are sent out the UDP socket with a VXLAN header. Packets arriving on the VTI through the UDP socket are demuxed to VLANs for bridging.
- **Virtual Network Identifier (VNI):** a 24-bit number that distinguishes between the VLANs carried on a VTI. It facilitates the multiplexing of several VLANs over a single VTI.

VNI values can be expressed in digital or dotted decimal formats. VNI values range from 1 to 16777215 or from 0.0.1 to 255.255.255.

The network in the figure above has the following assignments:

- VTEP IP address of 10.10.1.1
- UDP port of 4789
- One VTI that supports three VXLAN segments (UDP tunnels): VNI 200, VNI 2000, and VNI 20000
- Five VLANs, of which three VLANs can communicate with remote devices over Layer 2.

16.2.2 VXLAN Gateway

A VXLAN gateway is a service that exchanges VXLAN data and packets with devices connected to different network segments. VXLAN traffic must pass through a VXLAN gateway to access services on physical devices in a distant network.

A VXLAN gateway requires the following information:

- An IP address that is designated as the VXLAN interface source.
- VLAN to VNI mapping.
- VTEP list for each VNI.
- A method for handling broadcast, unknown unicast, and multicast (BUM) packets.

Arista switches manually perform VXLAN gateway services. The switch connects to VXLAN gateways that serve other network segments. MAC address learning is performed in hardware from inbound VXLAN packets.
16.2.3 VXLAN Processes

When a packet enters a VLAN from a member (ingress) port, the VLAN learns the source address by adding an entry to the MAC address table that associates the source to the ingress-port. The VLAN then searches the table for destination address. If the MAC address table lists the address, the packet is sent out the corresponding port. If the MAC address table does not lists the address, the packet is flooded to all ports except the ingress port.

VXLANs extend VLANs through the addition of a VXLAN address table that correlates remote MAC addresses to their port and resident host IP address. Packets that are destined to a remote device are sent to the VXLAN tunnel interface (VTI), which is the switchport that is linked to the UDP socket. The packet is encapsulated with a VXLAN header which includes the VNI associated with the VLAN and the IP mapping of the destination host. The packet is sent through a UDP socket to the destination VTEP IP. The VTI on the remote host extracts the original packet and bridges it to the VLAN associated with the VNI on the remote host.

UDP port 4789 is recognized as the VXLAN socket and listed as the destination port on the UDP packets. The UDP source port field is filled with a hash of the inner header to facilitate load balancing.

![Figure 66: XLAN Implementation](image)

The figure above displays a configuration that includes three VTEPs. The VXLAN defines three inter-host L2 networks. The VLANs that comprise the networks include:

- VNI 200: VTEP 10.20.2.2: VLAN 1200 and VTEP 10.30.3.3: VLAN 200
- VNI 2000: VTEP 10.10.1.1: VLAN 300, VTEP 10.20.2.2: VLAN 1400, and VTEP 10.30.3.3: VLAN 300
- VNI 20000: VTEP 10.10.1.1: VLAN 200, and VTEP 10.20.2.2: VLAN 1600

16.2.4 Multicast and Broadcast over VXLAN

These sections describe multicast and broadcast over VXLANs. Multicast packet flooding describes broadcast and multicast transmission by associating a multicast group to a VTI through a configuration command.
Head-end Replication (HER) optimizes flooding of inter VTEP broadcast, unknown unicast and broadcast (BUM) traffic by using hardware and flood lists to perform replication on the supported platform.

- Multicast Packet Flooding
- Head-end Replication

16.2.4.1 Multicast Packet Flooding
Multicast packet flooding is supported with VXLAN bridging without MLAG. A VTI is associated with a multicast group through a configuration command.

VXLAN and Broadcast
When a VLAN receives or sends a broadcast packet the VTI is treated as a bridging domain L2 interface. The packet is sent from this interface on the multicast group associated with the VTI. The VTIs on remote VTEPs that receive this packet extract the original packet, which is then handled by the VLAN associated with the packet’s VNI. The VLAN floods the packet, excluding the VTI. When the broadcast results in a response, the resulting packet can be unicast back to the originating VTEP because the VXLAN address table obtained the host MAC to VTEP association from the broadcast packet.

VXLAN and Multicast
A VTI is treated as an L2 interface in the VLAN for handling multicast traffic, which is mapped from the VLAN to the multicast group associated with the VTI. All VTEPs join the configured multicast group for inter-VTEP communication within a VXLAN segment; this multicast group is independent of any other multicast groups that the hosts in the VLAN join.

The IP address space for the inter-host VXLAN communication may be sourced from a different VRF than the address space of the hosts in the VLAN. The multicast group for inter-VTEP transmissions must not be used for other purposes by any device in the VXLAN segment space.

16.2.4.2 Head-end Replication
Head-end replication uses a flood list to support broadcast, unknown unicast, and multicast (BUM) traffic over VXLAN. The flood list specifies a list of remote VTEPs. The switch replicates BUM data locally for bridging across the remote VTEPs specified by the flood list. This data flooding facilitates remote MAC address learning by forwarding data with unknown MAC addresses.

Head-end replication is required for VXLAN routing and to support VXLANs over MLAG.

16.2.5 VXLAN and MLAG
VXLAN over MLAG provides redundancy in hardware VTEPs. VTI configuration must be identical on each MLAG peer for them to act as a single VTEP. This also prevents the remote MAC from flapping between the remote VTEPs by ensuring that the rest of the network sees a host that is connected to the MLAG interface as residing behind a single VTEP.

Differences between VXLAN bridging and routing implementations over MLAG are applicable for the DCS-7050X series platform.

- VXLAN routing recirculates a packet twice, with the first iteration performing the routing action involving an L2 header rewrite, and the second recirculation performing VXLAN encap and decap operations. Recirculation is achieved by MAC loopback on dedicated loopback interfaces.
- The configuration for VXLAN routing on an MLAG VTEP includes separate Recirc-Channel configuration on both peers. The virtual IP, virtual MAC, and virtual VARP VTEP IP addresses are identical on both peers.
Virtual Extensible LANs (VXLANs)

The following VTI elements must be configured identically on both MLAG peers:

- VLAN-VNI mappings
- VTEP IP address of the source loopback interface
- Flood VTEP list used for head-end replication

If OSPF is also in use, configure the OSPF router ID manually to prevent the switch from using the common VTEP IP address as the router ID.

The following rules are observed by MLAG switches so that they behave as a single VXLAN VTEP:

- Only the MLAG peer that receives a packet performs VXLAN encapsulation on it.
- Packets are not VXLAN encapsulated if they are received from the peer link.
- If a packet is decapsulated and sent over the peer link, it should not be flooded to active MLAG interfaces.
- If a packet is sent over the peer link to the CPU, it is not head-end replicated to other remote VTEPs.
- If a packet's destination is the VTEP IP address, it is terminated by the MLAG peer that receives it.

**Example**

These commands complete the configuration required for a VXLAN routing deployment.

```bash
switch(config)#interface Vxlan1
switch(config-if-Vx1)#vxlan source-interface Loopback0
switch(config-if-Vx1)#vxlan udp-port 4789
switch(config-if-Vx1)#vxlan vlan 2417 vni 8358534
switch(config-if-Vx1)#vxlan flood vtep 1.0.1.1 1.0.2.1
switch(config-if-Vx1)#interface Vlan2417
switch(config-if-Vl2417)#ip address 1.0.4.1/24
switch(config-if-Vl2417)#interface Loopback0
switch(config-if-Lo0)#ip address 1.0.1.1/32
switch(config-if-Lo0)#ip routing

switch(config)#interface Recirc-Channel627
switch(config-if-Re627)#switchport recirculation features vxlan
switch(config-if-Re627)#interface Ethernet 1
switch(config-if-Et1)#traffic-loopback source system device mac
switch(config-if-Et1)#channel-group recirculation 627
switch(config-if-Et1)#exit

switch(config)#interface Ethernet 2
switch(config-if-Et2)#traffic-loopback source system device mac
switch(config-if-Et2)#channel-group recirculation 627
switch(config-if-Et2)#
```

**Configuring Unconnected Ethernet Interfaces for Recirculation**

On systems where bandwidth is not fully used by the front panel ports, unused bandwidth is used for recirculation.

The following example is applicable to the DCS-7050X series platform.

**Example**

These commands expose unconnected Ethernet interfaces which are used for recirculation, in order to use them to replace or use along with front panel Ethernet interfaces.

```bash
switch(config)#service interface unconnected expose
switch(config)#interface UnconnectedEthernet 2
switch(config-if-Ue2)#traffic-loopback source system device mac
switch(config-if-Ue2)#channel-group recirculation 627
```

The following example enables display of the inactive interfaces using the `show` command.
Example

```
switch(config)#service interface inactive expose
```

Running a show command generates the following output:

```
switch(config)#sho int et21/1-4 stat
```

<table>
<thead>
<tr>
<th>Port Encapsulation</th>
<th>Name</th>
<th>Status</th>
<th>Vlan</th>
<th>Duplex</th>
<th>Speed</th>
<th>Type</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et21/1</td>
<td>connected</td>
<td>1</td>
<td>full</td>
<td>100G</td>
<td>100GBASE-CR4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Et21/2</td>
<td>inactive</td>
<td>1</td>
<td>full</td>
<td>25G</td>
<td>100GBASE-CR4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Et21/3</td>
<td>inactive</td>
<td>1</td>
<td>full</td>
<td>25G</td>
<td>100GBASE-CR4</td>
<td></td>

16.2.6  VXLAN Bridging and Routing Support

Describes the support of VXLAN Bridging and Routing on the R3 series of DCS 7280, 7500, and 7800 Arista switches.

16.2.6.1  Platform Compatibility

VXLAN Bridging and Routing support is available on the following R3 Series platforms:

- DCS-7280R3
- DCS-7500R3 Linecards
- DCS-7800R3 Linecards

16.2.6.2  Differences with DCS-7500R2 Implementation

The following are notable differences with respect to implementation of VXLAN on the R3 Series of switches.

- There is no need to configure the VXLAN-routing TCAM profile to enable VXLAN routing on the R3 Series switches. The command is still accepted for backward compatibility reasons.
- CPU bound traffic after VXLAN decapsulation (such as routing protocol packets) use the same CoPP queues used by the non VXLAN decapsulated packets. This is an improvement over the R2 series behavior where the CPU bound traffic after VXLAN decapsulation took a different CoPP queue that was shared with other IP Unicast packets.

16.2.6.3  Limitations

There is no EVPN VxLAN Multicast (Type 6/7/8 NLRI) support.

16.2.7  Data Structures

VXLAN implementation requires two VXLAN tables and a MAC address table accommodation.
16.2.7.1  MAC Address Table VXLAN Support
MAC address table entries correlate MAC addresses with the port upon which packets arrive. In addition to Ethernet and port channels, the port column may specify a VTI for packets that arrive on a VLAN from a remote port through the VXLAN segment.

16.2.7.2  VTEP-MAC Address Table
VTEP-MAC address table entries correlate MAC address with the IP address of the VTEP from where packets bearing the MAC address arrive. The VTI uses this table to determine the destination address for packets that are sent to remote hosts.

16.2.7.3  VNI-VLAN Map
The VNI-VLAN map displays the one-to-one correspondence between the VNIs assigned on the switch and the VLANs to which they are assigned. Each VNI can be assigned to only one VLAN; each VLAN can be assigned a maximum of one VNI. Each VNI-VLAN assignment constitutes a VXLAN segment.

16.3  VXLAN Configuration
These sections describe VXLAN configuration tasks:
- Configuring the VTI
- Head End Replication Configuration
- VXLAN Routing Configuration
- Configuring VXLAN Routing with Overlay VRFs
- Configuring VXLAN over MLAG
- Configuring VXLAN Control Service
- Configuring VXLAN Multicast Decapsulation
- VXLAN Rules Support for Mirror ACLs Configuration
- Configuring EVPN VXLAN
- Displaying VXLAN Configuration
- Displaying VXLAN Bridging and Routing Support

16.3.1  Configuring the VTI
Configuring the VTI enables VXLAN bridging and is a requirement for VXLAN Routing. The following sections describe the steps required to enabling VXLAN bridging by bringing up the VXLAN line protocol. VXLAN Routing Configuration describes the additional steps required to enable VXLAN routing.

Instantiating the VTI and VXLAN Configuration Mode
The `interface vxlan` command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN tunnel interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

Example
These commands create VXLAN tunnel interface 1, place the switch in VXLAN-interface configuration mode, and display parameters of the new VTI.

```
switch(config)#interface vxlan 1
```
Assigning an IP address to the VTEP

The `vxlan source-interface` command specifies the loopback interface from which the VTEP derives the source address (IP) that it uses when exchanging VXLAN frames. This address is used by UDP headers to specify source and destination addresses of hosts that send or receive VXLAN encapsulated packets.

There is no default source interface assignment. A valid VXLAN configuration requires the assignment of a loopback interface to the VTEP and the assignment of a valid IP address to the specified interface.

**Example**

These commands configure VTI 1 to use IP address 10.25.25.3 (loopback interface 15) as the source interface in the encapsulation fields of outbound VXLAN frames.

```bash
switch(config)#interface loopback 15
switch(config-if-Lo15)#ip address 10.25.25.3/24
switch(config-if-Lo15)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 15
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan source-interface Loopback15
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

Assigning a UDP Port to the VTEP

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header, then sent through a pre-configured UDP port. Packets that arrive through this port are assumed to be VXLAN encapsulated and sent to the bridging domain of the recipient VLAN as determined by the VNI in the VXLAN header and the VNI-VLAN map.

The `vxlan udp-port` command associates a UDP port with the configuration mode VXLAN interface (VTI). By default, UDP port 4789 is associated with the VTI.

**Note:** UDP port 4789 is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

**Examples**

- This command associates UDP port 5500 with VXLAN interface 1.

  ```bash
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan udp-port 5500
  switch(config-if-Vx1)#show active
  interface Vxlan1
    vxlan udp-port 5500
  switch(config-if-Vx1)#
  ```

- This command resets the VXLAN interface 1 UDP port association of 4789.

  ```bash
  switch(config-if-Vx1)#no vxlan udp-port
  switch(config-if-Vx1)#show active
  interface Vxlan1
    vxlan udp-port 4789
  ```
Assigning a VNI to a VLAN

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI associated with the VLAN. Packets that arrive on the VTI's UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace existing VLAN assignment statements in running-config. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The `vxlan vlan vni` command associates a VLAN ID with a virtual network identifier (VNI).

**Example**

These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
```

Verifying the VXLAN Configuration

The `show interface vxlan 1` displays the configuration and connection status of the VXLAN.

**Example**

This command indicates that the VXLAN line protocol status is **up**.

```
switch(config-if-Vx1)#show interface vxlan 1
Vxlan1 is up, line protocol is up (connected)
   Hardware is Vxlan
   Source interface is Loopback15 and is active with 10.25.25.3
   Static vlan to vni mapping is
   [100, 0.0.100]    [200, 10.10.200]
```

16.3.2 Head End Replication Configuration

Head-end replication is a data distribution method that supports broadcast, unknown unicast traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs specified by a flood list. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MAC addresses.

Each `vxlan flood vtep` statement in running-config associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured.
The VTEP flood list is created and modified through the `vxlan flood vtep` command.

**Examples**

- These commands create a default VXLAN head-end replication flood list.
  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1 10.1.1.2
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```

- These commands create VXLAN head-end replication flood lists for the VNIs accessed through VLANs 101 and 102.
  ```
  switch(config-if-Vx1)#vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  switch(config-if-Vx1)#show active
  interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```

### 16.3.3 VXLAN Routing Configuration

- Implementing VXLAN Routing
- Configuring Direct VXLAN Routing
- Configuring VXLAN VTEP counters
- VXLAN Auto Flood-List Construction

#### 16.3.3.1 Implementing VXLAN Routing

VXLAN routing is enabled by creating a VLAN interface (SVI) on a VLAN that is associated to a VNI. In the figure below, VXLAN routing is enabled on Switch A by configuring a VLAN interface with an IP address of 10.10.10.1. Packets from Devices A-1 and B-2 that have destinations other than 10.10.10.0/28 are VXLAN-bridged to the default gateway (10.10.10.1), then routed from Switch A.

![Figure 67: Implementing VXLAN Routing](image)

**Example**
These commands configure Switch A to perform VXLAN routing. The example includes OSPF routing that is used for underlay routing.

```console
switch-A(config)#route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan)#match interface loopb5
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan)#match interface vlan 100
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#router ospf 1
switch-A(config-router-ospf)#redistribute connected route-map vxlanvlan
switch-A(config-router-ospf)#exit
switch-A(config)#interface loopback 5
switch-A(config-if-Lo5)#ip address 10.25.25.3/24
switch-A(config-if-Lo5)#exit
switch-A(config)#interface vxlan 1
switch-A(config-if-Vx1)#vxlan source-interface loopback 5
switch-A(config-if-Vx1)#vxlan vlan 100 vni 10000
switch-A(config)#interface vlan 100
switch-A(config-if-Vl100)#ip address 10.10.10.1/28
switch-A(config-if-Vl100)#exit
```

### 16.3.3.2 Configuring Direct VXLAN Routing

Figure Implementing VXLAN Routing, VXLAN routing is enabled on Switch A only; Switch B supports VXLAN bridging. Traffic from Switch B devices to the external routes must go through the core route twice: once as they are bridged to is VXLAN gateway and once when routed to its next hop device.

Direct VXLAN routing with VXLAN enabled addresses this issue by configuring each VTEP with all VLANS. This allows packets to be VXLAN-bridged to a local VTEP and routed to remote VTEPs. Indirect routing scales well but is complex to engineer efficiently, and naked routing provides the same scalability to indirect routing. Direct routing leads to the most efficient traffic flows, with the number of virtual subnets or virtual machines increasing at scale, and is thereby optimal from a data plane viewpoint.

The following sections describe conventions required to implement Direct VXLAN Routing, then presents a direct VXLAN routing implementation.

#### Configuring VARP addresses

For direct routing, an anycast IP address is used as the gateway address on the SVI for a VLAN on all hardware VTEPs associated with that VLAN.

**Examples**

- These commands configure an IP virtual-router and virtual MAC address.

  ```console
  switch(config)#interface Vlan2417
  switch(config-if-Vl2417)#ip address 1.0.4.50/24
  switch(config-if-Vl2417)#ip virtual-router address 1.0.4.1 2:22
  switch(config)#
  
  switch(config)#interface Vlan2417
  switch(config-if-Vl2417)#ip address virtual 1.0.4.1/24
  ```
Virtual IP and MAC Addresses

Virtual-router IP addresses can be configured on VLAN interfaces in addition to a primary address. All VTEPs in a direct VXLAN network can be configured with the same virtual router address. This allows devices to use a common IP address as their VXLAN gateway.

The `ip address virtual` command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. This results in the virtual MAC address assignment to the VLAN interface. In large VXLAN networks, using distinct primary IP addresses for each VTEP limits the number addresses on its subnet for connected hosts. Defining a common virtual IP address for all VTEPs and using that as their primary addresses conserves subnet addresses.

**Example**

These commands specify a virtual router address of 00:00:00:00:00:48 for the switch and, for VLAN 100, a primary address of 10.10.10.10/28 and a virtual IP address of 10.10.10.10.

```
switch(config)#ip virtual-router mac-address 00:00:00:00:00:48
switch(config)#interface vlan 100
switch(config-if-Vl100)#ip address virtual 10.10.10.10/28
switch(config-if-Vl100)#show active
    interface Vlan100
        ip address virtual 10.10.10.10/28
switch(config-if-Vl100)#
```

Virtual VTEP Configuration

A virtual VTEP address is specified by configuring a secondary address on the loopback interface designated as the VXLAN’s source interface. All VTEPs in the direct routing topology share the same virtual VTEP address.

You must also configure the secondary VTEP IP on the flood-list of the downstream VXLAN VTEPS as shown below.

**Example**

These commands specify a primary (10.1.1.1) and virtual VTEP address (10.2.2.2).

```
switch1
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.1.1.1/24
switch(config-if-Lo5)#ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)#show active
    interface Loopback5
        ip address 10.1.1.1/24
        ip address 10.2.2.2/24 secondary
switch(config-if-Lo5)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 5
switch(config-if-Vx1)#show active
    interface Vxlan1
        vxlan source-interface Loopback5
        vxlan udp-port 4789
```
**Virtual Extensible LANs (VXLANs)**

```
vxlan vlan 100 vni 10000
switch(config-if-Vx1)#

switch2
switch(config)#interface vxlan1
switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1
switch(config-if-Vx1)#vxlan flood vtep 10.2.2.2
```

### Direct VXLAN Topology

The following figure displays a direct VXLAN topology, where each VTEP is configured with the same set of VNIs, VLAN interfaces, and virtual VTEP address.

![Direct VXLAN Topology Diagram](image)

**Figure 68: Direct VXLAN Routing**

### Example

These commands configure VXLAN parameters for Switch-A.

```
switch-A(config)#route-map vxlanvlan permit 10
switch-A(config-route-map-vxlanvlan)#match interface loopb5
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#route-map vxlanvlan permit 20
switch-A(config-route-map-vxlanvlan)#match interface vlan 100
switch-A(config-route-map-vxlanvlan)#exit
switch-A(config)#router ospf 1
switch-A(config-router-ospf)#redistribute connected route-map vxlanvlan
switch-A(config-router-ospf)#exit
switch-A(config)#ip virtual-router mac-address 00:00:00:00:00:48
switch-A(config)#interface loopback 5
switch-A(config-if-Lo5)#ip address 10.1.1.3/24
switch-A(config-if-Lo5)#ip address 10.1.1.10/24 secondary
switch-A(config-if-Lo5)#exit
switch-A(config)#interface vxlan 1
switch-A(config-if-Vx1)#vxlan source-interface loopback 5
switch-A(config-if-Vx1)#vxlan vlan 100 vni 10000
switch-A(config)#interface vlan 100
switch-A(config-if-Vl100)#ip address virtual 10.10.10.28
switch-A(config-if-Vl100)#exit
```
16.3.3.3 Configuring VXLAN VTEP Counters

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

The VXLAN VTEP counters feature enables a device to count VXLAN packets received and sent by the device on a per VTEP basis. Specifically, it enables the device to count bytes and packets that are getting encapsulated and decapsulated as they are passing through.

The counters are logically split up in the two VXLAN directions. Encapsulated on the device and directed to the core, “encap” counters count packets coming from the edge. Decapsulated on the device and heading towards the edge, “decap” counters count packets coming from the core.

To be able to count VXLAN packets the device has to support VXLAN and have a VXLAN interface correctly configured.

Examples

- This command configures the enabling of VXLAN VTEP counters for encap.

```
switch(config)#hardware counter feature vtep encap
```

- This command configures the disabling of VXLAN VTEP counters for encap.

```
switch(config)#no hardware counter feature vtep encap
```

- This commands configures the enabling of VXLAN VTEP counters for decap.

```
switch(config)#hardware counter feature vtep decap
```

- This commands configures the disabling of VXLAN VTEP counters for decap.

```
switch(config)#no hardware counter feature vtep decap
```

16.3.3.4 VXLAN Auto Flood-List Construction

With the introduction of wireless access points (APs), VXLAN flood-lists learned from the data-plane is added to or removed from the flood-lists created in the control-plane. When a VXLAN packet is received on a new VNI from a VTEP, it is added to the dynamic flood-list for that VNI and the flood-list is merged with flood-lists from other sources. When all MACs behind a remote VTEP have been removed through aging, for example, the remote VTEP is removed from all dynamic VXLAN flood-lists.

To restrict VTEPs from being added to dynamic flood-lists, when VXLAN traffic is received from untrusted sources, use the `vxlan learn-restrict` command. MAC learning is disabled from the specified IP ranges. The learning restrictions is placed on all platforms including APs.

**VXLAN Configuration for Learning Data-plane Flood-lists**

The following example is applicable to all platforms.

These commands enable VXLAN flood-lists learning from data-plane.

```
switch(config)#interface Vxlan1
switch(config-if-Vx1)#vxlan flood vtep learned data-plane
```
The following example restricts learning from VTEPs not in a prefix range.

```
switch(config-if-Vx1)#vxlan learn-restrict vtep <prefixes>
```

The following example restricts learning to VTEPs with IP in range.

```
switch(config-if-Vx1)#vxlan learn-restrict vtep 1.1.1.1/24
```

The following command shows the VXLAN flood-lists programmed in hardware.

```
switch(config)#show vxlan flood vtep
```

The following command shows the dynamic VXLAN flood-lists.

```
switch(config)#show l2Rib input vxlan-dynamic
```

The following command shows the VXLAN flood-lists sent to platform.

```
switch(config)#show l2Rib output floodset
```

The following command shows the VXLAN learning restrictions for all VLANs.

```
switch(config)#show vxlan learn-restrict vtep
```

The following command shows the VXLAN learning counters for all VLANs.

```
switch(config)#show vxlan counters learn-restrict all
```

### 16.3.4 Configuring VXLAN Routing with Overlay VRFs

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

VXLAN SVIs configured in non-default VRFs are supported with VXLAN routing using overlay VRFs. Overlay SVIs are configured in non-default VRFs but underlay SVIs, which provide IP connectivity between VTEPs, must remain in the default VRF. VXLAN routing is deployable by allowing users to configure separate overlay routing domains using VRFs per tenant, thereby allowing support for overlapping IP addresses in the overlay. This provides separation between overlay and underlay traffic, including simpler and cleaner protocol configuration, without using complicated route-maps to control distribution of prefixes to peers in the overlay VRFs and underlay SVIs. IPv4 based VXLAN routing is currently supported.

### 16.3.5 Configuring VXLAN over MLAG

VTI configuration must be identical on each MLAG peer for them to act as a single VTEP.

The following VTI elements must be configured identically on both MLAG peers:

**VLAN-VNI Mappings**

Configure identical VLAN to VNI mappings on both MLAG peers using the `vxlan vlan vni` command.

**Example**
These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#
```

**VTEP IP Address of the Source Loopback Interface**

Configure the same VTEP IP address for the source loopback interface on both MLAG peers using the `vxlan source-interface` command.

**Example**

These commands configure a primary VTEP address.

```
switch(config)#interface loopback 5
switch(config-if-Lo5)#ip address 10.1.1.1/24
switch(config-if-Lo5)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 5
switch(config-if-Vx1)#
```

**Flood VTEP List**

Configure the same VTEP flood list on both MLAG peers using the `vxlan flood vtep` command.

**Example**

These commands create a default VXLAN head-end replication flood list.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan flood vtep 10.1.1.1 10.1.1.2
switch(config-if-Vx1)#
```

**OSPF Configuration**

If OSPF is in use, configure the OSPF router ID using the `router-id` (OSPFv2) command to prevent the switch from using the common VTEP IP address as the router ID.

**Example**

These commands assign 10.0.0.1 as the OSPFv2 router ID.

```
switch(config)#router ospf 100
switch(config-router-ospf)#router-id 10.0.0.1
switch(config-router-ospf)#
```

16.3.6  **Configuring VXLAN Control Service**

The VXLAN Control Service (VCS) provides a mechanism by which hardware VTEPs share states between each other in order to establish VXLAN tunnels, without the need for a multicast control plane. This feature enables the use of a VCS client.

**Examples**
• These commands connect a switch to the VCS running on CVX. The server host IP address is the management IP address of the CVX controller or the IP address that CVX is listening on for client connections.

```
switch(config)#management cvx
switch(config-mgmt-cvx)#server host 172.27.6.248
switch(config-mgmt-cvx)#no shutdown
switch(config-mgmt-cvx)#
```

• These commands configure the VXLAN interface, except for the multicast group configuration, in order to learn from the controller.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan controller-client
switch(config-if-Vx1)#
```

### 16.3.7 Configuring VXLAN Multicast Decapsulation

The switch platforms which use this feature are:

- DCS-7050X
- DCS-7250X
- DCS-7300X

VXLAN multicast decapsulation enables VTEPs that support Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

**Examples**

• These commands enable VXLAN multicast decapsulation.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan multicast-group decap 230.1.1.1
switch(config-if-Vx1)#
```

• These commands disable VXLAN multicast decapsulation.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#no vxlan multicast-group decap 230.1.1.1
switch(config-if-Vx1)#
```

### 16.3.8 VXLAN Rules Support for Mirror ACLs Configuration

The switch platforms which use this feature are:

- DCS-7150S

VXLAN rules support for mirror ACLs configuration permit VXLAN deep inspection rules to be specified in the mirroring ACLs when the switch is operating in normal mode.

**Examples**

The following are examples of VXLAN rules specified in mirroring ACLs.

• These commands permit all VXLAN traffic (udp protocol and destination port 4789).

```
switch(config)#ip access-list miracl
switch(config-acl-miracl)#permit vxlan any any
switch(config-acl-miracl)#
```
• These commands permit VXLAN traffic with vni 1001 only.

```
switch(config)#ip access-list miracl
switch(config-acl-miracl)#permit vxlan any any vni 1001 0x000000
```

• These commands deny VXLAN traffic with vni 0x1000 through 0x100f.

```
switch(config)#ip access-list miracl
switch(config-acl-miracl)#permit vxlan any any vni 0x1000 0x100f
```

### 16.3.9 Configuring EVPN VXLAN

#### Supported Configurations

**EOS Release 4.23.1**

1. Static EVPN VXLAN Config.
2. VXLAN Bridging Config.
3. Introduces the `ip virtual-router router-mac` command.

**EOS Release 4.23.2**

1. IPv6 overlay.
2. VARP and Virtual VTEP with VxLAN routing.
3. EVPN VXLAN (Single Active - No Multihoming support).
4. VXLAN with MLAG.

**EOS Release 4.24.1**

Overlay Multicast using VXLAN underlay multicast tree.

**EOS Release 4.24.2F**

EVPN VXLAN All Active Multihoming.

### 16.3.9.1 Static EVPN VxLAN Configuration

```
switch(config)#service routing protocols model multi-agent
switch(config)#interface Loopback0
switch(config-if-Lo0)#ip address 172.16.1.1/32

switch(config)#interface Vxlan1
switch(config-if-Vx1)#vxlan source-interface Loopback0
switch(config-if-Vx1)#vxlan udp-port 4789
switch(config-if-Vx1)#vxlan vrf test vni 12345

switch(config)#ip routing vrf test
switch(config)#ipv6 unicast-routing vrf test

switch(config)#ip route vrf test 192.168.1.0/24 vtep 10.1.1.2 vni 20000 router-mac-address 00:00:78:01:00:00
switch(config)#ipv6 route vrf test 1:0:5::0/64 vtep 10.1.1.2 vni 30000 router-mac-address 00:00:80:01:00:00
```
16.3.9.2 VxLAN Bridging and Routing Configuration

```plaintext
switch(config)#interface Loopback0
switch(config-if-Lo0)#ip address 172.16.1.1/32
!
switch(config)#ip virtual-router mac-address 00:02:03:04:05:06
!
switch(config)#ip routing
!
switch(config)#interface Vxlan1
switch(config-if-Vx1)#vxlan source-interface Loopback0
switch(config-if-Vx1)#vxlan udp-port 65330
switch(config-if-Vx1)#vxlan vlan 300 vni 945438
switch(config-if-Vx1)#vxlan vlan 200 vni 654677
switch(config-if-Vx1)#vxlan flood vtep 172.16.1.2 172.16.1.3 172.16.1.1
```

16.3.9.3 EVPN VxLAN All Active Multihoming

Multi-homing is activated in an EVPN environment by assigning an ethernet segment identifier to the participating Ethernet or Port-Channel interfaces.

```plaintext
switch(config)#interface Ethernet1
switch(config-if-Et1)#evpn ethernet-segment
switch(config-evpn-es)#identifier 00aa:bbbb:cccc:dddd:eedd
switch(config-evpn-es)#route-target import 12:34:56:78
```

The optional designated-forwarder election hold-time command can configure a wait time before selecting the designated forwarder and allow potential forwarders a chance to advertise their EVPN ethernet segment (type 4) routes. The default hold time is three (3) seconds, as specified in section 8.5 of RFC7432[1].

The route target configured here is the ES import route target described in section 7.6 of RFC7432[1]. It can be set to any MAC address, but for each Ethernet segment every participating interface in the network must use the same ES import route target. A suggested value is the MAC address of the CE connected to the multi-homing PEs via this interface.

16.3.9.4 VARP and Virtual VTEP with VXLAN Routing

```plaintext
interface Loopback0
  ip address 172.16.1.1/32
  ip address 20.0.0.1/32 secondary
!
ip virtual-router mac-address 00:02:03:04:05:06
!
ip routing
!
interface Vlan200
  ipv6 address 2000:0:0:41::2/64
  ip address virtual 1.0.7.1/24
  ipv6 virtual-router address 2000:0:0:41::1
!
interface Vxlan1
  vxlan source-interface Loopback0
  vxlan udp-port 65330
  vxlan vlan 300 vni 945438
  vxlan vlan 200 vni 654677
  vxlan flood vtep 172.16.1.2 172.16.1.3 172.16.1.1 20.0.0.1
```
16.3.9.5 Overlay Multicast using VxLAN Underlay Multicast Tree

To inject a source route, configure the `ip multicast source route export` command on the incoming interface.

```
switch(config)#interface Vlan10
switch(config-Vl10)#ip pim sparse-mode
switch(config-Vl10)#ip multicast source route export
```

To redistribute the source routes in the MRIB via BGP while running multi-agent protocol model, configure the `redistribute attached-host` command for the IPv4 multicast address-family. Activate the neighbor to establish a BGP connection.

```
switch(config-router-bgp)#address-family ipv4 multicast
switch(config-router-bgp-af)#neighbor 3.0.0.2 activate
switch(config-router-bgp-af)#redistribute attached-host
```

To redistribute the source routes in the URIB via BGP while running ribd protocol model, configure the `redistribute attached-host` command under the `router bgp` mode.

```
switch(config-router-bgp)#redistribute attached-host
```

This following is a sample configuration for a VTEP for the setup above using multi-agent protocol model.

```
switch(config)#service routing protocol model multi-agent
switch(config)#ip pim rp-address 15.15.15.15 225.1.1.1/32
switch(config)#interface Loopback0
switch(config-if-Lo0)#ip address 1.1.1.1/32
switch(config)#interface vxlan1
switch(config-if-Vx1)#vxlan source-interface Loopback0
switch(config-if-Vx1)#vxlan vlan10 vni 10000

! Interface to the underlay
switch(config)#interface Ethernet1
switch(config-if-Et1)#ip address 3.0.0.1/24
switch(config-if-Et1)#ip pim sparse-mode

switch(config)#interface vlan10
switch(config-if-Vl10)#ip address 10.1.1.1/24
switch(config-if-Vl10)#ip pim sparse-mode
switch(config-if-Vl10)#ip multicast source route export

switch(config)#router bgp 10
switch(config-router-bgp)#router-id 0.0.0.2

switch(config-router-bgp)#address-family ipv4 multicast
switch(config-router-bgp-af)#neighbor 3.0.0.2 activate
switch(config-router-bgp-af)#redistribute attached-host
```

This following is a sample configuration for a VTEP for the setup above using the ribd protocol model.

```
switch(config)#service routing protocol model ribd
switch(config)#ip pim rp-address 15.15.15.15 225.1.1.1/32
switch(config)#interface Loopback0
```
Virtual Extensible LANs (VXLANs)

switch(config-if-Lo0)#ip address 1.1.1.1/32
switch(config)#interface vxlan1
switch(config-if-Vxl1)#vxlan source-interface Loopback0
switch(config-if-Vxl1)#vxlan vlan10 vni 10000

! Interface to the underlay
switch(config)#interface Ethernet1
switch(config-if-Et1)#ip address 3.0.0.1/24
switch(config-if-Et1)#ip pim sparse-mode

switch(config)#interface vlan10
switch(config-if-Vl1)#ip address 10.1.1.1/24
switch(config-if-Vl1)#ip pim sparse-mode
switch(config-if-Vl1)#ip multicast source route export

switch(config)#router bgp 10
switch(config-router-bgp)#router-id 0.0.0.2
switch(config-router-bgp)#redistribute attached-host

16.3.10 Displaying VXLAN Configuration

The following section describes the commands that control the display format of VNIs and the commands that list VXLAN configuration and transmission information.

Configuring VNI Display Format

The `vxlan vni notation dotted` command configures the switch to display VNIs in dotted decimal notation. VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

The command affects the VNI number display in all `show` commands, including `show running-config`. Commands that include VNI as a parameter may use decimal or dotted decimal notation regardless of the setting of this command. By default, `show` commands display VNI number in decimal notation.

Examples

- These commands configure the switch to display vni numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

  switch(config)#vxlan vni notation dotted
  switch(config)#interface vxlan 1
  switch(config-if-Vxl1)#show active
  interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 333 vni 3.4.5
  switch(config-if-Vxl1)#

- These commands configure the switch to display vni numbers in decimal notation, then displays a configuration that includes a VNI setting.

  switch(config)#no vxlan vni notation dotted
  switch(config)#interface vxlan 1
  switch(config-if-Vxl1)#show active
  interface Vxlan1
  vxlan udp-port 4789
  vxlan vlan 333 vni 197637
  switch(config-if-Vxl1)#
MAC Address Table
The MAC address table indicates a MAC address from a device on a remote host by indicating Vx interface as the port that corresponds to the address.

Example
The `show mac address-table` command displays a MAC address table that includes entries of devices from remote hosts by specifying Vx1 as the corresponding port.

```
switch> show mac address-table
Mac Address Table
------------------------------------------------------------------
<table>
<thead>
<tr>
<th>Vlan</th>
<th>Mac Address</th>
<th>Type</th>
<th>Ports</th>
<th>Moves</th>
<th>Last Move</th>
</tr>
</thead>

switch>
```

VXLAN MAC Address Table
VXLAN MAC address table entries correlate MAC addresses accessible through remote VTEPs with the local VLAN and the IP address of the VTEP through which the addressed device is accessed. The VTI uses this table when constructing the VXLAN encapsulation to specify the destination IP address of the recipient VTEP and the VNI segment through which the device's remote VLAN is accessed.

The `show vxlan address-table` command displays the VXLAN MAC address table.

Example
This command displays the VXLAN address table.

```
switch> show vxlan address-table
Vxlan Mac Address Table
------------------------------------------------------------------
<table>
<thead>
<tr>
<th>Vlan</th>
<th>Mac Address</th>
<th>Type</th>
<th>Prt</th>
<th>Vtep</th>
<th>Moves</th>
<th>Last Move</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

switch>
```

VXLAN MAC Address Table
The `show vxlan vtep` command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

Example

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch>show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps: 1
switch>
```

**VXLAN Counters**

The `clear vxlan counters` command resets the VXLAN counters. The `show vxlan counters` command displays the VXLAN counters.

**Example**

This command displays the VXLAN counters

```
switch>show vxlan counters software
encap_bytes:3452284
encap_pkts:27841
encap_read_err:1
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:1427
decap_bytes_total:382412426
decap_pkts_total:2259858
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:45128
decap_bytes_filter:5908326
decap_discard_vxhdr:0
decap_discard_vlan_map:2214730
decap_timeout:0
decap_sock_err:1
switch>
```

### 16.3.11 Displaying VXLAN Bridging and Routing Support

All show commands applicable to prior VXLAN implementations on R2 series are also available on R3 series for VXLAN debugging.

The `show interfaces vxlan` command displays operational status and configuration information of the specified VXLAN.

```
switch(config)#show interfaces vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
  Use 'show vxlan vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
    100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
```
The *show arp* command displays all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface vxlan 1
Address         Age (sec) Hardware Addr   Interface
192.168.10.1              -  0000.abab.abab  Vlan100, Vxlan1
```

The *show arp interface summary* command displays a summary of all ARP tables on the configured VXLAN.

```
switch(config)# show arp interface vxlan 1 summary
Total: 1
Static: 1
Dynamic: 0
Not learned: 0
```

The *show vxlan counters software* command displays the VXLAN software counters.

```
switch(config)# show vxlan counters software
Rx bytes for encapsulation : 0
Rx pkts for encapsulation   : 0
Rx high priority bytes for encapsulation : 0
Rx high priority pkts for encapsulation : 0
Rx low priority bytes for encapsulation : 0
Rx low priority pkts for encapsulation : 0
```

The *show vxlan vni* command displays information about the VXLAN mapping.

```
switch(config)# show vxlan vni
VNI to VLAN Mapping for Vxlan1
VNI       VLAN       Source       Interface         802.1Q Tag
--------- ---------- ------------ ----------------- ----------
100       100        static       Ethernet2/1       untagged
Vxlan1            100
```

Note: * indicates a Dynamic VLAN

The *show vxlan vtep* command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

```
switch(config)# show vxlan vtep
Remote VTEPS for Vxlan1:
10.1.1.1
Total number of remote VTEPS: 1
```

The *show platform fap vxlan vtep encapsulation* command displays the VTEP table.

```
switch(config)# show platform fap vxlan vtep encapsulation
Tunnel Type: R(Vxlan-Routing), B(Vxlan-Bridging)
D - ECMP is divergent across switching chips

<table>
<thead>
<tr>
<th>Destination</th>
<th>Ecmp</th>
<th>Fec</th>
<th>Tunnel</th>
<th>Tunnel</th>

16.4 VXLAN Command Descriptions

VXLAN Global Configuration Commands
- interface vxlan
- ip address virtual
- vxlan vni notation dotted

VXLAN Interface Configuration Commands
- vxlan flood vtep
- vxlan multicast-group decap
- vxlan source-interface
- vxlan udp-port
- vxlan vni vni

VXLAN Bridging and Routing Commands
- designated-forwarder election hold-time
- ip multicast source route export
- redistribute attached-host
- show arp
- show interfaces vxlan

VXLAN Display and Clear Commands
- clear vxlan counters
- show arp
- show interfaces vxlan
- show service vxlan
- show vxlan address-table
- show vxlan counters
- show vxlan flood vtep
- show vxlan vtep
16.4.1 clear vxlan counters

The `clear vxlan counters` command resets the VXLAN counters.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear vxlan counters ROUTE_TYPE
```

**Parameters**
- **ROUTE_TYPE** Specifies the type of VXLAN counter reset by the command.
  - `software` Command resets software counters.
  - `varp` Command resets virtual-ARP counters.

**Related Commands**
- `show vxlan counters` displays the VXLAN counters.

**Example**
This command resets the VXLAN counters

```
switch# clear vxlan counters software
switch# show vxlan counters software
encap_bytes:0
encap_pkts:0
encap_read_err:0
encap_discard_runt:0
encap_discard_vlan_range:0
encap_discard_vlan_map:0
encap_send_err:0
encap_timeout:0
decap_bytes_total:0
decap_pkts_total:0
decap_bytes:0
decap_pkts:0
decap_runt:0
decap_pkt_filter:0
decap_bytes_filter:0
decap_discard_vxhdr:0
decap_discard_vlan_map:0
decap_timeout:0
decap_sock_err:0
switch#
```
16.4.2 designated-forwarder election hold-time

The optional designated-forwarder election hold-time command can configure a wait time before selecting the designated forwarder and allow potential forwarders a chance to advertise their EVPN ethernet segment (type 4) routes. The no and default forms of the command removes the election hold time.

Command Mode
EVPN Ethernet segment identifier configuration mode

Command Syntax

designated-forwarder election hold-time sec

no designated-forwarder election hold-time sec

default designated-forwarder election hold-time sec

Parameters

sec Number of seconds for the timer waiting to receive updates from other PE. Range 0 - 1800.

Example

switch(config)#interface Ethernet1
switch(config-if-Et1)#evpn ethernet-segment
switch(config-evpn-es)#designated-forwarder election hold-time 20
16.4.3 interface vxlan

The `interface vxlan` command places the switch in VXLAN-interface configuration mode for modifying the specified VXLAN tunnel interface (VTI). The command also instantiates the interface if it was not previously created.

VXLAN interface configuration mode is not a group change mode; `running-config` is changed immediately after commands are executed. The `exit` command does not affect the configuration.

The `no interface vxlan` deletes the specified VTI interface, including its configuration statements, from `running-config`. The `default interface vxlan` command removes all configuration statements for the specified VTI from `running-config` without deleting the interfaces.

**Command Mode**

Global Configuration

**Command Syntax**

```
interface vxlan vx_range
no interface vxlan vx_range
default interface vxlan vx_range
```

**Parameter**

- **vx_range** VXLAN interface number. The only permitted value is 1.

**Commands Available in link-flap Configuration Mode**

- `vxlan source-interface`
- `vxlan udp-port`
- `vxlan vlan vni`

**Examples**

- These commands create VXLAN tunnel interface 1, place the switch in VXLAN-interface configuration mode, then display parameters of the new VTI.

  ```
  switch(config)# interface vxlan 1
  switch(config-if-Vx1)# show active
  interface Vxlan1
  vxlan udp-port 4789
  switch(config-if-Vx1)#
  ```

- This command exits VXLAN-interface configuration mode, placing the switch in global configuration mode.

  ```
  switch(config-if-Vx1)# exit
  switch(config)#
  ```
16.4.4 ip address virtual

The `ip address virtual` command configures a specified address as the primary IPv4 address and as a virtual IP address for the configuration mode VLAN interface. The address resolves to the virtual MAC address configured through the `ip virtual-router mac-address` command. The command includes a subnet designation that is required in primary IP address assignments.

This command is typically used in VXLAN routing configurations as an alternative to assigning a unique IP address to each VTEP. All existing IPv4 addresses must be removed from the interface before executing this command.

The `no ip address virtual` and `default ip address virtual` commands remove the IPv4 address and virtual IP assignment from the configuration mode interface by deleting the `ip address virtual` command from `running-config`.

Removing the IPv4 address assignments from an interface disables IPv4 processing on that port.

**Command Mode**

Interface-VLAN Configuration

**Command Syntax**

```
ip address virtual ipv4_subnet
no ip address virtual
default ip address virtual
```

**Parameters**

- `ipv4_subnet` IPv4 and subnet address (CIDR or address-mask notation).

**Related Commands**

- `ip address`
- `ip virtual-router mac-address`

**Example**

This command configures 10.10.10.1 as the IPv4 address and virtual address for VLAN 100.

```
switch(config-if-Vl100)#show active
interface Vlan100
  ip address virtual 10.10.1.28
switch(config-if-Vl100)#
```
16.4.5 ip multicast source route export

Use the `ip multicast source route export` command to inject a source route on the incoming interface.

**Command Mode**
Interface configuration mode

**Command Syntax**

```
ip multicast source route export num
no ip multicast source route export num
default ip multicast source route export num
```

**Parameters**

`num` Administrative distance for this route. Range 1-255.

**Example**

```
switch(config)#interface Vlan10
switch(config-Vl10)#ip pim sparse-mode
switch(config-Vl10)#ip multicast source route export
```
16.4.6  redistribute attached-host

Use the `redistribute attached-host` to redistribute the source routes in the MRIB via BGP while running multi-agent protocol model for the IPv4 multicast address-family. This activates the neighbor to establish a BGP connection.

**Command Mode**
BGP router address-family configuration mode

**Command Syntax**

```
redistribute attached-host route-map name
no redistribute attached-host route-map name
default redistribute attached-host route-map name
```

**Parameters**

- `route-map name` Name of the route map.

**Example**

```
switch(config-router-bgp)#address-family ipv4 multicast
switch(config-router-bgp-af)#neighbor 3.0.0.2 activate
switch(config-router-bgp-af)#redistribute attached-host
```
16.4.7  show arp

Use the **show arp** command to display and modify entries in the Address Resolution Protocol (ARP) cache.

**Command Mode**

EXEC

**Command Syntax**

```
```

**Parameters**

- **agent** ARP Agent information.
  - **ipv4** Details related to IPv4.
  - **ipv6** Details related to IPv6.
- **host name** Hostname filter name.
- **A.B.C.D** IP address filter.
  - **host** Hostname filter.
  - **interface** Interface selector.
  - **mac-address** MAC address filter.
  - **summary** Displays a summary of ARP entries.
- **interface** Interface selector.
  - **Ethernet** Ethernet interface.
  - **Fabric** Fabric interface.
  - **Loopback** Hardware interface used in looping packets.
  - **Management** Management interface.
  - **Port-Channel** Port-Channel sub interface.
  - **Switch** Switch interface.
  - **Tunnel** Tunnel interface.
  - **Vlan** Logical interface into a VLAN.
  - **Vxlan** VXLAN tunnel interface.
- **mac-address H.H.H** MAC address filter Ethernet address.
- **monitor** Monitored IP/IPv6 addresses.
  - **summary** Displays a summary of monitored IP/IPv6 addresses.
  - **vrf** Displays monitored IP/IPv6 addresses in a VRF.
- **remote vlan** Remote host bindings displaying information about the specified VLAN.
- **resolve** Resolves host names.
  - **host** Hostname filter.
  - **interface** Interface selector.
  - **mac-address** MAC address filter.
  - **A.B.C.D** IP address filter.
- **summary** Displays a summary of the ARP entries.
  - **total** Displays a count of the total ARP entries.
  - **vrf** Displays ARP entries in a VRF.
  - **word** The VRF name.
  - **all** All virtual routing and forwarding instances.
Examples

- The `show interfaces vxlan` command displays operational status and configuration information of the specified VXLAN.

  ```
  switch(config)#show interfaces vxlan 1
  Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
  Use 'show vxlan vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
  100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
  VTEP address mask is Non
  ```

- The `show arp` command displays all ARP tables on the configured VXLAN.

  ```
  switch(config)#show arp interface vxlan 1
  Address         Age (sec)  Hardware Addr   Interface
  192.168.10.1              -  0000.abab.abab  Vlan100, Vxlan1
  ```

- The `show arp interface summary` command displays a summary of all ARP tables on the configured VXLAN.

  ```
  switch(config)#show arp interface vxlan 1 summary
  Total: 1
  Static: 1
  Dynamic: 0
  Not learned: 0
  ```
16.4.8 show interfaces vxlan

Use the `show interfaces vxlan` command to display the operational status and configuration information of the specified VXLAN.

**Command Mode**

EXEC

**Command Syntax**

`show interfaces vxlan num`

**Parameters**

`num` VXLAN tunnel interface number. Range 1-1.

**Example**

```
switch(config)#show interfaces vxlan 1
Vxlan1 is up, line protocol is up (connected)
  Hardware is Vxlan
  Source interface is Loopback0 and is active with 172.16.1.1
  Replication/Flood Mode is headend with Flood List Source: CLI
  Remote MAC learning via Datapath
  VNI mapping to VLANs
  Static VLAN to VNI mapping is 
    [100, 100]
  Note: All Dynamic VLANs used by VCS are internal VLANs.
  Use 'show vxlan vni' for details.
  Static VRF to VNI mapping is not configured
  Headend replication flood vtep list is:
    100 172.16.1.2 10.1.1.1
  MLAG Shared Router MAC is 0000.0000.0000
  VTEP address mask is Non
```
16.4.9  show service vxlan

The `show service vxlan` command displays the status of the Vxlan Control Service (VCS) and the received (from all connected VTEPs) and advertised (to all connected VTEPs) MAC address reachability information.

**Command Mode**

EXEC

**Command Syntax**

```
show service vxlan [status | switch [SWITCH_TYPE] | vni [VNI_INFO]]
```

**Parameters**

- **SWITCH_TYPE** displayed by switch type. Options include:
  - *word* hostname, IP address, or ID of the switch.
  - *all* all switches.
- **VNI_INFO** displayed with VNI information. Options include:
  - *advertised* advertised MAC addresses.
  - *received* received MAC addresses.

**Example**

This command displays the status of the VCS.

```
switch(config)#show service vxlan status
Vxlan Controller Service is   : stopped
Mac learning                  : Control plane
Resync period                 : 300 seconds
Resync in progress            : No
Capability                    : VXLAN v4 overlay routing
                               VXLAN v4 overlay indirect routing

fm319(config-if-Vx1)#show service vxlan status
Vxlan Controller Service is   : stopped
Mac learning                  : Control plane
Resync period                 : 300 seconds
Resync in progress            : No
Capability                    : VXLAN v4 overlay routing
                               VXLAN v4 overlay indirect routing

switch(config)#
```
16.4.10 show vxlan address-table

The `show vxlan address-table` command displays the VXLAN address table. Entries are created by extracting information from packets received from remote VTEPs.

The VXLAN address table correlates MAC addresses that are accessible through remote VTEPs with the local VLAN and the IP address of the VTP through which the addressed device is accessible. The VTI uses this table when constructing the VXLAN encapsulation fields to specify the destination IP address of the recipient VTEP and the VNI segment through which the device’s remote VLAN is accessed.

**Command Mode**

EXEC

**Command Syntax**

`show vxlan address-table [ENTRY_TYPE][MAC_ADDR][VLANS][REMOTE_VTEP]`

**Parameters**

- **ENTRY_TYPE** command filters display by entry type. Options include:
  - `<no parameter>` all table entries.
  - `configured` static entries; includes unconfigured VLAN entries.
  - `dynamic` entries learned through packet receipts.
  - `static` entries entered by CLI commands.
  - `unicast` entries with unicast MAC address.
- **MAC_ADDR** command uses MAC address to filter displayed entries.
  - `<no parameter>` all MAC addresses table entries.
  - address `mac_address` displays entries with specified address (dotted hex notation – H.H.H).
- **VLANS** command filters display by VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_num` VLAN specified by `v_num`.
- **REMOTE_VTEP** Filters entries by IP address of the remote VTEPs. Options include:
  - `<no parameter>` all items.
  - `vtep ipaddr_1 [ipaddr_2...ipaddr_n]` Identifies VTEPs by their IP address.

**Example**

This command displays the VXLAN address table.

```
switch>show vxlan address-table
Vxlan Mac Address Table
-----------------------------------------------------------------------------------------
Vlan| Mac Address | Type | Prt | Vtep | Moves | Last Move
----|-------------|------|-----|------|-------|----------
 51 | 0000.0051.0101| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 51 | 0000.0051.0102| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 51 | 0000.0051.0103| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 51 | 0000.0051.0104| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 51 | 0000.0051.0105| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 61 | 0000.0061.0101| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 61 | 0000.0061.0102| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 61 | 0000.0061.0103| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 61 | 0000.0061.0104| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
 61 | 0000.0061.0105| DYNAMIC| Vx1 | 10.25.2.12| 1 | 4 days, 0:37:14 ago
switch>
```
16.4.11 show vxlan counters

The **show vxlan counters** command displays the VXLAN counters.

**Command Mode**

EXEC

**Command Syntax**

```
show vxlan counters ROUTE_TYPE
```

**Parameters**

- **ROUTE_TYPE** Specifies the type of VXLAN counter displayed by the command.
  - **software** Command displays software routers.
  - **varp** Command displays virtual-ARP counters.
  - **vtep** Command displays counters for VTEPs which are identified by their IP address. An optional keyword allows the user to view a single direction of the counters:
    - **encap** “encap” counters count packets coming from the edge, encapsulated on the device and directed to the core.
    - **decap** “decap” counters count packets coming from the core, decapsulated on the device and heading towards the edge.

**Related Command**

**clear vxlan counters** resets the VXLAN counters.

**Examples**

- **This command displays the VXLAN counters for software routers.**

  ```
  switch>show vxlan counters software
  encap_bytes:3452284
  encap_pkts:27841
  encap_read_err:1
  encap_discard_runt:0
  encap_discard_vlan_range:0
  encap_discard_vlan_map:0
  encap_send_err:0
  encap_timeout:1427
  decap_bytes_total:382412426
  decap_pkts_total:2259858
  decap_bytes:0
  decap_pkts:0
  decap_runt:0
  decap_pkt_filter:45128
  decap_bytes_filter:5908326
  decap_discard_vxhdr:0
  decap_discard_vlan_map:2214730
  decap_timeout:0
  decap_sock_err:1
  switch>
  ```

- **This command displays the VXLAN counters for VTEPs.**

  ```
  switch>show vxlan counters vtep

switch>
16.4.12  show vxlan flood vtep

The **show vxlan flood vtep** command displays the flood list that the switch is using to perform head-end replication. Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. The command displays the VLAN ID that references the configured VNIs (**vxlan vlan vni**).

The flood list is determined by the **vxlan flood vtep** command.

**Command Mode**
EXEC

**Command Syntax**

```
show vxlan flood vtep [VLANS]
```

**Parameters**

- **VLANS** command filters display by the reference VLAN.
  - `<no parameter>` all VLANs.
  - `vlan v_range` VLANs specified by `v_range`.

**Guidelines**

The command displays flood list contents only when the VLAN line protocol status is **up**.

**Related Commands**

- **vxlan flood vtep** configures the flood list.

**Example**

These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch> show vxlan flood vtep vlan 100-102

Vxlan Flood Vtep Table
-------------------------------
Vlan  Ip Address
-----  ---------------------
100    3.3.3.3
101    11.1.1.1  11.1.1.2  11.1.1.3
102    11.1.1.1  11.1.1.2  11.1.1.3
12.1.1.1

switch>
```
16.4.13  show vxlan vtep

The show vxlan vtep command displays information about remote VTEPs that the configured VTI has discovered and with whom it has exchanged packets.

Command Mode
EXEC

Command Syntax
show vxlan vtep

Example
These commands display the VTEPs that have exchanged data with the configured VTI.

```
switch>show vxlan vtep
Remote vteps for Vxlan1:
10.52.2.12
Total number of remote vteps: 1
switch>
```
16.4.14 vxlan flood vtep

The `vxlan flood vtep` command supports VXLAN head-end replication by creating or modifying a list that specifies remote VTEPs to which the switch bridges replicated traffic. Head-end replication is a data distribution method that supports broadcast, unknown unicast, and multicast (BUM) traffic over VXLANs by replicating BUM data locally for transmission to the set of remote VTEPs that a flood list specifies. This data flooding facilitates remote MAC address learning through the forwarding of data with unknown MACs.

Each `vxlan flood vtep` statement in `running-config` associates a set of VTEP addresses to an access VNI. A default flood list is also configurable that applies to all VNIs for which a flood list is not configured. The `vxlan flood vtep` command is available in the following formats to create or modify corresponding `running-config` statements:

- `vxlan flood vtep` creates a statement for a specified VNI and replaces existing statements for that VNI.
- `vxlan flood vtep add` modifies an existing flood statement by adding the specified VTEPs. This statement creates a list if it references a VNI that has no flood statement.
- `vxlan flood vtep remove` modifies an existing flood statement by deleting the specified VTEPs. This statement has no effect if it references a VNI that has no flood statement.

The `vxlan flood vtep` command specifies a VNI by referencing its associated VLAN ID (`vxlan vlan vni`). The command provides these options for specifying the reference VLANs:

- **a single VLAN**: creates or modifies a single statement referenced by the command.
- **a range of VLANS**: creates or modifies all statements referenced by the VLAN range.
- **no VLAN**: creates or modifies the default list

The `no vxlan flood vtep` and `default vxlan flood vtep` commands remove the specified flood list by deleting the corresponding `vxlan flood vtep` statements from `running-config`. Commands that specify a VLAN range remove all corresponding statements.

**Command Mode**

Interface-VXLAN Configuration

**Command Syntax**

```
vxlan [ACCESS_VNI] flood vtep [MODIFY] VTEP_1 [VTEP_2]...[VTEP_N]
no vxlan [ACCESS_VNI] flood vtep
default vxlan [ACCESS_VNI] flood vtep
```

**Parameters**

- **ACCESS_VNI** VLAN ID associated to the flood list's target VNI. Value ranges from 1 to 4094.
  - `<no parameter>` default list.
  - `vlan vlan_range` List of VLANS. (Number, range, comma-delimited list of numbers and ranges). Numbers range from 1 to 4094.
- **MODIFY** Statement modification method. Options include:
  - `<no parameter>` creates new list for specified VLANS. Current list is overwritten.
  - `add` specified VTEPs are added to existing list.
  - `remove` specified VTEPs are deleted from existing list.
  - `VTEP_X` IPv4 address of VTEPs that are added or removed from the list.

**Examples**

- These commands create a default VXLAN head-end replication flood list.

```
switch(config)# interface vxlan 1
switch(config-if-Vx1)# vxlan flood vtep 10.1.1.1 10.1.1.2
```
These commands create VXLAN head-end replication flood lists for the VNIs accessed through VLANs 101 and 102.

```
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

```
switch(config-if-Vx1)# vxlan vlan 101-102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan udp-port 4789
switch(config-if-Vx1)#
```

These commands add two VTEPs for the VNI access through VLAN 102.

```
switch(config-if-Vx1)# vxlan vlan 102 flood vtep add 12.1.1.1
switch(config-if-Vx1)# show active
interface Vxlan1
  vxlan flood vtep 10.1.1.1 10.1.1.2
  vxlan vlan 101 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3
  vxlan vlan 102 flood vtep 11.1.1.1 11.1.1.2 11.1.1.3 12.1.1.1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```
16.4.15 vxlan multicast-group decap

The `vxlan multicast-group decap` command enables VXLAN multicast decapsulation. VTEPs are enabled by VXLAN multicast decapsulation, supporting Head End Replication (HER). Multicast encapsulated Broadcast/Unknown/Multicast (BUM) packets terminate VTEPs from remote VTEPs that do not support HER.

The `no vxlan multicast-group decap` and `default vxlan multicast-group decap` commands disable VXLAN multicast decapsulation.

**Command Mode**
Interface-VXLAN Configuration

**Command Syntax**

```
vxlan multicast-group decap  group_addr
no vxlan multicast-group decap
default vxlan multicast-group decap
```

**Parameters**

- `group_addr` IPv4 address of multicast group. Dotted decimal notation of a valid multicast address.

**Examples**

- This command enables VXLAN multicast decapsulation.
  ```
  switch(config)# interface vxlan 1
  switch(config-if-Vx1)#vxlan multicast-group decap 230.1.1.1
  switch(config-if-Vx1)#
  ```

- This command disable VXLAN multicast decapsulation.
  ```
  switch(config)#interface vxlan 1
  switch(config-if-Vx1)#no vxlan multicast-group decap 230.1.1.1
  switch(config-if-Vx1)#
  ```
16.4.16  vxlan source-interface

The `vxlan source-interface` command specifies the interface from which the configuration mode VXLAN interface (VTI) derives the source address (IP) that it uses when exchanging VXLAN frames. There is no default source interface assignment.

The `no vxlan source-interface` and `default vxlan source-interface` commands remove the source interface assignment from the configuration mode VXLAN interface by deleting the corresponding `ip vxlan source-interface` command from `running-config`.

**Command Mode**

Interface-VXLAN Configuration

**Command Syntax**

```
vxlan source-interface INT_NAME
no vxlan source-interface
default vxlan source-interface
```

**Parameters**

- **INT_NAME**  Interface type and number. Options include:
  - `loopback l_num`  Loopback interface specified by `l_num`.

**Guidelines**

A VXLAN interface is inoperable without the source-interface assignment.

**Related Command**

`interface vxlan` places the switch in VXLAN interface configuration mode.

**Example**

These commands configure VTI 1 to use the IP address 10.25.25.3 as the source address of outbound VXLAN frames.

```
switch(config)#interface loopback 15
switch(config-if-Lo15)#ip address 10.25.25.3/24
switch(config-if-Lo15)#exit
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan source-interface loopback 15
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan source-interface Loopback15
  vxlan udp-port 4789
switch(config-if-Vx1)#
```
16.4.17  vxlan udp-port

The `vxlan udp-port` command associates a UDP port with the configuration mode VXLAN interface (VTI). By default, UDP port 4789 is associated with the VTI.

Packets bridged to the VTI from a VLAN are encapsulated with a VXLAN header that includes the VNI associated with the VLAN and the IP address of the VTEP that connects to the recipient, then sent through the UDP port. Packets that arrive through the UDP port are sent to the bridging domain of the recipient VLAN as determined by the VNI number in the VXLAN header and the interface’s VNI-VLAN map.

The `no vxlan udp-port` and `default vxlan udp-port` command restores the default UDP port association (4789) on the configuration mode interface by deleting the corresponding `vxlan udp-port` command from `running-config`.

Command Mode
Interface-VXLAN Configuration

Command Syntax

- `vxlan udp-port port_id`
- `no vxlan udp-port`
- `default vxlan udp-port`

Parameters
- `port_id`  UDP port number. Value ranges from 1024 to 65535.

Guidelines

UDP port 4789 is reserved by convention for VXLAN usage. Under most typical applications, this parameter should be set to the default value.

Related Commands
- `interface vxlan` places the switch in VXLAN interface configuration mode.

Examples

- This command associates UDP port 5500 with VXLAN interface 1.

```plaintext
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan udp-port 5500
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 5500
switch(config-if-Vx1)#
```

- This command resets the VXLAN interface 1 UDP port association of 4789.

```plaintext
switch(config-if-Vx1)#no vxlan udp-port
switch(config-if-Vx1)#show active
interface Vxlan1
  vxlan udp-port 4789
switch(config-if-Vx1)#
```
16.4.18 vxlan vlan vni

The `vxlan vlan vni` command associates a VLAN ID with a virtual network identifier (VNI). A VNI is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface (VTI). VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

When a VLAN bridges a packet to the VTI, the packet is encapsulated with a VXLAN header that includes the VNI that is associated with the VLAN. Packets that arrive on the VTI’s UDP socket are bridged to the VLAN that is associated with the VNI specified by the VXLAN header that encapsulates the packet.

The VTI requires a one-to-one correspondence between specified VLANs and VNI values. Commands that assign a new VNI to a previously configured VLAN replace the existing VLAN assignment statement in `running-config`. Commands that attempt to assign a VNI value to a second VLAN generate a CLI error.

The `no vxlan vlan vni` and `default vxlan vlan vni` commands remove the specified VLAN-VNI association from the configuration mode interface by deleting the corresponding `vxlan vlan` command from `running-config`.

Command Mode

Interface-VXLAN Configuration

Command Syntax

```
vxlan vlan vlan_id vni [vni_id]
no vxlan vlan vlan_id vni [vni_id]
default vxlan vlan vlan_id vni [vni_id]
```

Parameters

- `vlan_id` number of access VLAN. Value ranges from 1 to 4094.
- `vni_id` VNI number. Valid formats: decimal <1 to 16777215> or dotted decimal <0.0.1 to 255.255.255>.

Example

- These commands associate VLAN 100 to VNI 100 and VLAN 200 to VNI 10.10.200.

```
switch(config)#interface vxlan 1
switch(config-if-Vx1)#vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vlan 200 vni 10.10.200
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 200 vni 658120
    vxlan vlan 100 vni 100
switch(config-if-Vx1)#vxlan vni notation dotted
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 200 vni 10.10.200
    vxlan vlan 100 vni 0.0.100
switch(config-if-Vx1)#
```
16.4.19 vxlan vni notation dotted

The **vxlan vni notation dotted** command configures the switch to display VNIs in dotted decimal notation. A virtual network identifier (VNI) is a 24-bit number that is assigned to a VLAN to distinguish it from other VLANs that are on a VXLAN tunnel interface. VNI values range from 1 to 16777215 in decimal notation and from 0.0.1 to 255.255.255 in dotted decimal notation.

The command affects the VNI number display in all `show` commands, including `show running-config`. Commands that include VNI as a parameter may use decimal or dotted decimal notation regardless of the setting of this command. By default, show commands display VNI number in decimal notation.

The `no vxlan vni notation dotted` and `default vxlan vni notation dotted` commands restore the default setting of displaying VNI numbers in decimal notation by deleting the `vxlan vni notation dotted` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

`vxlan vni notation dotted`

`no vxlan vni notation dotted`

`default vxlan vni notation dotted`

**Examples**

- These commands configure the switch to display VNI numbers in dotted decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)#vxlan vni notation dotted
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 3.4.5
switch(config-if-Vx1)#
```

- These commands configure the switch to display VNI numbers in decimal notation, then displays a configuration that includes a VNI setting.

```
switch(config)#no vxlan vni notation dotted
switch(config)#interface vxlan 1
switch(config-if-Vx1)#show active
interface Vxlan1
    vxlan udp-port 4789
    vxlan vlan 333 vni 197637
switch(config-if-Vx1)#
```
Chapter 17

Ethernet VPN (EVPN)

This chapter describes Arista’s EVPN implementation. Sections in this chapter include:

- EVPN Overview
- EVPN Layer 3 Core Operations
- Integrated Routing and Bridging
- VPN MPLS Transport Options
- EVPN Type-5 Routes: IP Prefix Advertisement
- Inter-VRF Local Route Leaking
- Static Inter-VRF Route
- VCS to EVPN Hitless Migration
- Configuring EVPN
- Sharing Equivalence Class entry across multiple VRF
- Sample Configurations
- EVPN and VCS Commands

17.1 EVPN Overview

Ethernet VPN (EVPN) is a standards-based BGP control plane to advertise MAC addresses, MAC and IP bindings and IP Prefixes. This document focuses on EVPN and its operation with a VXLAN data plane for building overlay networks in the data center.

A number of control planes exist today for VXLAN, based on specific use cases, whether it be a requirement to integrate with an SDN overlay controller, or operate in a standards based flood and learn control plane model.

Current flood and learn models operate either with a multicast control plane, or ingress replication, where the operator manually configures the remote VTEPs in the flood list. Both of these are data-plane driven, that is, MAC’s are learned via flooding. In the IP multicast model MAC’s are learned in the underlay via flooding to an IP multicast group, while ingress replication (HER) floods to configured VTEP endpoints and no IP Multicast is required in the underlay.

The controller based solution with cloud vision exchange (CVX), locally learned MAC’s are published to a centralized controller and these MAC’s are then programed to all participating VTEPs.
A controller-less BGP EVPN MAC learning is a standards-based control-plane (MP-BGP) used to discover remote VTEPs and advertise MAC address and MAC/IP bindings in the VXLAN overlay, thus eliminating the flood and learn paradigms of the previously mentioned (multicast or HER) controller-less approaches. As a standards-based approach, the discovery and therefore the advertisement of the EVPN service models can inter-operate amongst multiple vendors.

This highlights an important and powerful advantage of BGP EVPN; that being, it is a single control plane for multiple data-plane encapsulations and defines both Layer 2 and Layer 3 VPN services. As network operators drive toward simplicity and automation, having one control plane protocol and address family for all data-planes and VPN services will prove extremely powerful.

The initial EVPN standard is RFC 7432 defined the BGP EVPN control plane and specifies an MPLS data-plane. The control plane with an MPLS data plane was extended to consider additional data plane encapsulations models including VXLAN, NVGRE and MPLS over GRE.

17.1.1 EVPN Terminology

The EVPN standard in the context of an NVO environment, defines the functionality for delivering multi-tenant Layer 2/3 VPN services using either VXLAN, NVGRE or MPLS over GRE encapsulation, across a common physical IP infrastructure. The standard introduces new terminology specific to a NVO environment, which are summarized below in relation to VXLAN encapsulation.

- Network Virtualization Overlay (NVO): The overlay network used to deliver the Layer 2 and Layer 3 VPN services. For VXLAN encapsulation, this would define a VXLAN domain, which would include one or more VNIs, for the transportation of tenant traffic over a common IP underlay infrastructure.
• **Network Virtualization End-Point (NVE):** The provider edge node within the NVO environment responsible for the encapsulation of tenant traffic into the overlay network. For a VXLAN data plane, this defines the Virtual Tunnel End-Point (VTEP).

• **Virtual Network Identifier (VNI):** The label identifier within the VXLAN encapsulated frame, defining a Layer 2 domain in the overlay network.

• **EVPN instance (EVI):** A logical switch within the EVPN domain which spans and interconnects multiple VTEPs to provide tenant Layer 2 and layer 3 connectivity.

• **MAC-VRF:** A Virtual Routing and Forwarding table for storing Media Access Control (MAC) addresses on a VTEP for a specific tenant.

---

**Figure 71: EVPN Terminology for a VXLAN Data Plane**

The new EVPN Network Layer Reachability Information (NLRI) is carried in BGP using Multi-protocol BGP Extensions with a newly defined Address Family Identifier (AFI) and Subsequent Address Family Identifier (SAFI).

To provide multi-tenancy, the standard uses the above traditional VPN methods to control the import and export of routes and provide support for overlapping IP address between tenants.

• **Multi-protocol BGP for EVPN:** A new AFI and SAFI have been defined for EVPN. These are AFI=25 (Layer 2 VPN) and SAFI = 70 (EVPN)

• **EVPN Layer 2/Layer 3 tenant segmentation:** Similar to standard MPLS VPN configurations Route Distinguisher's (RD's) and Route Targets (RT's) are defined for the VPN.

• **Route Target (RT):** To control the import and export of routes across VRFs, EVPN routes are advertised with Route-Target (RT) (BGP extended communities). The RT can be auto derived to simplify the rule configuration, typically this is based on the AS number and the VNI of the MAC-VRF.

• **Route Distinguisher (RD):** Unique number prepended to the advertised address within the VRF, ensuring support for overlapping IPs and MACs across different tenants.

The format of the MP_REACH_NLRI/MP_UNREACH_NLRI attribute, holding the new EVPN NLRI is illustrated below, where the next-hop address within the NLRI is the IP address of the VTEP advertising the EVPN route.
As illustrated, the original MPLS RFC (7348) and subsequent IP prefix draft (EVPN Terminology), introduce five unique EVPN route types.

Type-1 Route: Ethernet A-D route
Ethernet A-D route per ESI route, announces the reachability of a multi-homed Ethernet Segment. The route type is used for fast convergence (ie: ‘mass withdraw’) functions, as well as split horizon filtering used for active-active multi-homing.
Ethernet A-D route per EVI route, is used to implement the Aliasing and Backup Path features of EVPN associated with active-active multi-homing.

Type-2 Route: Host advertisement Route
Used to advertise the reachability of a MAC address, or optionally a MAC and IP binding as learned by a specific EVI. With the advertisement of the optional IP address of the host, EVPN provides the ability for VTEPs to perform ARP suppression and ARP proxy to reduce flooding within the Layer 2 VPN.

Type-3 Route: Inclusive Multicast route
The type-3 route is used to advertise the membership of a specific Layer 2 domain (VNI within the VXLAN domain), allowing the dynamic discovery of remote VTEPs in a specific VNI and the population of a VTEP ingress flood list for the forwarding of Broadcast Unknown unicast and Multicast (BUM) traffic.

Type-4 Route: Ethernet Segment Route
The type-4 route is specific to VTEPs supporting the EVPN multi-homing model, for active-active and active-standby forwarding. The route is used to discover VTEPs which are attached to the same shared Ethernet Segment. Additionally, this route type is used in the Designated Forwarder (DF) election process.

Type-5 Route: IP-prefix route advertisement
The type-5 route is used to advertise IP prefixes rather the MAC and IP hosts addresses of the type-2 route. This advertisement of prefixes into the EVPN domain provides the ability to build classic layer 3 VPN topologies.
A detailed understanding of the function of each of these route types in the operation of EVPN to provide multi-tenant Layer 2 and 3 VPN services, is defined in Section 4 of this document.

While this guide focuses on EVPN with VXLAN data-plane encapsulation, it’s important to note that, in addition to the new routes type, a BGP encapsulated extended community is included in all advertisements to determine the data-plane encapsulation.

The Encapsulation extended community is defined in RFC 5512. The different IANA registered tunnel types for an NVO environment are summarized in the table below.

![Figure 73: Defined Data-Plane Encapsulations](image)

17.1.2 EVPN Service Models

An EVPN instance (EVI), can contain, one or more Layer 2 broadcast domains (VLANs).

The association of a VLAN-IDs to a specific EVI instance and how a VLAN tag can be transported within the EVI if required, is defined by three EVPN service models: VLAN based, VLAN Bundle, and VLAN aware bundle.

17.1.2.1 VLAN Based Service Interface

In the VLAN based service there is a one-to-one mapping between the VLAN-ID and the MAC-VRF of the EVN instance. With the MAC-VRF mapping directly to the associated VLAN, there will be a single bridge table within the MAC-VRF. The VLAN tag is not carried in any route update and the VNI label in the route advertisement is used to uniquely identify the bridge domain of the MAC-VRF in the VXLAN forwarding plane.

![Figure 74: VLAN Based Service Interface](image)

With a one-to-one mapping between the VLAN-ID and the MAC-VRF of EVI instance, the EVI will represent an individual tenant subnet/VLAN in the overlay. The one-to-one mapping also means the
route-target associated with the MAC-VRF, uniquely identifies the tenant’s subnet/VLAN, providing granular importing of MAC routes on a per VLAN basis on each VTEP.

In this service, the associated MAC-VRF table is identified by the Route-Target in the control plane and by the VNI in the data plane and the MAC-VRF table corresponds to a single VLAN bridge domain.

17.1.2.2 VLAN Bundle Service Interface

In the VLAN bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. The MAC-VRF however only contains a single Layer 2 bridge table and VNI label, thus MAC addresses must be unique across all associated VLANs.

With the MAC-VRF containing a single Layer 2 bridge table and a single VNI, the original VLAN tag has no significance in the control plane and is not carried in any EVPN route update. The original Ethernet tag and the VNI label are carried in the VXLAN data plane, to allow forwarding to the correct tenant VLAN.

![VLAN Bundle Service Interface Diagram](image)

**Figure 75: VLAN Bundle Service Interface**

In this service, the Route-Target associated with the MAC-VRF identifies the tenant rather than an individual subnet/VLAN of a tenant. This means all MAC routes for the tenant will be imported on the VTEP regardless of whether or not the specific tenant VLAN exists. The MAC-VRF table is identified by the Route-Target in the control plane and forwarding to the appropriate tenant VLAN is achieved via a combination of the VNI and Ethernet tag in the VXLAN data plane.

17.1.2.3 VLAN Aware Bundle Service Interface

In the VLAN aware bundle service, there is a many-to-one mapping between the VLAN-IDs and the MAC-VRF of the EVPN instance. However, the MAC-VRF contains a unique Layer 2 bridge table for each associated VLAN-ID and a unique VNI label for each bridge domain.

With the MAC-VRF containing multiple Layer 2 bridge tables, the VLAN tag is carried in any EVPN route update to allow mapping to the correct tenant bridge table within the MAC-VRF. Only the unique VNI label is carried in the VXLAN data plane, to allow forwarding to the correct VLAN with the MAC-VRF.
In this service, the MAC-VRF of the EVI instance represents multiple subnet/VLANs of the tenant. The Layer 2 bridge table of the MAC-VRF is identified by a combination of the Route-Target and the Ethernet tag in the control plane and by the unique VNI and in the VXLAN data plane.

This service type is a common DCI/WAN deployment, where a tenant’s VLANs are bundled into single EVI instance, while VLAN “awareness” can be retained in the EVPN service as the VNI tag is advertised in the MAC-IP route (which now identifies the VLAN within the EVI). Bundling into a service like this reduces the number of EVI’s that need to be configured, reducing complexity and the control-plane signaling between PE’s.

17.1.3 VCS and EVPN in DCI

When VXLAN Control Services (VCS) is enabled on a CloudVision eXchange (CVX) of a Data Center (DC), each VXLAN Tunnel End Point (VTEP) connects to the corresponding CVX for sharing the Layer 2 bridging information of its attached hosts. In turn, CVX advertises this information to all VTEPs within the DC.

In a topology consisting of multiple DCs where each DC runs its own CVX instance as shown below, a federation of CVXs can be created by using BGP-EVPN. In such Data Center Interconnect (DCI) topologies, CVX in each DC performs the following functions to advertise the Layer 2 bridging information (MAC-VTEP bindings) to all VTEPs in different DCs:

- Receives the local Layer 2 bridging information in CVX control plane format from all VTEPs within the DC; and advertises it to remote CVXs in the BGP-EVPN NLRI format.
- Receives the Layer 2 bridging information in BGP-EVPN NLRI format from remote CVXs; and advertises it to local VTEPs in the CVX control plane format.

**Note:** The distribution of Layer 2 bridging information as described above allows a Layer 2 overlay network to be stretched across multiple DCs without additional VTEP configurations.

The following graphic illustrates the federation of CVX across multiple DCs.
17.1.4 EVPN MPLS LAYER 3 VPN (Type-5 Route)

Ethernet VPN (EVPN) is an extension of the BGP protocol introducing a new address family: Layer 2 VPN (address family number 25) / EVPN (subsequent address family number 70). It is used to exchange overlay MAC and IP address reachability information between BGP peers using type-2 routes. Additionally, EVPN supports the exchange of layer 3 IP overlay routes through the extensions described in (type 5 EVPN routes).

An IP VRF is used on a PE router for each layer 3 overlay. VRF IP routes are exported into the EVPN BGP table and advertised to remote VTEPs as type 5 routes. The exported EVPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the EVPN type 5 routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IP table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the layer 3 (type 5) EVPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by an IP backbone.

The type-5 routes provide the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP address, optimized the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The format of the new type-5 IP-prefix route is illustrated in the figure below. Unlike when VXLAN is used as a transport, BGP route update for MPLS does not specify the router-mac extended community and sets the tunnel encapsulation to MPLS. Unlike with VXLAN encapsulation, which uses the VNI as the overlay index, the MPLS Type-5 route uses the MPLS label.
Figure 78: EVPN Route Type-5, for Advertisement of IP-Prefixes over MPLS

The following example offers a more detailed view of the route as displayed on a PE router.

Figure 79: EVPN Route Type-5 as Shown on PE

As shown in the example, the route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the extended communities of tunnel type (MPLS), MPLS Label value and route-target.

Note: You require 4.21.1F release and later versions with Jericho/Jericho+ platforms.

17.1.5  EVPN VxLAN IPV6 Overlay

Beginning with EOS Release 4.22.0F, the EVPN VxLAN L3 Gateway using EVPN IRB supports routing traffic from one IPV6 host to another IPV6 host on a stretched VXLAN VLAN.

17.1.5.1  Platform Compatibility

Platforms supporting ND Proxy and ND Suppression:
- DCS-7280R/7280R2/DCS-7280R3/DCS-7500/DCS-7800 with R3 linecards
- DCS-7050CX3-32S-F
- DCS-7050SX3-48YC12-F (Starting in EOS Release 4.22.1F)
- DCS-7050SX3-48YC8 (Starting in EOS Release 4.22.1F)
- DCS-7050/7050X/7050X2 (Starting in EOS Release 4.22.1F)
- DCS-7260X/7260X3 (Starting in EOS Release 4.22.1F)
- DCS-7060X/7060X2 (Starting in EOS Release 4.22.1F)
- DCS-7250 (Starting in EOS Release 4.22.1F)
- DCS-7300/DCS-7320 (Starting in EOS Release 4.22.1F)
17.2 EVPN Layer 3 Core Operations

The EVPN standard defines a number of operations and functionality to allow the dynamic learning of MAC and IP bindings, management of MAC moves (VM/host mobility), ARP suppression, automated discovery of remote VTEPs and multi-homing to support active-active topologies.

17.2.1 MAC Address Learning

MAC address learning on the local interface of a VTEP is flow-based learning, however once the MAC addresses are learned locally they are advertised to BGP peers within the EVI via an EVPN route update. The next hop of the update is set to IP of the advertising VTEP. In the case of EVPN VXLAN the label advertised in the update is the VNI, which identifies the MAC-VRF in the case of a VLAN Based service, or the EVI for a VLAN aware bundle service.

Figure 80: EVPN Type 2 Route Announcement

The route advertisements are EVPN type-2 routes, which can advertise just the MAC address of the host, or optionally the MAC and IP address of the host. The format of the type-2 route is illustrated in the figure below, along with the mandatory and optional extended community attached to the route.

Figure 81: EVPN Type 2 MAC and IP Route Format

Notable fields:
• Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
• Route Distinguisher of the advertising node’s MAC-VRF.
• Ethernet Segment Identifier (ESI), this field is populated when the VTEP participating in a multi-homed topology. This is discussed in the following sections.
• Ethernet tag ID that will be 0 for VLAN-based service, and the customer VLAN ID in a VLAN-aware bundle service.
• IP address of the host which is associated with advertised MAC address. The advertisement of the Host’s IP address is optional.
• Label in the context of a VXLAN forwarding plane is the VNI associated with the MAC-VRF/Layer 2 domain the advertised MAC address has been learned on.
• Route Target associated with the MAC-VRF advertised with route to allow the control of the import and export of routes.

The MAC mobility extended community, as discussed in the following section is used during MAC moves to update all VTEPs of the new location of the host.

17.2.2 ARP Suppression

Providing the option to advertise the MAC and IP binding in the type-2 route, ARP suppression can be supported on the remote VTEPs. The MAC to IP binding can be learned locally, via ARP snooping or DHCP traffic on the VTEP. Once the MAC and IP binding has been learned, it is advertised to the remote VTEPs as a type-2 route. This allows remote VTEPs to respond to any ARP requests for the host locally, thus reducing the amount of ARP traffic across the EVI.

Importantly, the optional MAC and IP route can be advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, i.e. ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.

17.2.3 MAC Mobility

A common scenario in a data center environment is virtual machines (VMs) moving between physical servers, for maintenance or performance reasons, this will result in the MAC of the VM being learned and advertised by a new VTEP.

To cater for this situation a sequence number is attached to the new MAC advertisement ensuring an EVI wide refresh of the MAC table, with VTEPs updating their forwarding tables to point to the advertising VTEP as the new next-hop for MAC address.
When a MAC address is learned and advertised for the first time, it is advertised without a sequence number and the receiving VTEP assume the sequence to be zero. On detection of a MAC move, i.e. a MAC is learned locally when the same MAC route is active via a type-2 advertisement, then the sequence number is incremented by one, and the MAC route is advertised to the remote peers. The original advertising VTEP, receives the MAC route with a now higher sequence number and withdraws its own local MAC route. All other VTEPs flush the original MAC route, and update their tables with the new higher sequence number route.

17.2.4 MAC Address Damping

In addition to MAC mobility, EVPN defines a protection mechanism to detect and prevent MAC routes flapping between VTEPs, which can occur during network instability or when hosts have been mis-configured with the same (duplicate) MAC address.

On advertising a locally learned MAC, the VTEP will start a M second counter (default is 180s), if the VTEP detects N MAC moves (default is 5) for the route within the M second window, it will generate a syslog message and stop sending and processing any further updates for the route.

17.2.5 Broadcast and Multicast Traffic

Broadcast, unknown unicast and Multicast (BUM) traffic is handled within the EVPN forwarding model using ingress replication. Where the BUM frame is replicated on the ingress VTEP to each of the remote VTEPs in the associated EVI/VNI. The VTEP replication list for the EVI, is dynamically populated based on Type-3 route advertisements (Inclusive Multicast Ethernet Tag Route), where VTEPs advertise type-3 routes for each EVI they are members.
The format of the type-3 route is illustrated below.

Notable fields of the type-3 route:

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute of the route is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address (VTI) of the advertising VTEP.
- Route Distinguisher of the advertising node’s MAC-VRF.
- Ethernet tag that will be 0 for VLAN-based service, and the MAC-VRF VNI for a VLAN-aware bundle service.
- IP address of the VTEP advertising the type 3 route.
- Route Target associated with the MAC-VRF or the EVI in a VLAN-aware bundle service.
- PMSI Tunnel Attribute, to advertise the replication model the VTEP is supporting. The supported options defined within the standard are ingress replication and IP multicast.

### 17.3 Integrated Routing and Bridging

In the traditional data center design, inter-subnet forwarding is provided by a centralized router, where traffic traverse across the network to a centralized routing node and back again to its final destination. In a large multi-tenant data center environment this operational model can lead to inefficient use of bandwidth and sub-optimal forwarding.

To provide a more optimal forwarding model and avoid traffic tromboning, the EVPN inter-subnet draft ([draft-sajassi-l2vpn-evpn-inter-subnet-forwarding](#)) proposes integrating the routing and bridging (IRB)
functionality directly onto the VTEP, thereby allowing the routing operation to occur as close to the end host as possible. The draft proposes two forwarding models for the IRB functionality, which are termed asymmetric IRB and symmetric IRB, these two models are described in the following sections.

In the asymmetric IRB model, the inter-subnet routing functionality is performed by the ingress VTEP, with the packet after the routing action being VXLAN bridged to the destination VTEP. The egress VTEP only then needs to remove the VXLAN header and forward the packet onto the local Layer 2 domain based on the VNI to VLAN mapping. In the return path, the routing functionality is reversed with the destination VTEP now performing the ingress routing and VXLAN bridging operation, hence the term asymmetric IRB.

Figure 85: EVPN Asymmetric IRB

To provide inter-subnet routing on all VTEPs for all subnets, an anycast IP address is utilized for each subnet and configured on each VTEP. The anycast IP acts as the default gateway for the hosts, therefore regardless of where the host resides the directly attached VTEPs can act as the host’s default gateway. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisement from remote VTEPs.

In a typical implementation, the optional MAC and IP, type-2 route is advertised separately from the MAC only type-2 route. This is done so that if the MAC and IP route is cleared, for example the ARP flushed, or the ARP timeout is set to less than the MAC timeout, then the MAC only route will still exist.

The format of the two advertised type-2 routes for Server-1 are illustrated below, where the RD IP-A:1010 and route-target 1010:1010 are used to distinguish the uniqueness of the route and allow the route to be imported into the correct remote MAC-VRF based on the route-target import policy of the VTEP.
Ethernet VPN (EVPN)

Figure 86: EVPN Comparison of MAC & MAC+IP Type 2 Route in Asymmetric IRB

For the traffic flow between Server-1 in subnet-10 and Server-4 in subnet-11, the ingress VTEP (VTEP-1) locally routes the packet into subnet-11/VNI 1011 and then VXLAN bridges the frame, inserting the VNI 1011 into the VXLAN header with an inner DMAC equal to the destination host, Server-4. This requires the receiving VTEP, (VTEP-4) to only perform a local Layer 2 lookup, based on the VNI to VLAN mapping, for the DMAC of Server-4.

Figure 87: EVPN Asymmetric IRB VxLAN Data-plane Forwarding Detail

For the asymmetric model to operate the sending VTEP needs the information for all the tenant’s hosts (MAC and MAC to IP binding), to route and bridge the packet. This means the VTEP needs to be member of all the tenant’s subnets/VNI and have an associated SVI with anycast IP for all the
subnets, and this will be required on all VTEPs participating in the routing functionality for the tenant. This introduces scaling issues on multiple fronts.

- **VNI Scaling**: The number of VNIs supported on a hardware VTEP will be finite, so not all VNIs can reside on all VTEPs. This is especially true in data-center deployments, where the TOR’s have traditionally been more resource constrained than chassis-based edge systems.
- **Forwarding memory scaling**: The VTEPs needs to store all host MACs and ARP entries for all subnets in the network, on leaf switch this is hardware resource which again will be a finite resource defined by the specific hardware platform deployed at the leaf.

**Symmetric IRB**

To address the scale issues of the asymmetric model, in the symmetric model the VTEP is only configured with the subnets that are present on the directly attached hosts. Connectivity to non-local subnets on a remote VTEP is achieved through an intermediate IP-VRF. The subsequent forwarding model for symmetric IRB is illustrated in the figure below, for traffic between Server-1 on subnet-10 (Green) and Server-4 on the remote subnet-11 (Blue). In this model, the ingress VTEP routes the traffic between the local subnet-10) and the IP-VRF, which both VTEPs are a member of, the egress VTEP then routes the frame from the IP-VRF to the destination subnet. The forwarding model results in both VTEPs performing a routing function, hence the term symmetric IRB.

![Symmetric IRB Diagram](image)

**Figure 88: EVPN Symmetric IRB**

To provide the inter-subnet routing, when the subnet is stretched across multiple VTEPs, an anycast IP address is utilized for each subnet, but only configured on the VTEP’s where the subnet exists. The host MAC and MAC to IP bindings are learned by each VTEP based on a combination of local learning/ARP snooping and type-2 route advertisements.

For the symmetric IRB model the type-2 (MAC and IP) route is advertised with two labels and two route-targets corresponding to the MAC-VRF the MAC address is learned on and the IP-VRF. Remote VTEP’s receiving the route, import the IP host route into the corresponding IP-VRF based on the IP-VRF route-target and if the corresponding MAC-VRF exists on the VTEP the MAC address is imported into the local MAC-VRF based on the MAC-VRF’s Route-Target. The import behavior for the type-2 route is illustrated in the diagrams below for the host Server-1.

If the MAC-VRF exists locally on the receiving router, both the IP host route will be installed in the IP-VRF, and the MAC address will be installed in the MAC-VRF. As shown in Figure 30. With both a MAC route in the MAC-VRF and an IP host route in the IP-VRF, the VNI used in the data-path will depend on whether the traffic is being VXLAN bridged between hosts in the same VNI (1010) or VXLAN routed (VNI 2000).
Figure 89: EVPN Type 2 Route in Symmetric IRB - MAC-VRF on Both VTEPs

Compare this to the figure below, where the MAC-VRF does not exist on the receiving VTEP (VTEP-2). In this case the MAC route is not installed and ignored, as there is no corresponding Route Target on the VTEP. In this scenario, only the IP-VRF host route is installed on VTEP-2. Traffic from VTEP-2 destined to hosts on subnet-10, are therefore always VXLAN routed via the IP-VRF, VNI 2000.

Figure 90: EVPN Type 2 Route in Symmetric IRB - MAC-VRF Only Exists on Sending VTEP
The symmetric IRB type-2 route contains a number of additional extended community attributes over the asymmetric IRB type-2 route, the salient fields of the route are summarized below.

- Multi-protocol Reachable NLRI (MP_REACH_NLRI) attribute is used to carry the next-hop hop for the advertised route. In the context of a VXLAN forwarding plane, this will be the source address of the advertising VTEP.
- Route Distinguisher of the advertising node’s MAC-VRF. For Server-1 in the example above this would be IPA:1010.
- MAC address field contains the 48-bit MAC address of the host being advertised. For Server-1 in the example above this would be MAC-1.
- IP address and length field contain the IP address and 32-bit mask for the host being advertised. For Server-1 in the example above this would be IP-1.
- MAC-VRF label, this contains the VNI number (label) corresponding to the local Layer 2 domain/MAC-VRF the host MAC was learned on. For Server-1 in the example above this would be VNI 1010.
- IP-VRF label, this contains the VNI number (label) corresponding to the MAC-VRF’s associated IP-VRF. For MAC-VRF 10 in the example above this would be IP-VRF 2000.
- Extended community Route Target for the IP-VRF. This contains the route-target of the IP-VRF associated with the learned MAC address.
- Extended community Router MAC. This field advertises the system MAC of the advertising VTEP and is used as the DMAC for any packet sent to the VTEP via the IP-VRF.
- Extended community Route Target for the MAC-VRF. This contains the route-target of the MAC-VRF associated with the learned MAC address.

17.3.1 IP VPN

RFC 4364 allows Service Providers and Enterprises to use their backbone infrastructure to provide the services to multiple customers, or internal departments; while performing the following functions:

- Maintaining privacy
- Allowing for IP address overlap amongst customers
- Constraining route distribution - so that only the service provider routers which need the routes have them.

This is achieved through the usage of VRFs, Route Distinguishers and Route-Targets

The IPv4/IPv6 VPN Standard RFC 4364 does the following:

- Specifics an BGP IPv4 VPN control plane with a MPLS data plane
- BGP control plane, new address family to advertise IP VPN prefixes.
- This RFC obsoleted the original RFC 2547
- MPLS data-plane defined in multiple RFCs and drafts.

The RED circle in the figure below highlights the main Drafts and RFCs in use today for an MPLS data-plane.

![Figure 91: MPLS data-plane](image-url)

IPv4 VPN and IPv6 VPN are an extensions of the BGP protocol introducing new address families: IPv4 (address family number 1), IPv6 (address family number 2), and a subsequent address family number
Ethernet VPN (EVPN)

128: MPLS Layer 3 VPN unicast. It is used to exchange overlay IP prefix reachability information between MP-BGP peers.

Figure 92: IPv4 VPN and IPv6 VPN

IPv4 VPN defines two route types:
- Update
- Withdrawal

Each route type has its own NLRI prefix format and each route type advertises its own set of prefixes to update/withdraw.

The format of the IPv4 VPN prefix update route is illustrated in the following figure. As detailed, the update route contains the VPN route (prefix and RD), the next-hop for the route and the advertising router ID, along with the MPLS Label, along with a number of path attributes (where the RT extended communities are defined), which are associated with these IPv4 NLRIs.

Figure 93: IPv4 and IPv6 VPN Update Route Detail

The output in IPv4 VPN Route as Shown on PE and IPv6 VPN Route as Shown on PE offer a more detailed view of the route as displayed on a PE router.

Figure 94: IPv4 VPN Route as Shown on PE
The following is an illustration of a basic MPLS Layer 3 VPN topology.

Figure 96: MPLS Layer 3 VPN Topology

An IP VRF is used on a PE router for each customer (Layer 3 overlay). VRF IP routes are exported into the MP-BGP table and advertised to remote PEs as VPN routes. The exported VPN routes carry the Route-Target (RT) extended communities that are configured as export route-targets on the IP VRF from which they were exported.

The RTs carried by the VPN routes received by a PE are matched against the VRF import route-target configuration. When a received route carries an RT that is configured as an import route-target on an IP VRF, the route is imported into the IPv4 or IPv6 table for that VRF.

PE routers allocate per-VRF and address family Labels that are advertised as part of the VPN route NLRI. Forwarding of overlay packets between PEs across the underlay requires underlay MPLS connectivity provided by a backbone.

Note: You require 4.21.1F release and later versions with Jericho/Jericho+ platforms.

17.4 VPN MPLS Transport Options

EVPN-MPLS and IP-VPN sample topologies illustrate co-existing LDP, BGP-SR, and ISIS-SR on the core.
Figure 97: Physical Topology For ISIS-SR, LDP and BGP-SR Transport

LDP, ISIS-SR, and BGP-LU (BGP-SR) demonstrates the corresponding Label Switched Paths (LSPs) as the MPLS transport LSPs for Layer3 EVPN and IP VPN services.

EVPN Sample Topology

In the figures below Tenant-A DCI and Tenant-B DCI, the prefixes from each DC are transported over the WAN/DCI domain, maintaining the Layer 3 multi-tenancy in tenant-a and tenant-b.
To provide external connectivity from the DC into the MPLS domain, leaf-11 and leaf-12 are eBGP peering via the tenants VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and ip-prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (leaf-21 and leaf-2) re-advertise the prefixes into the tenant’s VRF via a type-5 route advertisement, with a next-hop equal to the advertising PE.

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the provider edge (PE) routers to identify a particular tenant.

EVPN MPLS Sample Configuration displays BGP route updates and how the tenant VRF is transported over these transport LSPs.

IP VPN Sample Topology

Let us review the concepts of transport labels, advertised to provide the label switched path, or LSP, across the back-bone and the VPN, or tenant label, used by the Provider Edge (PE) routers to identify a particular tenant.
In the figures **Tenant-D IPv4 VPN** and **Tenant-D IPv6 VPN**, the prefixes for VRF tenant-d are transported over the MPLS WAN between North Edge and South Edge routers.

![Figure 101: Tenant-D IPv4 VPN](image1)

![Figure 102: Tenant-D IPv6 VPN](image2)

### 17.4.1 LDP

The figure below illustrates how LDP neighbor relationships are built. First each router sends a discovery to a destination multicast address (TTL=1) 224.0.0.2 on port 646. This discovery contains the router-id and the transport IPv4 address the router wants to use. The second stage is building the TCP peering session using the transport IP addresses specified. This is normally loopback to loopback.
Examples

- The `show mpls ldp neighbor` command on the North Edge router displays more detail on TCP session establishment, and the local addresses of the LDP neighbor for which it is binding a label.

  Note: All connected interfaces are advertised as bound. However, EOS currently advertised labels for /32 addresses, and FEC filter is configured to install only x.x.x.200/32 prefixes.

```
North Edge.17:51:17# show mpls ldp neighbor
Peer LDP ID: 2.2.2.200:0; Local LDP ID: 1.1.1.200:0
  TCP Connection: 2.2.2.200:38395 - 1.1.1.200:646
  State: oper; Msgs sent/rcvd: 46/46; downstream unsolicited
  Uptime: 0:06:17
  KeepAlive expires in: 20.27 sec
  LDP discovery sources:
    Ethernet1/1
  Addresses bound to peer:
    2.2.2.200           2.2.2.2             192.168.1.177
    192.168.62.11
    192.168.1.181       192.168.58.12       192.168.60.11
    192.168.61.11

Peer LDP ID: 3.3.3.200:0; Local LDP ID: 1.1.1.200:0
  TCP Connection: 3.3.3.200:38510 - 1.1.1.200:646
  State: oper; Msgs sent/rcvd: 42/42; downstream unsolicited
  Uptime: 0:05:51
  KeepAlive expires in: 20.02 sec
  LDP discovery sources:
    Ethernet2/1
  Addresses bound to peer:
    192.168.65.11       192.168.59.12       3.3.3.200
    192.168.60.12
    192.168.63.11       3.3.3.3             192.168.64.11
```

- The `show mpls lfib route 116384` command on the North Edge router displays the label POP and swap operations for any traffic traversing North Edge. As can be seen if traffic came in with label 116384 it would be swapped to the labels seen in the tunnel table.

```
North Edge.23:38:28(config)# show mpls lfib route 116384
3024
```
MPLS forwarding table (Label [metric] Vias) - 1 routes
MPLS next-hop resolution allow default route: False

17.4.2  ISIS-SR

The figure below illustrates how ISIS-SR distributes the SID index information in the ISIS TLVs and sub-TLVs.

The Prefix SID index, SRGB, and ADJ SID values are populated in the sub-TLVs in the ISIS neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels) and locally assigned ADJ labels.

Examples
- The `show isis neighbors detail` command on the North Edge router displays the detailed information of all ISIS neighbors.

<table>

```

17.4.3 BGP-LU (BGP-SR)

BGP-LU Label Distribution illustrates how BGP-LU distributes the label information in BGP.
Ethernet VPN (EVPN)

Figure 105: BGP-LU Label Distribution

BGP-SR Index and SRGB Distribution illustrates how BGP-LU distributes the Label SRGB and SID index information in BGP. This is known as BGP-SR.

Figure 106: BGP-SR Index and SRGB Distribution

The Prefix SID index, and SRGB values are populated in the TLVs in the BGP neighbor updates. Each router then builds its own database of Node (Prefix) segments (Labels).
Examples

- The `show bgp neighbor` command displays BGP-SR neighbors.

```
north-edge#show bgp neighbor | include BGP neighbor|Multiprotocol IPv4 MplsLabel
BGP neighbor is 192.168.2.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: received
BGP neighbor is 192.168.3.9, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised and received and negotiated
BGP neighbor is 192.168.3.10, remote AS 64512, internal link
  Multiprotocol IPv4 MplsLabel: advertised
BGP neighbor is 192.168.58.12, remote AS 2, external link
  Multiprotocol IPv4 MplsLabel: advertised and received and negotiated
BGP neighbor is 192.168.59.12, remote AS 3, external link
```

- The `show ip bgp labeled-unicast 6.6.6.66/32 detail` command displays the detailed information of BGP labeled routes unicast with 6.6.6.66/32.

```
north-edge(config-if-Et2/1)#show ip bgp labeled-unicast 6.6.6.66/32 detail
BGP routing table information for VRF default

```

17.5 EVPN Type-5 Routes: IP Prefix Advertisement

The EVPN type 2 routes can be used to advertise IP prefixes by making use of the optional IP address and IP address length fields in the route, however they are explicitly linked to the MAC address advertised within the route. The EVPN type-5 route defined within the draft https://tools.ietf.org/html/draft-ietf-bess-evpn-prefix-advertisement-04, provides the ability to decouple the advertisement of an IP prefix from any specific MAC address, providing the ability to support floating IP address, optimize the mechanism for advertising external IP prefixes, and reduce the churn when withdrawing IP prefixes.

The figure below displays the format of the new type-5 IP-prefix route.
Figure 107: EVPN Route Type-5, for Advertisement of IP Prefixes

The IP prefix draft defines a number of specific uses cases for the type-5 route, which consequently affect the format and content of the fields within the route. The different deployment scenarios and use cases defined within the draft are summarized below.

- Advertising of IP prefixes behind an appliance, when the appliance is not running a routing protocol and only supporting static routes. This could be the typical use case for a Virtual Firewall with a number of local subnets directly attached, but the firewall is only supporting static routes into the associated EVI.
- Support for active-standby deployment of appliances using a shared floating IP model. This is an extension of the previous case where there is now a virtual IP (or VIP) for clustering the appliances, rather than a dedicated physical IP address on the appliance.
- Support for Layer 2 appliances, acting as a “bump in the wire” with no physical IP addresses configured, where instead of the appliances having an IP next-hop there is only a MAC next-hop.
- IP-VRF to IP-VRF model, which is similar to inter-subnet forwarding for host routes (detailed in the symmetric/asymmetric section), except only Type-5 routes and IP prefixes are advertised, allowing announcement of IP prefixes into a tenant’s EVI domain for external connectivity outside the domain.

Interface-less

In interface-less mode, the IP prefixes within the type-5 route, whether they are local or learned from a connected router are advertised to remote peers via the shared IP-VRF, as illustrated in the figure below. The IP-VRF to IP-VRF model, is further divided in the draft into three distinct use cases.
As illustrated above, the IP prefix (subnet-A) residing behind the router (Rtr-1) is learned via an IGP in EVI-1 on VTEP-1. The prefix is announced and learned by the remote VTEPs residing in the same EVI, via the type-5 route announcement. The type-5 route, is advertised along with the prefix, with a route-target (2000:2000) and a VNI label (2000) equal to the IP-VRF which interconnects the VTEPs in the EVI, the router-mac extended community of the route is used to define the inner DMAC (equal to system MAC of VTEP-1) for any VXLAN frame destined to advertised IP prefix.

From a forwarding perspective, host residing on subnet-B communicating with a host on subnet-A, will send traffic to their default gateway which is the IRB interface on VTEP-2 in VLAN 11/VNI 1011. VTEP-2 performs a route lookup for the destination subnet-A), which has been learned in the IP-VRF with a next-hop of VTEP-1 and VNI label of 2000. The packet is thus VXLAN encapsulated with VNI label of 2000 an inner DMAC of A (VTEP-1 system/router MAC), and routed to VTEP-1, which is the next-hop for the prefix. Receiving the frame, VTEP-1 de-encapsulates the packet, with an inner DMAC of the VTEPs router MAC, it performs a local route lookup for the destination subnet-A), which has been learned with a next-hop of rtr-1. The frame is forwarded directly to rtr-1, which subsequently routes the packet to the local host on subnet-A. The format of the type-5 route in interface-less mode is illustrated in figure below.
In this model, the VTEPs forming the EVI are interconnected via an IP-VRF, meaning there is no IRB interface (MAC and IP) created for the interconnection on each of the VTEPs, hence the term “interface-less”. With no IRB interface the gateway IP address within the type-5 route is set to zero, traffic is routed to the prefix based on the next-hop of the route (VTEP IP) as well as MAC address conveyed within the Router MAC extended community, which represents the inner destination MAC of the VXLAN encapsulated frame.

17.6 Inter-VRF Local Route Leaking

Inter-VRF local route leaking allows the leaking of routes from one VRF (the source VRF) to another VRF (the destination VRF) on the same router. Inter-VRF routes can exist in any VRF (including the default VRF) on the system. Routes can be leaked using the following methods:

- Inter-VRF Local Route Leaking using BGP VPN
- Inter-VRF Local Route Leaking using VRF-leak Agent

17.6.1 Inter-VRF Local Route Leaking using BGP VPN

Inter-VRF local route leaking allows the user to export and import routes from one VRF to another on the same device. This is implemented by exporting routes from a VRF to the local VPN table using route target extended community list and then importing the same route target extended community lists from the local VPN table into the target VRF. VRF route leaking is supported on VPN-IPv4, VPN-IPv6, and EVPN types.
To access shared resources across VPNs, all the routes from the shared services VRF must be leaked into each of the VPN VRFs and customer routes must be leaked into the shared services VRF for return traffic. Accessing shared resources allows one to export the route target of the shared services VRF into all customer VRFs, and allows the shared services VRF to import route targets from customers A and B. The figure below shows how to provide customers, corresponding to multiple VPN domains, access to services like DHCP available in the shared VRF.

Route leaking across the VRFs is supported on VPN-IPv4, VPN-IPv6, and EVPN.

17.6.1.1 Configuring Inter-VRF Local Route Leaking

Inter-VRF local route leaking is configured using VPN-IPv4, VPN-IPv6, and EVPN. Prefixes can be exported and imported using any of the configured VPN types. Ensure that the same VPN type that is exported is used while importing.

Leaking unicast IPv4 or IPv6 prefixes is supported and achieved by exporting prefixes locally to the VPN table and importing locally from the VPN table into the target VRF on the same device as shown in the figure titled Inter-VRF Local Route Leaking using Local VPN Table using the route-target command.
Exporting or importing the routes to or from the EVPN table is accomplished with the following two methods:

- Using VXLAN for encapsulation
- Using MPLS for encapsulation

### Using VXLAN for Encapsulation

To use VXLAN encapsulation type, ensure that VRF to VNI mapping is present and the interface status for the VXLAN interface is up. This is the default encapsulation type for EVPN.

Example:

- The configuration for VXLAN encapsulation type is as follows:

```plaintext
switch(config)#router bgp 65001
switch(config-router-bgp)#address-family evpn
switch(config-router-bgp-af)#neighbor default encapsulation vxlan next-hop-self source-interface Loopback0

switch(config)#hardware tcam
switch(config-hw-tcam)#system profile vxlan-routing
switch(config-hw-tcam)#interface Vxlan1
switch(config-hw-tcam-if-Vx1)#vxlan source-interface Loopback0
switch(config-hw-tcam-if-Vx1)#vxlan udp-port 4789
switch(config-hw-tcam-if-Vx1)#vxlan vrf vrf-blue vni 20001
switch(config-hw-tcam-if-Vx1)#vxlan vrf vrf-red vni 10001
```

### Using MPLS for Encapsulation

To use MPLS encapsulation type to export to the EVPN table, MPLS needs to be enabled globally on the device and the encapsulation method needs to be changed from default type, that is VXLAN to MPLS under the EVPN address-family sub-mode.

Example:

- switch(config)#router bgp 65001
- switch(config-router-bgp)#address-family evpn
- switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self source-interface Loopback0

### 17.6.1.2 Route-Distinguisher

Route-Distinguisher (RD) is used to uniquely identify routes from a particular VRF. Route distinguisher is configured for every VRF from which routes are exported from or imported into.

The following commands are used to configure route distinguisher for a VRF:

```plaintext
Switch(config-router-bgp)#vrf vrf-services
Switch(config-router-bgp-vrf-vrf-services)#rd 1.0.0.1:1

Switch(config-router-bgp)#vrf vrf-blue
Switch(config-router-bgp-vrf-vrf-blue)#rd 2.0.0.1:2
```

### 17.6.1.3 Exporting Routes from a VRF

Use the `route-target export` command to export routes from a VRF to the local VPN or EVPN table using the route target extended community list.
Examples

• These commands export routes from vrf-red to the local VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
```

• These commands export routes from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
```

17.6.1.4 Importing Routes into a VRF

Use the `route-target import` command to import the exported routes from the local VPN or EVPN table to the target VRF using the route target extended community list.

Examples

• These commands import routes from the VPN table to vrf-blue.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
```

• These commands import routes from the EVPN table to vrf-blue.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
```

17.6.1.5 Exporting and Importing Routes using Route Map

To manage VRF route leaking, control the prefixes that are exported and imported with route-map export or import commands. The route map is effective only if the VRF paths or the VPN paths are already candidates for export or import. It is mandatory to have the route-target export or import command configured first. Setting BGP attributes using route maps is effective only on the export end.

Note: Prefixes that are leaked are not re-exported to the VPN table from the target VRF.

Examples
• These commands export routes from vrf-red to the local VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 route-map EXPORT_V4_ROUTES_T0_VPN_TABLE
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 route-map EXPORT_V6_ROUTES_T0_VPN_TABLE
```

• These commands export routes to from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-map EXPORT_ROUTES_T0_EVPN_TABLE
```

• These commands import routes from the VPN table to vrf-blue.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 1:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 route-map IMPORT_V4_ROUTES_VPN_TABLE
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 route-map IMPORT_V6_ROUTES_VPN_TABLE
```

• These commands import routes from the EVPN table to vrf-blue.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn route-map IMPORT_ROUTES_FROM_EVPN_TABLE
```

### 17.6.2 Inter-VRF Local Route Leaking using VRF-leak Agent

Inter-VRF local route leaking allows the leaking of routes from one VRF to another using route map as a VRF-leak agent. VRFs are leaked based on the preferences assigned to each VRF.

#### 17.6.2.1 Configuring Route Maps

Use `router general` command to configure route maps to leak routes from one VRF to another. Routes in VRF “VRF1” that match the policy “RM1” are considered for leaking into VRF “VRF2”. If two
or more policies specify leaking the same prefix to the same destination VRF, then the route with a higher (post-set-clause) distance and preference is chosen.

**Example**

These commands configure a route-map to leak routes from "VRF1" to "VRF2" using a route-map "RM1".

```text
switch(config)#router general
switch(config-router-general)#vrf VRF2
switch(config-router-general-vrf-VRF2)#leak routes source-vrf VRF1 subscribe-policy RM1
```

## 17.7 Static Inter-VRF Route

The Static Inter-VRF Route feature adds support for static inter-VRF routes. This enables the configuration of routes to destinations in one ingress VRF with an ability to specify a next-hop in a different egress VRF through a static configuration.

You can configure static inter-VRF routes in default and non-default VRFs. A different egress VRF is achieved by “tagging” the “next-hop” or “forwarding via” with a reference to an egress VRF (different from the source VRF) in which that next-hop should be evaluated. Static inter-VRF routes with ECMP next-hop sets in the same egress VRF or heterogenous egress VRFs can be specified.

The Static Inter-VRF Route feature is independent and complementary to other mechanisms that can be used to setup local inter-VRF routes. The other supported mechanisms in EOS and the broader use-cases they support are documented here:

- [Local Route leaking using BGP VPN](#)
- [Local Route leaking using EOS RouteLeak Agent](#)

### 17.7.1 Platform Compatibility

Static inter-VRF routes are supported on all EOS devices, but only with the routing system in the multi-agent mode.

### 17.7.2 Configuration

The configuration to setup static-Inter VRF routes in an ingress (source) VRF to forward IP traffic to a different egress (target) VRF can be done in the following modes:

- This command creates a static route in one ingress VRF that points to a next-hop in a different egress VRF.

  ```text
  switch(config)#ip|ipv6 route [vrf vrf-name destination-prefix [egress-vrf egress-next-hop vrf-name] next-hop
  ```

- This command creates a static route in one ingress VRF that points to an exit interface in a different egress VRF.

  ```text
  switch(config)#ip|ipv6 route [vrf vrf-name] destination-prefix [egress-vrf egress-interface vrf-name] interface
  ```
• This command creates a static route in one ingress VRF that points to a next-hop that is bound to an interface in a different egress VRF.

```
switch(config)#ip|ipv6 route [vrf vrf-name] destination-prefix [egress-vrf egress-interface vrf-name] interface
```

### 17.7.3 Show Commands

Use the `show ip route vrf` to display the egress VRF name if it is different from the source VRF.

**Example**

```
#show ip route vrf vrf1

VRF: vrf1
Codes: C - connected, S - static, K - kernel,
      O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type2, B - BGP, B I - iBGP, B E -
      eBGP, R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
      NG - Nexthop Group Static Route, V - VXLAN Control
      Service,
      DH - DHCP client installed default route, M - Martian,
      DP - Dynamic Policy Route, L - VRF Leaked

Gateway of last resort is not set

S  1.0.1.0/24 [1/0] via 1.0.0.2, Vlan2180 (egress VRF default)
S  1.0.7.0/24 [1/0] via 1.0.6.2, Vlan2507 (egress VRF vrf3)
```

### 17.7.4 Limitations

For bidirectional traffic to work correctly between a pair of VRFs, static inter-VRF routes in both VRFs must be configured.

### 17.8 VCS to EVPN Hitless Migration

VCS to EVPN Hitless Migration enables support for migrating from only using VCS as the control plane to only using EVPN as a control plane in a hitless manner with respect to L2 reachability information.

#### 17.8.1 Platform Compatability

VCS to EVPN hitless migration is platform independent. It is subject to all platform compatability limitations of both VCS nd EVPN.

#### 17.8.2 Configuration

To configure VCS to EVPN hitless migration, assume that initially only VCS is configured as the control plane. Complete the following migration process.

1. Check VCS L2 reachability information in L2Rib.
Use the following show commands to verify that L2 reachability information is in L2Rib's input and output:

- `show l2Rib input vxlan-control-service`
- `show l2rib input vxlan-control-service floodset`
- `show l2rib output`
- `show l2rib output floodset`

Also, verify that the L2 reachability information received from VCS is in the proper address tables using:

- `show mac address-table`
- `show vxlan address-table`
- `show vxlan flood vtep`

2. Configure EVPN.

See [https://eos.arista.com/eos-4-18-1f/evpn-vxlan/](https://eos.arista.com/eos-4-18-1f/evpn-vxlan/) for details on EVPN configuration.

3. Check L2Rib for L2 reachability information from both VCS and EVPN.

- For each MAC reachability entry received from VCS in L2Rib's input, there is an identical entry received from EVPN. Verify that entries received from VCS and EVPN in L2Rib's input are identical using the `show l2Rib input all` command.
- The floodset received from VCS in L2Rib's input include local VTEP IPs, while the floodset received from EVPN does not. Use the `show l2Rib input all floodset` command to check for identical floodset VTEP IPs (excluding local VTEP IPs).
- L2Rib's output now includes MAC reachability information received from EVPN, instead of the ones received from VCS. Verify this using the `show l2rib output` command.
- Verify that `show l2rib output floodset` output displays the same floodsets as when only VCS was configured as the control plane. Verify that information from L2Rib's output has been conveyed to the proper address tables using the following show commands:
  
  - `show mac address-table`
  - `show vxlan address-table`
  - `show vxlan flood vtep`

4. Gracefully shutdown VCS.

There are two options for shutting down VCS.

- The first option is to simply shutdown VCS using the `shutdown` command on the CVX node. However, if L2 reachability information is different from when only VCS is configured as the control plane (such as, due to EVPN misconfiguration), VCS must be reconfigured as a whole to rollback.
- The second option is to use a more gradual approach. To aid in importing only EVPN control plane information in particular L2 domains, a new configuration option was recently added to inhibit the import of VCS reachability information into specified VLANs. This configuration is in the VXLAN interface configuration mode, and is as follows:

```
switch(config)#interface vxlan1
switch(config-if-Vx1)#vxlan controller-client import vlan none
switch(config-if-Vx1)#vxlan controller-client import vlan
import_enabled_vlans
switch(config-if-Vx1)#vxlan controller-client import vlan add
import_enabled_vlans
switch(config-if-Vx1)#vxlan controller-client import vlan
remove import_disabled_vlans
```

The commands above operate on a set of "import VLANs", or VLANs where the import of reachability information from VCS is allowed, with the following behavior:
Ethernet VPN (EVPN)

- **none** disables import from all VLANs.
- simply specifying `import_enabled_vlans` results in replacing the set of allowed VLANs with `import_enabled_vlans`.
- `add import_enabled_vlans` adds `import_enabled_vlans` to the current set of allowed VLANs.
- `remove import_disabled_vlans` removes `import_disabled_vlans` from the current set of allowed VLANs.
- having the prefix **no** or **default** re-enables import from all VLANs.

Any of the CLI subcommands that take a list take it in the form of a VLAN multi-range string (such as, “1-4094”, “1,5-100”, “1-30,500-1000”, etc.)

Gradually inhibiting the import of VCS reachability information can be done using the above commands. For example, use the `vxlan controller-client import vlan remove 100` command to inhibit the import of VCS reachability information subject to VLAN 100. To rollback, use the `vxlan controller-client import vlan add 100` command.

For each step of inhibiting the import of VCS reachability information, L2Rib’s input/output and proper address-tables must be checked for correctness. The number of inhibited VLANs per step should be determined by the personnel who are performing the migration.

After verifying that all reachability information from VCS has been removed from L2Rib’s input, use the `shutdown` command on the CVX node to gracefully shutdown VCS.

5. Disable controller-client mode on each switch.

VCS is shutdown, so each switch should no longer consider VCS as a control plane. This can be accomplished using the following command on each switch:

```
switch(config)#interface vxlan1
switch(config-if-Vx1)#no vxlan controller-client
```

17.8.3 Show Commands

The show commands used for the migration process are:

- `show l2Rib input vxlan-control-service`
- `show l2rib input vxlan-control-service floodset`
- `show l2rib input all`
- `show l2rib input all floodset`
- `show l2rib output`
- `show l2rib output floodset`
- `show mac address-table`
- `show vxlan address-table`
- `show vxlan flood vtep`

To enable the user to quickly view which control planes and sources are importing reachability information into which VLANs, use the following show command:

```
show vxlan control-plane [import | export] [vlan vlan_id]
```

This command displays a list of VLANs active in VXLAN on the device, along with which control planes are active in each VLAN, whether local reachability information is being advertised in a control plane (export), whether remote reachability information is being learned from a control plane (import), and what source (static configuration from CLI, VCS, EVPN, etc.) enabled distribution or learning in that VLAN. The `import` or `export` keywords may be provided to filter the output to only show sources that are importing from or exporting to the listed VLANs, respectively, and a VLAN multi-range string may be provided to filter the output to only show a subset of active VLANs.
17.8.4 Limitations
If the routing model is not set to the multi-agent model when only the VCS is configured as the control plane, switches may require a reboot during EVPN configuration to make the migration no longer hitless.

17.9 Configuring EVPN
17.9.1 Configuring BGP-EVPN and VCS on CVX
17.9.1.1 Configuring BGP-EVPN

Configuring VNI Bundle
A VNI-aware-bundle represents a MAC-VRF that contains Layer 2 route entries from all VXLAN Network Identifiers (VNI) available across multiple DCs. Use the vni-aware-bundle command available on CVX to create a MAC-VRF.

Note: This command is not available on switches.

Example

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
```

Configuring RD and RT in VNI Bundle
Use the rd (Router-BGP VRF and VNI Configuration Modes) command to add a Route Distinguisher (RD) for uniquely identifying Layer 2 routes for the VNI bundle. Use the route-target command to configure a well-known extended community that is attached to the routes exported by BGP-EVPN, and to import routes with the specified well-known extended community into the MAC-VRF that corresponds to the VNI bundle.

Example

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)# rd 530:12
cvx(config-macvrf-bundle1)# route-target both 530:12
```

Enabling Redistribution of Bridging Information
After the VNI aware bundle is created, use the redistribute service vxlan command to redistribute the Layer 2 bridging information received from VCS.

Example

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#redistribute service vxlan
```
Disabling Next-Hop Resolution in BGP-EVPN

When BGP-EVPN module receives a route from its BGP peer, it generally tries to resolve the next-hop indicated in the route. However in the DCI topology, the routes coming from a CVX in another DC contains next-hops (VTEP addresses) that may not be reachable from the CVX receiving the route.

Use the `next-hop resolution disabled` command to disable the next-hop resolution on routes received from BGP-EVPN peers.

---

**Note:** CVX is a part of the control plane and it is only connected to the VTEPs in its own DC. It does not have IP connectivity to the VTEPs in a different DC.

---

**Example**

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#address-family evpn
cvx(config-router-bgp-af)#next-hop resolution disabled
```

17.9.2 Configuring VCS

Enabling Redistribution of BGP-EVPN Routes

Use the `redistribute bgp evpn vxlan` command to redistribute BGP-EVPN routes to VCS, which, in turn advertises them to all VTEPs within the DC.

**Example**

```
cvx(config)#cvx
cvx(config-cvx)#no shutdown
cvx(config-cvx)#service vxlan
cvx(config-cvx-vxlan)#no shutdown
cvx(config-cvx-vxlan)#redistribute bgp evpn vxlan
```

17.10 Sharing Equivalence Class entry across multiple VRF

This enables the sharing of the same Forwarding Equivalence Class (FEC) entry across multiple VRF’s and achieves higher scale in VPN deployments by making optimal use of hardware resources. The VPN path routes are imported to multiple VRF for MPLS VPN address family in BGP, individual FEC entry in the hardware table is used for each VRF.

The following configuration in router BGP mode at BGP instance level allows sharing FEC, when the VPN path is imported to multiple VRFs.

```
switch# bgp fec skip in-place update
```

The following configures disable FEC and restores default configuration.

```
switch#[no| default] bgp fec skip in-place update
```

---

**Note:** Changing the configuration in a production system may increase FEC usage.

The following example displays BGP VPN-IPv4 routes for prefix 20.0.1.0/24, which is imported to four VRFs.

```
switch #show bgp vpn-ipv4 20.0.1.0/24 detail
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
```
BGP routing table entry for IPv4 prefix 20.0.1.0/24, Route Distinguisher: 11.0.1.1:0
Paths: 1 available
301
11.0.1.1 from 10.0.0.2 (0.0.1.1)
Origin IGP, metric -, localpref 100, weight 0, valid, external, best
Extended Community: Route-Target-AS:300:0 Route-Target-AS:301:0
MPLS label: 116507

This route was using 4 FEC entries for each VRF before the change.

```
switch# show platform jericho ip route 20.0.1.0/24
Tunnel Type: M(mpls), G(gre), MoG(mpls-over-gre), vxlan-o(vxlan outer-rewrite info), vxlan-i(vxlan inner-rewrite info)
* - Routes in LEM
D - ECMP is divergent across switching chips
-----------------------------------------------------------------------------------------------------------------------
| VRF | Destination   |     |                    |     |       |
| ECMP|  FEC | Tunnel  |                      |     |       |
| ID | Subnet | Cmd | Destination | VID | Outlif | MAC /
CPU Code | Index | Index | T Value
-----------------------------------------------------------------------------------------------------------------------
| 1  | 20.0.1.0/24 | ROUTE| FEC 32776 | 0    |  -    |
|  -  | 49152 |M 116507
| 2  | 20.0.1.0/24 | ROUTE| FEC 32776 | 0    |  -    |
|  -  | 49154 |M 116507
| 3  | 20.0.1.0/24 | ROUTE| FEC 32776 | 0    |  -    |
|  -  | 49155 |M 116507
| 4  | 20.0.1.0/24 | ROUTE| FEC 32776 | 0    |  -    |
|  -  | 49156 |M 116507
```

The following uses single FEC entry For VPN routes imported to all VRFs after configuring `bgp fec skip in-place update event all` command.

```
switch# show platform jericho ip route 20.0.1.0/24
Tunnel Type: M(mpls), G(gre), MoG(mpls-over-gre), vxlan-o(vxlan outer-rewrite info), vxlan-i(vxlan inner-rewrite info)
* - Routes in LEM
D - ECMP is divergent across switching chips
-----------------------------------------------------------------------------------------------------------------------
| VRF | Destination   |     |                    |     |       |
| ECMP|  FEC | Tunnel  |                      |     |       |
| ID | Subnet | Cmd | Destination | VID | Outlif | MAC /

-----------------------------------------------------------------------------------------------------------------------
| 1  | 20.0.1.0/24 | ROUTE| FEC 32780 | 0    |  -    |
|  -  | 49152 |M 116507
```
### 17.11 Sample Configurations

#### 17.11.1 EVPN VXLAN IRB Sample Configuration

In the topology below, we are connecting a Layer 2 site with a Layer 3 site using Layer 3 EVPN (type-5 route). Right side leaves are MLAG leaves and have SVI 10 in VRF-Blue. A number of directly connected hosts are simulated behind the right side leaf. The left side leaves are individual leaves that connect with a remote switch in vrf VRF-Blue to learn Layer 3 routes using BGP. The left side leaves are configured as two independent Layer 3 only VTEPs.

![Layer 3 EVPN Configuration](image)

To provide VXLAN routing and bridging between the two MLAG domains, each leaf switch is EVPN peering with the four spine switches via a loopback interface.

**eBGP Underlay Configuration: Leaf-11**

Underlay configuration is straightforward and all neighbors are eBGP. Since all leaves share the same AS number, the `allowas-in` command was added in the leaf.

```plaintext
interface Ethernet1
description Spine-1-et1/1
```
mtu 9214
no switchport
ip address 172.168.1.1/31

interface Ethernet8/1
description ck428-et8/1
speed forced 40gfull
no switchport
ip address 172.168.1.10/31

interface Loopback0
ip address 1.1.1.11/32

ip prefix-list loopback
  seq 10 permit 1.1.1.0/24 ge 24
!
route-map loopback permit 10
  match ip address prefix-list loopback

  neighbor SPINE remote-as 65001
  neighbor SPINE allowas-in 1
  neighbor SPINE soft-reconfiguration inbound all
  neighbor SPINE send-community
  neighbor 172.168.1.0 peer-group SPINE
  neighbor 172.168.1.11 remote-as 65003
  redistribute connected route-map loopback

**eBGP Underlay Configuration: Spine-1**

interface Ethernet1/1
description Leaf-11-et1
mtu 9214
no switchport
ip address 172.168.1.0/31

interface Loopback0
  ip address 1.1.1.1/32

  ip prefix-list loopback
  seq 10 permit 1.1.1.0/24 ge 24
  !
  route-map loopback permit 10
  match ip address prefix-list loopback
  !
  router bgp 65001
  neighbor 172.168.1.1 remote-as 65004
  redistribute connected route-map loopback

**VRF Configuration: Leaf-11**

VRF-Blue is configured on all the left leaves. The left leaves have pure Layer 3 interfaces and the right side has SVI 10.

vrf instance VRF-Blue
ip routing vrf VRF-Blue
interface Ethernet36
  no switchport
vrf VRF-Blue
   ip address 172.168.1.9/31

router bgp 65004
   vrf VRF-Blue
   neighbor 172.168.1.8 remote-as 65005

VRF Configuration: Leaf-21

vlan 10
vrf instance VRF-Blue
ip routing vrf VRF-Blue

interface Vlan10
   vrf VRF-Blue
      ip address virtual 10.10.10.1/24

   ip virtual-router mac-address 00:aa:aa:aa:aa:aa

interface Port-Channel3
   switchport mode trunk
   mlag 3

VXLAN Configuration: Leaf-11

Make sure all VTEPs have unique loopback0 addresses to represent unique VTEP identifiers. For every VNI that EVPN receives, a dynamic VLAN is allocated, so it is a good practice to keep the same VNI.

interface Vxlan1
   vxlan source-interface Loopback0
   vxlan udp-port 4789
   vxlan vrf VRF-Blue vni 10001

VXLAN Configuration: Leaf-21

interface Vxlan1
   vxlan source-interface Loopback0
   vxlan udp-port 4789
   vxlan vrf VRF-Blue vni 10001

EVPN Configuration: Leaf-11

Leaf establishes the EVPN neighborship with all 4 spines for redundancy. EVPN neighborship is on the loopback address and the multihop keyword is used. Make sure to disable the IPv4 address family for EVPN neighbors.

Since the spine is acting like a route-reflector for EVPN routes, make sure to configure the next-hop-unchanged.

        no neighbor SPINE_EVPN activate

Advertise VRF Routes in EVPN: Leaf-11

By configuring VRF under router bgp, you are advertising routes from that VRF into EVPN using the RD/RT. The remote end can install the route by importing the RT.

Leaf-11 has routes in VRF-Blue learned through eBGP with the neighbor down south. Since the routes are already in BGP VRF table, we don't to configure the redistribute command.

router bgp 65004
    neighbor SPINE_EVPN peer-group
    neighbor SPINE_EVPN remote-as 65001
    neighbor SPINE_EVPN update-source Loopback0
    neighbor SPINE_EVPN ebgp-multihop 3
    neighbor SPINE_EVPN send-community extended
    neighbor SPINE_EVPN maximum-routes 12000
    neighbor 1.1.1.1 peer-group SPINE_EVPN
    !
Advertise VRF Routes in EVPN: Leaf-21

On the other hand Leaf-21 wants to export the connected SVI into EVPN and hence require `redistribute connected` command.

```
router bgp 65002
    neighbor SPINE_EVPN peer-group
    neighbor SPINE_EVPN remote-as 65001
    neighbor SPINE_EVPN update-source Loopback0
    neighbor SPINE_EVPN allowas-in 1
    neighbor SPINE_EVPN ebgp-multihop 3
    neighbor SPINE_EVPN send-community extended
    neighbor SPINE_EVPN maximum-routes 12000
    neighbor 1.1.1.1 peer-group SPINE_EVPN

    address-family evpn
        neighbor SPINE_EVPN activate

    address-family ipv4
        no neighbor SPINE_EVPN activate
```

17.11.2  Multi-Tenant EVPN VXLAN IRB Sample Configuration

The following configuration example shows a deployment using both symmetric and asymmetric IRB with VLAN-based and VLAN-aware bundle services; and eBGP overlay and underlay.
Figure 113: Tenant-A: Symmetric IRB
In the symmetric and asymmetric IRB configurations illustrated in the figures above, for Tenant-A, four subnets are stretched across the two MLAG domains with two subnets (VLAN 10, 10.10.10.0/24 and VLAN 11, 10.10.11.0/24) configured as a VLAN-based service, and two other subnets (VLAN 12, 10.10.12.0/24 and VLAN 13, 10.10.13.0/24) as a VLAN-aware bundle service.

For Tenant-B, four subnets are stretched across the two MLAG domains with two subnets (VLAN 210, 10.10.10.0/24 and VLAN 211, 10.10.11.0/24) configured as a VLAN-based service, and two other subnets (VLAN 212, 10.10.12.0/24 and VLAN 213, 10.10.13.0/24) as a VLAN-aware bundle service.

In addition each MLAG domain has a single local subnet (Rack-1 subnet 10.10.20.0/24 and Rack-2 subnet 10.10.21.0/24) for the tenant. To provide direct distributed routing, each leaf switch is configured with the same virtual IP address for the four stretched subnets. For the local-only subnets, the virtual IP address is configured in both physical leaf switches of the relevant MLAG domain.

For each MLAG domain, a logical VTEP is created with the same shared loopback address. For Rack-1, the logical VTEP IP is 2.2.2.1 and for the Rack-2, the logical VTEP IP is 2.2.2.2. Directly connected to each leaf switch is a host, which is a member of one of the two IP subnets. To provide Layer 2 connectivity across the racks, VXLAN bridging is enabled by mapping VLAN to VNIs as detailed in the diagram.
To provide IP connectivity across all subnets both stretched and directly connected, an IP-VRF is shared between the two MLAG domains for the tenant. This is used as a transit network for announcing and forwarding the locally attached subnets. Each leaf switch is EVPN peering with the four spine switches via a loopback interface on the leaf and again on the spine switches. To provide external connectivity, Leaf-11 and Leaf-12 are eBGP peering via the tenants’ VRFs with the border routers. Both core routers are advertising external prefixes for Internet and any remote site connectivity (default route and IP prefixes from the other DC for the tenant). To provide connectivity within the EVPN domain, the leaf switches (Leaf-21 and Leaf-22) re-advertise the prefixes into the tenant’s VRF via a type-5 route advertisement, with a next-hop equal to the advertising VTEP.

17.11.2.1 MLAG Configuration: Leaf-11 and Leaf-12

```

17.11.2.3 VLAN and Distributed IP Address Configuration: Leaf-11 and Leaf-21

VLAN and interface configuration for VLAN 10 (virtual IP address 10.10.10.254) and VLAN 11 (virtual IP address 10.10.11.254), along with SVIs 12, 13 and 20, are similarly configured. To provide multi-tenancy, the two tenant VLANs are placed in a dedicated VRF, named “Tenant-A.” A further five tenant VLANs are configured and assigned to VRF “Tenant-B.”

The other VLANs are for peering, MLAG, and a unique VLAN SVI. These VLANs do not use virtual IP addresses.

The tenants’ stretched subnets (Tenant-A: VLANs 10,11,12 and 13; Tenant-B: VLANs 210, 211, 211, 212 and 213) are mapped to unique overlay VXLAN VNIs. The tenants’ IP-VRF (Tenant-A and Tenant-B) is associated with a VNI using the `vxlan vrf` command under the VXLAN interface. In the forwarding model for symmetric IRB, this VNI will be used as the transit VNI for routing to subnets which are not locally configured on the VTEP.

As a standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain, Rack-1 (Leaf-11 + Leaf-12) has a shared logical VTEP IP of 2.2.2.1 and Rack-2 (Leaf-21 + Leaf-22) has a shared logical VTEP IP of 2.2.2.2

Leaf-11 VLAN and Distributed IP Address Configuration

```conf

  vrf tenant-b
17.11.2.4 VXLAN Interface Configuration: Leaf-11 and Leaf-21

The tenants’ VLANs are mapped to unique overlay VXLAN VNIs. VLAN 10 is mapped to VNI 1010 on both MLAG domains, and VLAN 11 is mapped to VNI 1011. As standard MLAG configuration, both leaf switches in each MLAG domain share the same logical VTEP IP address. Thus MLAG domain Rack-1 (Leaf-11 + Leaf-12) has a shared logical VTEP IP of 2.2.2.2.1 and Rack-2 (Leaf-21 + Leaf-22) has a shared logical VTEP IP of 2.2.2.2. Also configured is the VRF-to-VXLAN mapping for Tenant-A.

Leaf-11 VXLAN Interface Configuration

```bash
! interface Loopback1
   ip address 2.2.2.1/32
!
interface Vxlan1
  vxlan source-interface Loopback1
  vxlan udp-port 4789
  vxlan vlan 10 vni 1010
  vxlan vlan 11 vni 1011
  vxlan vlan 12 vni 1012
  vxlan vlan 13 vni 1013
  vxlan vlan 20 vni 1020
  vxlan vlan 210 vni 1210
  vxlan vlan 211 vni 1211
  vxlan vlan 212 vni 1212
  vxlan vlan 213 vni 1213
  vxlan vlan 220 vni 1220
  vxlan vrf tenant-a vni 1000
```
Leaf-21 VXLAN Interface Configuration

```
! interface Loopback1
  ip address 2.2.2.2/32
!
interface Vxlan1
  vxlan source-interface Loopback1
  vxlan udp-port 4789
  vxlan vlan 10 vni 1010
  vxlan vlan 11 vni 1011
  vxlan vlan 12 vni 1012
  vxlan vlan 13 vni 1013
  vxlan vlan 21 vni 1021
  vxlan vlan 210 vni 1210
  vxlan vlan 211 vni 1211
  vxlan vlan 212 vni 1212
  vxlan vlan 213 vni 1213
  vxlan vlan 221 vni 1221
  vxlan vrf tenant-a vni 1000
  vxlan vrf tenant-b vni 1001
```

Note: This configuration uses VXLAN routing. For single-chip T2 and TH platforms, recirculation must be enabled. For R-Series platforms, the following configuration commands must be added:

```
hardware tcam
system profile vxlan-routing
```

Refer to diagrams for VLAN and SVI assignment to tenant; Leaf-11 also has peering out to the border router in addition to the connected SVIs.

17.11.2.5 eBGP Underlay Configuration on the Leaf Switches

The leaf switches for the underlay network peer with each spine on the physical interface. For EVPN route advertisement, the BGP EVPN session is between loopback addresses.

In this case, the underlay is all eBGP, and peering is on the physical interfaces. The MLAG leaves also peer with each other in the underlay to retain BGP EVPN connectivity (loopback reachability) in the very unlikely case that all spine links are down. This is a failover configuration that can be implemented if there is ever the chance a leaf could be "core isolated." The configuration can be viewed on each leaf using the command `show running-configuration section bgp`.

The examples below show the underlay configuration on all four leaf switches, and also on two of the spine switches as an example of the underlay configuration on the spine.

The configuration uses the following peer groups:

- **SPINE**: configuration inherited for underlay (eBGP) peering to the spines
- **SPINE_EVPN**: overlay eBGP peering between spine and leaf, using loopbacks
Figure 115: Physical Underlay Topology

```
The MAC VRFs and IP VRF for the tenants' subnets are created in the BGP router context with unique Route-Distinguishers (RD) and Route-Targets (RT) attached to each MAC-VRF and IP-VRF. The RDs provide support for overlapping MAC and IP addresses across tenants, while the RTs allow control of the routes imported and exported between MAC VRFs.

To ensure all routes are correctly imported between VTEPs sharing the same Layer-2 domain, the import and export RTs are equal across the two MLAG domains. The \texttt{redistribute learned} statement under each MAC VRF ensures any locally learned MACs in the VLAN are automatically announced as type-2 routes.

The IP VRF (Tenant-A) is created on all leaf switches which have subnets attached to the tenant's VRF with the same route target ensuring that routes are correctly imported and exported between VTEPs in the VRF. On Leaf-21 and Leaf-22, to import the external routes an eBGP session with the BGP peering router is created under the IP VRF (Tenant-A) context, and a peering from each to the other is created on the overlay.

\begin{itemize}
  \item Note: All MAC VRFs are unique, and each has its own RT, matched by the other leaves in the DC. The "tenants" as such are defined at layer 3 by assigning SVIs to the appropriate VRF. To view this assignment, use the \texttt{show ip route vrf <tenant> connected} command. Note below that VLANs 12-13 and 212-213 (shown in bold) are configured as a bundle-aware EVPN service. Also note the peering from Leaf-11 to the BGP border router in each tenant VRF.
\end{itemize}

```
17.11.2.9 Symmetric IRB Configuration (Tenant-A)

In symmetric IRB, the host routes are generated by advertising type-2 routes with both the MAC VRF VNI and the routing (or VRF) VNI. On Leaf-11, the MAC VRFs for Tenant-A are left in their default configuration (i.e., redistributing host routes). The example below shows the configuration for the MAC VRF.

MAC VRF Configuration for Tenant-A: Leaf-11

The `redistribute learned` commands below cause type-2 routes to be advertised with two labels: in VLAN 10, 1010 and 1000; in VLAN 11, 1011 and 1000; in VLAN 21, 1021 and 1000.

```
vlan 10
  rd 1.1.1.11:1010
  route-target both 1010:1010
  redistribute learned
!
vlan 11
  rd 1.1.1.11:1011
  route-target both 1011:1011
  redistribute learned
!
vlan 21
  rd 1.1.1.11:1021
  route-target both 1021:1021
  redistribute learned
!
```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with two labels. For example, on switches Leaf-21 and Leaf-22, any MAC-IP binding locally learned on subnets 10.10.10.0/24, 10.10.11.0/24, or 10.10.21.0/24 will be advertised as type-2 routes with two labels (the MAC VRF of 1010,1011, or 1021 and the IP VRF of 1000) and two route targets equal to the relevant MAC VRF for the host and IP VRF for the tenant (1000:1000). The remote leaf switches (Leaf-11 and Leaf-12), will now learn the host route in the IP VRF.

In addition to advertising the type-2 routes with dual labels, the switch will still advertise type-5 routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned. With both a layer-2 route and layer-3 host route for Server-3 learned on the MAC VRF(1010) and the IP VRF (1000) on Leaf-11, traffic ingressing on Leaf-11 from the local subnet 10.10.10.3 (i.e., VLAN 10) will be VXLAN bridged based on the MAC VRF entry. Traffic ingressing from outside the subnet (i.e., VLAN 11,12,13, or 20) will be routed to the host via the IP VRF host route.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

The type-5 routes are advertised with the IP VRF Route Distinguisher and the VNI label, signifying that the forwarding path for the prefix would be the IP VRF. The imported routes from the eBGP peering with the BGP border router in Leaf-11 and Leaf-12 are imported by both switches respectively and redistributed via type-5 advertisements to Leaf-21 and Leaf-22.

17.11.2.10 Asymmetric IRB Configuration (Tenant-B)

In asymmetric IRB, the host routes are generated by advertising type-2 routes with just the MAC VRF VNI. On leaf 11, the MAC VRFs for Tenant-B are configured with no redistribute host route within the MAC VRF configuration. The example below shows the configuration for the MAC VRF.
MAC VRF Configuration for Tenant-B: Leaf-11

The `no redistribute host-route` commands below cause type-2 routes to be advertised with a single label: in VLAN 210, 1110; in VLAN 211, 1211; in VLAN 220, 1220; and in the VLAN-aware bundle (Tenant-B-VLAN-212-213), 1212 and 1213.

```text
vlan 210
    rd 1.1.1.11:1210
    route-target both 1210:1210
    redistribute learned
    no redistribute host-route
! vlan 211
    rd 1.1.1.11:1211
    route-target both 1211:1211
    redistribute learned
    no redistribute host-route
! vlan 220
    rd 1.1.1.11:1220
    route-target both 1220:1220
    redistribute learned
    no redistribute host-route
! vlan-aware-bundle Tenant-B-VLAN-212-213
    rd 1.1.1.11:21213
    route-target both 212:213
    redistribute learned
    no redistribute host-route
    vlan 212-213
!```

With this configuration, any locally learned MAC-IP binding on a leaf switch will be advertised as a type-2 route with a single label. For example, on Leaf-11 and Leaf-12, any MAC-IP binding locally learned on subnets 10.10.10.0/24, 10.10.11.0/24, or 10.10.21.0/24 will be advertised as type-2 routes with a single label, the MAC VRF (1210,1211,1220,1212,1213 or 21111). The IP VRF (1001) still advertises the type-5 prefix routes. This ensures connectivity to the remote subnet even when no host on the subnet has been learned.

The VLAN-aware bundle VLAN type-2 routes are advertised with the VNI ID within the update.

17.11.3 EVVPN MPLS Sample Configuration

This section describes configuring and verifying BGP VPN which has steps similar to the EVPN VXLAN demonstration. Here, we examine BGP EVVPN layer 3 VPN over LDP, Segment Routing (ISIS-SR), and BGP-SR transport LSPs. This highlights the difference between the transport and the VPN overlay service.

17.11.3.1 Layer 3 VPN Over ISIS-SR

The following figures illustrate the overview of combined control and data planes.
Ethernet VPN (EVPN)

Figure 116: Control Plane Tenant-A Over ISIS-SR

Figure 117: Control Plane Tenant-B over ISIS-SR

Figure 118: Control Plane & Forwarding Tenant-a Over ISIS-SR
The North Edge router has an eBGP peering session out to leaf-11 and leaf-12 in DC1, while the South Edge router has peerings to leaf-11 and leaf-12 in DC2. Tenant-a has few additional local interfaces used for testing.

Example

The `show ip route vrf tenant-a connected` command displays the interfaces assigned to the tenant-a of North Edge router.

```
north-edge# show ip route vrf tenant-a connected
VRF: tenant-a
Codes: C - connected, S - static, K - kernel,
      O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
      N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP,
      R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
      NG - Nexthop Group Static Route, V - VXLAN Control Service,
      DH - DHCP client installed default route, M - Martian,
      DP - Dynamic Policy Route
C      192.168.168.8/30 is directly connected, Ethernet6/3.1
C      192.168.168.12/30 is directly connected, Ethernet6/2.1
```

Activating EVPN

In all scenarios, the EVPN must be activated under BGP and neighbors configured to exchange Layer 2 VPN/EVPN NLRI. The tenant’s VRF (tenant-a and tenant-b) is associated with a dynamically assigned label by BGP.

An activated EVPN provides the following functionalities:

- Enables the multi-agent routing protocol model, which is required for EVPN support.
- Sets the local autonomous system number to 64512 and configures iBGP neighbors that are activated for the Layer 2 VPN/EVPN address family.
- Sets the EVPN encapsulation type to MPLS.
- Specifies that Loopback0 will be used as the next-hop for all advertised EVPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

Example

The `service routing protocols model multi-agent` command activates EVPN on the north edge router.

```
service routing protocols model multi-agent
router bgp 64512
    router-id 1.1.1.111
    maximum-paths 128 ecmp 128
    neighbor 2.2.2.222 remote-as 64512
    neighbor 2.2.2.222 update-source Loopback0
    neighbor 2.2.2.222 fall-over bfd
    neighbor 2.2.2.222 send-community extended

    address-family evpn
        neighbor default encapsulation mpls next-hop-self source-interface Loopback0
        neighbor default graceful-restart
        neighbor 2.2.2.222 activate
```
Layer 3 Overlay Configuration

Distribution of layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, IP routing must be enabled in the VRF.

The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise EVPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRF’s IPv4 table into EVPN consists of both the RD and the original IP prefix.

The Route-Target (RT) extended communities for the VRF. TheRTs are associated with all routes exported from the VRF. Received EVPN type-5 routes carrying at least one RT matching the VRFs configuration are imported into the VRF. The route target directives are configured under the IPv4 or IPv6 address- family.

Example

The `vrf tenant-a` and `vrf tenant-a` commands define overlay VRFs (tenant-a and tenant-b) on the VTEP of North Edge router and enables IPv4 routing within them.

```
vrf tenant-a
    rd 1.1.1.1:64512
    route-target import evpn 64512:11
    route-target export evpn 64512:11
    router-id 1.1.1.111
    neighbor 192.168.168.10 remote-as 65002
    neighbor 192.168.168.10 local-as 64512 no-prepend replace-as
    neighbor 192.168.168.10 default-originate
    neighbor 192.168.168.10 maximum-routes 12000
    neighbor 192.168.168.14 remote-as 65002
    neighbor 192.168.168.14 local-as 64512 no-prepend replace-as
    neighbor 192.168.168.14 default-originate
    neighbor 192.168.168.14 maximum-routes 12000
    redistribute connected
    redistribute static

vrf tenant-b
    rd 1.1.1.1:64513
    route-target import evpn 64513:11
    route-target export evpn 64513:11
    router-id 1.1.1.111
    neighbor 192.168.168.20 remote-as 65002
    neighbor 192.168.168.20 local-as 64513 no-prepend replace-as
    neighbor 192.168.168.20 maximum-routes 12000
    neighbor 192.168.168.22 remote-as 65002
    neighbor 192.168.168.22 local-as 64513 no-prepend replace-as
    neighbor 192.168.168.22 maximum-routes 12000
    redistribute connected
    redistribute static

```

Verifying BGP EVPN Layer 3 VPN

Show commands are executed in the North Edge router to view routes to the South Edge router. Execute the same commands in the South Edge router to view vice-versa routes.
Examples

- The `show bgp evpn summary` command displays the status of EVPN peers in North Edge router.

```
north-edge#show bgp evpn summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
Neighbor         V  AS           MsgRcvd   MsgSent  InQ OutQ  Up/Down State  PfxRcd PfxAcc
PfxRcd PfxAcc
2.2.2.222        4  64512            195       127    0    0 01:13:31 Estab  78     78
```

- The `show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6` command displays all BGP EVPN ip prefix routes received from the South Edge router (6.6.6.6). Not all are advertised via the RR 2.2.2.222.

**Note:**

Each entry in the table represents a BGP path. The path specific information includes Route-Distinguisher and IP prefix. Paths are either received from EVPN peers or exported from local VRFs.

```
north-edge#show bgp evpn route-type ip-prefix ipv4 next-hop 6.6.6.6
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP
  S - Stale, c - Contributing to ECMP, b - backup
  % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link

B I 223.255.254.248/30 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6, label 953372 via 192.168.58.12, Ethernet1/1, label 408006 via 192.168.59.12, Ethernet2/1, label 408006
B I 223.255.254.252/30 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6, label 953372 via 192.168.58.12, Ethernet1/1, label 408006 via 192.168.59.12, Ethernet2/1, label 408006
```

Note: If we look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, whilst the transport label for NH 6.6.6.6 is the same. The only difference seen in tenant-b, aside from the different VPN label, is that there are no host-routes in tenant-b because within each DC tenant-b is running in asymmetric mode, therefore no host routes are generated/installed in the IP VRF.
17.11.3.2 Layer 3 EVPN Over LDP

The following figures illustrate an overview of the combined control and data planes.

Figure 119: Control Plane Tenant-A Over LDP

Figure 120: Control Plane Tenant-B over LDP
To switch to using the MPLS LDP transport, we simply need to change the next-hop advertised for EVPN routes. As illustrated above, the next hop needs to be set to loopback 200 to use the LDP LSP.

This is simply achieved by configuring the next-hop for EVPN routes on both North Edge and South Edge routes. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.200 for tenant-a and tenant-b.

```
router bgp 64512
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback200
```

Once this is configured, we can check the BGP updates and the routes in the VRF.

```
north-edge#show bgp evpn route-type ip-prefix 100.10.11.0/24 detail
BGP routing table information for VRF default

      Extended Community: Route-Target-AS:64513:11 TunnelEncap:tunnelTypeMpls
      MPLS label: 953372
```

![Figure 121: Control Plane & Forwarding Tenant-a Over LDP](image)

Note: Again, we have the same route in tenant-a and tenant-b in DC2. Hence, the two other routes with RD 6.6.6.6:64513 and RT 64513:11. The VPN label has not changed, reinforcing the fact that the BGP VPN label is orthogonal to the transport label.

Finally, let us look at the routes in the VRF tenant-a.

```
north-edge#show ip route vrf tenant-a
VRF: tenant-a
```

VRF: tenant-a
Codes: C - connected, S - static, K - kernel, 
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, 
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, 
N2 - OSPF NSSA external type 2, B I - iBGP, B E - eBGP, 
R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2, 
O3 - OSPFV3, A B - BGP Aggregate, A O - OSPF Summary, 
NG - Nexthop Group Static Route, V - VXLAN Control Service, 
DH - DHCP client installed default route, M - Martian, 
DP - Dynamic Policy Route

Gateway of last resort:
B I 0.0.0.0/0 [200/0] via 192.168.58.12, Ethernet1/1, label 904097
via 192.168.59.12, Ethernet2/1, label 904098
B E 10.10.10.103/32 [200/0] via 192.168.168.14, Ethernet6/2.1
via 192.168.168.10, Ethernet6/3.1
B E 10.10.10.104/32 [200/0] via 192.168.168.14, Ethernet6/2.1
via 192.168.168.10, Ethernet6/3.1
B I 100.10.103/32 [200/0] via 192.168.58.12, Ethernet1/1, label 904097
via 192.168.59.12, Ethernet2/1, label 904098
B I 192.168.168.4/30 [200/0] via 192.168.58.12, Ethernet1/1, label 904097
via 192.168.59.12, Ethernet2/1, label 904098
via 192.168.168.10, Ethernet6/3.1
via 192.168.168.10, Ethernet6/3.1

Note: As can be seen from the highlighted route above the label stack, the route has the same VPN route 958810, but the transport labels are now 904097 and 904098 on top (this is the ECMP label path to reach NH 6.6.6.200).

As a comparison, let us look at the routes for tenant-b.

north-edge#show ip route vrf tenant-b

VRF: tenant-b
Codes: C - connected, S - static, K - kernel, 
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,

via 192.168.168.20, Ethernet6/3.2
B I 100.10.10.0/24 [200/0] via 192.168.58.12, Ethernet1/1, label 904097
via 192.168.59.12, Ethernet2/1, label 904098
B I 192.168.168.18/31 [200/0] via 192.168.58.12, Ethernet1/1, label 904097
via 192.168.59.12, Ethernet2/1, label 904098
C 192.168.168.20/31 is directly connected, Ethernet6/3.2
17.11.3.3 Layer 3 EVPN Over BGP-SR

The following figures illustrate an overview of the combined control and data planes.

Figure 122: Control Plane Tenant-a Over BGP-SR

Figure 123: Control Plane Tenant-b Over BGP-SR
To switch to using the MPLS BGP-SR transport, we simply need to change the next-hop advertised for the EVPN routes. As shown in Control Plane Tenant-b Over BGP-SR, the next hop needs to be set to loopback 1 for using the BGP-SR LSP. This is achieved by configuring the next-hop for the EVPN routes.

```
router bgp 64512
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback1
```

Once the next-hop for the EVPN routes are configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.66 for tenant-a and tenant-b.

```
North Edge.17:52:30# show bgp evpn route-type ip-prefix 100.10.11.0/24 detail

```
**Ethernet VPN (EVPN)**

<table>
<thead>
<tr>
<th>label</th>
<th>200066</th>
</tr>
</thead>
</table>

As can be seen from the highlighted route above the label stack, the route are the transport labels 958810 and 200066 on top (this is the ECMP label path to reach NH 6.6.6.66), with the tenant-a VPN label 958810 next in the stack, identifying the route as belonging to tenant-a.

As a comparison, let us look at the routes for tenant-b. As seen in the output, the VPN label assigned to tenant-b is 953372.

<table>
<thead>
<tr>
<th>label</th>
<th>953372</th>
</tr>
</thead>
</table>

If we now look at the routes in the VRF for tenant-b, we see that the VPN label has now changed, while the transport label (for NH 6.6.6.66 is the same). The only difference seen in tenant-b, aside from the different VPN label, is that there are no host-routes in tenant-b because within each DC tenant-b is running in asymmetric mode; therefore, no host routes are generated/installed in the IP VRF.

<table>
<thead>
<tr>
<th>label</th>
<th>953372</th>
</tr>
</thead>
<tbody>

### 17.11.4 EVPN VxLAN IPv6 Overlay

The EVPN VXLAN L3 Gateway using EVPN IRB supports routing traffic from one IPv6 host to another IPv6 host on a stretched VXLAN VLAN on platforms that support ND Proxy and ND suppression. The `ipv6 address virtual` command enables the use of one MAC address for all SVI instead of one per SVI. Both EVPN IRB and VXLAN tunnel interface are required for the feature to work. The VXLAN must be configured with a VNI or the VRF for the VLAN must be configured with a VRF/VNI mapping.

#### Configuring for Overlay

The following configures the switches for global IPv6 unicast routing and IPv6 unicast routing for each VRF.

```
Switch(config)# ipv6 unicast-routing
Switch(config)# ipv6 unicast-routing vrf tenant-c
```

The following configures the switches with a virtual MAC address, which is used for mapping all virtual router IP addresses. For VARP configs, the address is receive-only; the switch never sends packets with this address as the source. For `ip address virtual`, the address is also used as the source for ARP packets.

```
Switch(config)# ipv6 virtual-router mac-address <mac>
```
The following shows the switch with IPv6 configured where one SVI uses one physical IP address.

Switch# sh run int vlan 501
interface Vlan501
    vrf forwarding tenant-c
    ipv6 enable
    ipv6 address 2004:220::1:2/112
    ipv6 virtual-router address 2004:220::1:10

The following shows configuration for the switch such that all SVI use the virtual MAC address and only one physical IP address.

Switch# sh run int vlan 501
interface Vlan501
    vrf forwarding tenant-c
    ipv6 enable
    ipv6 address virtual 2004:220::1:10/112

Limitations

Any topology that requires a VXLAN Virtual VTEP address configuration is not supported.

Example Configurations

VRF-TO-VNI MAP and VLAN-TO-VNI MAP

Under Vxlan1 interface:

Switch(config)#
interface vxlan1
    vxlan vrf tenant-c vni 4001
    vxlan vlan 501 vni 10501

MAC-VRF

Under BGP router configuration mode:

Switch(config)#
Router bgp 65000
vlan 501
    rd 20.1.1.1:10501
    route-target both 1:10501
    redistribute learned

IPv6 VRF BGP

Switch(config)#
router bgp 65000
vrf tenant-c
    rd 2.0.0.1:4001
    router-target import evpn 4001:4001
    router-target export evpn 4001:4001

! configure IPv4 router ID under the BGP VRF configuration
! for activating V6-only VRF
! router-id 4.0.0.1

The selective installation configuration is the same for ARP and IPv6 ND.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#arp ?
proxy  Proxy ARP
selective-install  Install ARP entries for remote hosts on demand
Switch(config-rtr-l2-vpn)#arp selective-install

The following disables the ND proxy reply to an NS for the specified target IPv6 address(es).

Switch(config)#
ipv6 prefix-list list-test
seq 10 deny 2000:0:0:69::19/64
! do not perform ND proxy on 2000:0:0:69::19/64

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#nd proxy prefix-list list-test

The following restores the proxy behavior.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#no nd proxy prefix-list list-test

The following disables router solicitation packets sent by a host from getting flooded to all VTEPs.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#nd rs flooding disabled

The following restores the default behavior.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#no nd rs flooding disabled

The following disables duplicate-address-detection (DAD) multicast packets from getting flooded to all VTEPs when there is no matching IP to MAC binding found in EVPN published IP to MAC bindings. When there is a match found, a DAD frame is flooded to all VTEPs (instead of doing a proxy reply) to confirm that host liveliness.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#nd dad flooding disabled

The following restores the default behavior.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#no nd dad flooding disabled

The following disables Neighbor Advertisement (NA) multicast packets from the SVI configured as a virtual router from getting flooded to all VTEPs.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#virtual-router neighbor advertisement flooding disabled

The following restores the default behavior.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#no virtual-router neighbor advertisement flooding disabled

The following disables Gratuitous ARP multicast packets from the SVI configured as a virtual router from getting flooded to all VTEPs.

Switch(config)# router 12-vpn
Switch(config-rtr-12-vpn)#virtual-router arp advertisement flooding disabled

The following restores the default behavior.

Switch(config)# router l2-vpn
Switch(config-rtr-l2-vpn)#no virtual-router arp advertisement flooding disabled

Checking the Status of the Switches

IPv6 Local Host

The following displays the ND bindings for a given VRF. The output shows that the local host "002c.0100.0001" has an IPv6 link local address "fe80::22c:1ff:fe00:1" and a global IPv6 address "2004:220::1:50". The host is connected to the MLAG port-channel 20.

Switch# show ipv6 neighbors vrf tenant-c vlan 501 | i 002c.0100.0001
2004:220::1:50          N/A 002c.0100.0001   REACH Vl501, Port-Channel20
fe80::22c:1ff:fe00:1    N/A 002c.0100.0001   REACH Vl501, Port-Channel20

EVPN IRB redistributes all the local hosts in VLAN 501. The MAC address of the host is advertised as EVPN Type 2 MAC-only route advertisement. The global IPv6 to MAC binding is advertised using MAC-IP route.

Note: By default, the IPv6 link local binding is not advertised by EVPN.

The following displays the two MAC-only routes and two MAC-IP routes. In both cases, one route is locally originated and the second one advertised by the MLAG peer with the same VTEP IP "10.0.0.1".

Switch# show bgp evpn route-type mac-ip 002c.0100.0001
BGP routing table information for VRF default
Router identifier 1.0.1.1, local AS number 65000
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop
Weight Path
Network Next Hop Metric LocPref
RD: 20.1.1.1:10501 mac-ip 002c.0100.0001
  10.0.0.1 0
  2004:220::1:50
  10.0.0.1 0
  2004:220::1:50 0
65002 65003 i

IPv6 Link Local Redistribution
The following configures link-local redistribution command under BGP router MAC-VRF configuration mode to redistribute IPv6 link local binding.

```
vlan 501
rd 20.1.1.1:10501
route-target both 1:10501
redistribute learned
redistribute link-local ipv6
```

When this is configured, NS from a local host for a link local target will get proxy-replied by the ingress VTEP if the binding is published to EVPN by a remote VTEP. The NS in that case will not get replicated to other VTEPs.

IPv6 Remote Host

The following displays the MAC-only and MAC-IP routes for remote host “002d.0100.0001”. These two routes originated from VTEP 10.0.0.2.

```
Switch# show bgp evpn route-type mac-ip 002d.0100.0001 detail
BGP routing table information for VRF default
Router identifier 1.0.1.1, local AS number 65000
BGP routing table entry for mac-ip 002d.0100.0001, Route Distinguisher: 20.1.1.3:10501
Paths: 1 available
65002 65004

17.11.5 IP VPNs Sample Configuration

Here, we examine BGP EVPN layer 3 VPN over an LDP, ISIS-SR, and BGP-SR transport LSPs. This highlights the separation between the transport and the VPN overlay service.

The following figures illustrate the sample VPN Physical Topology.

![IPv4 VPN Physical Topology](image-url)

**Figure 125: IPv4 VPN Physical Topology**
Figure 126: IPv6 VPN Physical Topology

17.11.5.1 IP VPN over ISIS-SR

The figure below illustrates an overview of the combined control and data planes.
The next two figures illustrate the forwarding path and control plane for both IP traffic over ISIS MPLS segment routing.
Both North Edge and South Edge routers have an eBGP peering session out to the CE; and learning routes from CE and remote PE.

- The `show ip route vrf tenant-d` command displays IPv4 Routes in the VRF of North Edge.

```
north-edge#show ip route vrf tenant-d
VRF: tenant-d
Codes: C - connected, S - static, K - kernel,
       O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       * - hidden, . - unreachables
```

Figure 128: IPv4 VPN Forwarding Over ISIS-SR MPLS

Figure 129: IPv6 VPN Forwarding Over ISIS-SR MPLS

View IPv4 and IPv6 Routes in the VRF

    via 2010::2, Ethernet6/1.620
```

**Activating IP VPN**

In all scenarios, the IP VPN must be activated under BGP and neighbors configured to exchange the IP VPN NLRIs. The tenant's VRF (tenant-d) is associated with a dynamically assigned label by BGP.

**North Edge**

```bash
service routing protocols model multi-agent
router bgp 64512
    router-id 1.1.1.111
    maximum-paths 128 ecmp 128
    neighbor 2.2.2.222 remote-as 64512
    neighbor 2.2.2.222 update-source Loopback0
    neighbor 2.2.2.222 fall-over bfd
    neighbor 2.2.2.222 send-community extended
    neighbor 2.2.2.222 maximum-routes 12000
    address-family vpn-ipv4
        neighbor 2.2.2.222 activate
        neighbor default encapsulation mpls next-hop-self source-interface Loopback0
    address-family vpn-ipv6
        neighbor 2.2.2.222 activate
        neighbor default encapsulation mpls next-hop-self source-interface Loopback0
```

South Edge

service routing protocols model multi-agent

router bgp 64512
  router-id 6.6.6.6
  maximum-paths 128 ecmp 128
  neighbor 2.2.2.222 remote-as 64512
  neighbor 2.2.2.222 update-source Loopback0
  neighbor 2.2.2.222 fall-over bfd
  neighbor 2.2.2.222 send-community extended
  neighbor 2.2.2.222 maximum-routes 12000

  address-family vpn-ipv4
    neighbor 2.2.2.222 activate
    neighbor default encapsulation mpls next-hop-self source-interface Loopback0

  address-family vpn-ipv6
    neighbor 2.2.2.222 activate
    neighbor default encapsulation mpls next-hop-self source-interface Loopback0

The configuration above provides the following:

- It enables the multi-agent routing protocol model, which is required for BGP VPN support.
- It sets the local autonomous system number to 64512 and configured the route-reflector for both IPv4 VPN and IPv6 VPN capabilities.
- It sets the IP VPN encapsulation type to MPLS (default).
- It specifies that Loopback0 will be used as the next-hop for all advertised VPN routes. The underlay configuration must provide MPLS LSPs from remote PEs to this loopback interface address.

Layer 3 Overlay Configuration

Distribution of Layer 3 routes over BGP is enabled by configuring one or more IP VRFs under the router bgp configuration mode. Additionally, either IPv4 or IPv6 routing must be enabled in the VRF.

- Configure IP VRF in the North Edge router.

  vrf instance tenant-d
  ip routing vrf tenant-d
  ipv6 unicast-routing vrf tenant-d

  router bgp 64512
  vrf tenant-d
    rd 1.1.1.1:64514
    route-target import vpn-ipv4 64512:4364
    route-target import vpn-ipv6 64512:4364
    route-target export vpn-ipv4 64512:4364
    route-target export vpn-ipv6 64512:4364
    neighbor 10.255.255.6 remote-as 65011
    neighbor 10.255.255.6 maximum-routes 12000
    neighbor 2010::6 remote-as 65011
    neighbor 2010::6 maximum-routes 12000

    address-family ipv6
      neighbor 2010::6 activate
      redistribute connected

• Configure IP VRF in the South Edge router.

vrf instance tenant-d
ip routing vrf tenant-d
ipv6 unicast-routing vrf tenant-d
!
router bgp 64512
  vrf tenant-d
    rd 6.6.6.6:64514
    route-target import vpn-ipv4 64512:4364
    route-target import vpn-ipv6 64512:4364
    route-target export vpn-ipv4 64512:4364
    route-target export vpn-ipv6 64512:4364
    neighbor 10.255.255.2 remote-as 65010
    neighbor 10.255.255.2 maximum-routes 12000
    neighbor 2010::2 remote-as 65010
    neighbor 2010::2 maximum-routes 12000
    !
    address-family ipv6
      neighbor 2010::2 activate
      redistribute connected
   !

These IP VRF configurations provide the following functionalities:

• It defines overlay VRFs (tenant-d) on the PE and enables IP unicast routing.
• The VRF is assigned a unique Route-Distinguisher (RD). The RD allows the PE to advertise VPN routes for the same IP prefix that have been exported by different VRFs. The NLRI RouteKey of a route exported from the VRFs IPv4 table into VPN consists of both the RD and the original IP prefix.
• The Route-Target (RT) extended communities for the VRF. The RTs are associated with all routes exported from the VRF. Received VPN routes carrying at least one RT matching the VRFs configuration are imported into the VRF.

Verifying IP VPNs over ISIS-SR

• The `show bgp vpn-ipv4 summary` command displays the status of the VPN IP peers in the North Edge router with the BGP VPN enabled.

```
north-edge#show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 1.1.1.111, local AS number 64512
Neighbor Status Codes: m - Under maintenance
          Neighbor  V  AS  MsgRcvd  MsgSent  InQ  OutQ  Up/Down  PfxRcd  PfxAcc
            State
            2.2.2.222  4  64512  172   45   0   0 00:17:16
            Estab  2   2
```

• The `show bgp vpn-ipv4` command displays routes sent and received through IP VPN.

```
north-edge#show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
```

3097
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>
<thead>
<tr>
<th>Network</th>
<th>Next Hop</th>
<th>Metric</th>
<th>LocPref</th>
<th>Weight</th>
</tr>
</thead>
</table>
| * > RD: 6.6.6.6:64514 IPv4 prefix 10.255.255.0/30
  6.6.6.6          -       100     0 |
| 65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222 |
| * > RD: 1.1.1.1:64514 IPv4 prefix 10.255.255.4/30
  -                -       100     0 |
| 65011 i |
| * > RD: 1.1.1.1:64514 IPv4 prefix 201.0.0.0/24
  -                -       100     0 |
| 65011 i |
| * > RD: 6.6.6.6:64514 IPv4 prefix 206.0.0.0/24
  6.6.6.6          -       100     0 |
| 65010 i Or-ID: 6.6.6.6 C-LST: 2.2.2.222 |

**Note:** Each entry in the table represents a BGP path. The path specific information includes the Route-Distinguisher and the IP prefix. Paths are either received from VPN peers or exported from local VRFs.

- The `show bgp vpn-ipv4 206.0.0.0/24 detail` and `show bgp vpn-ipv6 2206::/64 detail` commands display detailed view of the IP prefix route for 206.0.0.0/24 and 2206::/64 of the North Edge router.
65010
6.6.6.6 from 2.2.2.222 (2.2.2.222)
  Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
  Extended Community: Route-Target-AS:64512:4364
  MPLS label: 967920

north-edge#show bgp vpn-ipv6 2206::/64 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv6 prefix 2206::/64, Route Distinguisher:
  6.6.6.6:64514
Paths: 1 available
  65010
6.6.6.6 from 2.2.2.222 (2.2.2.222)
  Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
  Extended Community: Route-Target-AS:64512:4364
  MPLS label: 965242

Note: The output includes the RD and IP prefix identifying the route. As seen in the output, the IPv4 VPN route is received from 2.2.2.222 because it is set-up to be a route-reflector, but the next hop is 6.6.6.6. Both are advertised with tenant VPN label 967920 and 965242 and an RT.

- The `show ip bgp vrf tenant-d` command displays the BGP table for the VRF containing the imported EVPN routes.

north-edge#show ip bgp vrf tenant-d
BGP routing table information for VRF tenant-d
Router identifier 1.1.1.1, local AS number 64512
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

</tbody>
</table>

Note: Each entry in the table represent a BGP path that is either locally redistributed and received into the VRF or imported from the IPv4 VPN table. VPN routes are received from router 2.2.2.222 C-List (cluster list - basically identifying this route as from a route-reflector) with originating router being 6.6.6.6.

Finally, let us look at the routes in the VRF tenant-d.

VRF: tenant-d
Codes: C - connected, S - static, K - kernel,
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1,
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP,
R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2,
O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary,
NG - Nexthop Group Static Route, V - VXLAN Control Service,
DH - DHCP client installed default route, M - Martian,
DP - Dynamic Policy Route

Gateway of last resort is not set

B I    10.255.255.0/30 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6,
label 967920 via 192.168.58.12, Ethernet1/1, label 408006

C      10.255.255.4/30 is directly connected, Ethernet6/1.120

B E    201.0.0.0/24 [200/0] via 10.255.255.6, Ethernet6/1.120
B I    206.0.0.0/24 [200/0] via 6.6.6.6/32, IS-IS SR tunnel index 6,
label 967920 via 192.168.58.12, Ethernet1/1, label 408006

Note: As displayed in the highlighted route above the label stack, the route is the transport
label 408006 on top (this is the label to reach NH 6.6.6.6), with the tenant-a VPN label 967920
next in the stack, identifying the route as belonging to tenant-d.

A check of the Tunnel FIB confirms that 408006 is the IS-IS-SR LSP.

north-edge# show mpls tunnel fib
! 'show mpls tunnel fib' has been deprecated. Please use 'show tunnel fib
(options)' moving forward.

17.11.5.2 IP VPNs Over LDP

The following figures illustrate an overview of the combined control and data planes.
To switch to using the MPLS LDP transport, we just need to change the next-hop we advertised for the VPN routes. As shown above, the next hop needs to be set to loopback 200 for using the LDP LSP. This is achieved by configuring the next-hop for the EVPN routes on both north and south edge routers.

```
router bgp 64512
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback200
```
Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. We now have the NH set to 6.6.6.200 for tenant-d.

```
north-edge# show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
Router identifier 1.1.1.111, local AS number 64512
BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route Distinguisher: 6.6.6.6:64514
  Paths: 1 available
  65010
    6.6.6.200 from 2.2.2.222 (2.2.2.222)
      Origin IGP, metric -, localpref 100, weight 0, valid, internal, best

Note: As seen from the highlighted route above the label stack, the route are the transport label 904097 on top (this is the label path to reach NH 6.6.6.200), with the tenant-d VPN label 967920 next in the stack, and identifying the route as belonging to tenant-a.

A capture of the dataplane on North-Edge matching on the LDP transport label confirms the encapsulated traffic on the wire. 904097:976920:[Source IP Address][Destination IP Address].

17.11.5.3 IP VPNs Over BGP-SR

The following figures illustrate an overview of the combined control and data planes.
Figure 133: IPv4 VPN and IPv6 VPN Over BGP-SR MPLS
To switch to using the MPLS BGP-SR transport, we just need to change the next-hop we advertised for the VPN routes. As shown above, the next hop needs to be set to loopback 1 for using the BGP-SR LSP.

This is achieved by configuring the next-hop for EVPN routes.

```bash
router bgp 64512
  address-family evpn
    neighbor default encapsulation mpls next-hop-self source-interface Loopback1
```
Once this is configured, we can check the BGP updates and the routes in the VRF. The output again includes the RD and IP prefix identifying the route. As seen in the output, we now have the NH set to 6.6.6.66 for tenant-d.

```
north-edge# show bgp vpn-ipv4 206.0.0.0/24 detail
BGP routing table information for VRF default
 Router identifier 1.1.1.111, local AS number 64512
 BGP routing table entry for IPv4 prefix 206.0.0.0/24, Route Distinguisher: 6.6.6.6:64514
 Path: 1 available
  65010
  6.6.6.66 from 2.2.2.222 (2.2.2.222)
   Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
   Extended Community: Route-Target-AS:64512:4364
   MPLS label: 967920
```

```
north-edge# show bgp vpn-ipv6 2206::/64 detail

17.12 EVPN and VCS Commands

Router BGP Configuration Mode
- next-hop resolution disabled
- redistribute service vxlan
- router general
- route-target
- route-target export
- route-target import
- route-target route-map
- vlan (VLAN-AWARE-Bundle configuration mode)
- vni-aware-bundle

VCS Commands
- redistribute bgp evpn vxlan

Display Commands
- show bgp evpn
- show ip bgp vrf
- show ip route vrf
- show ipv6 bgp vrf
- show ipv6 route vrf
- show l2rib input all
- show l2Rib input vxlan-control-service
- show l2rib output
- show service vxlan address-table
- show vrf leak flapping
- show vxlan control-plane
17.12.1 next-hop resolution disabled

The `next-hop resolution disabled` command disables the next-hop resolution in routes received from BGP-EVPN peers.

The `no next-hop resolution disabled` and the `default next-hop resolution disabled` commands enable the next-hop resolution in routes received from BGP-EVPN peers.

**Command Mode**

Router-BGP Address-Family Configuration

**Command Syntax**

`next-hop resolution disabled`

**Example**

This command disables the next-hop resolution in routes received from BGP-EVPN peers.

```
cvx(config)#router bgp 65002
cvx(config-router-bgp)#address-family evpn
cvx(config-router-bgp-af)#next-hop resolution disabled
cvx(config-router-bgp-af)#
```
17.12.2 redistribute bgp evpn vxlan

The `redistribute bgp evpn vxlan` command enables BGP-EVPN routes to be redistributed to VCS which in turn advertises them to all VTEPs within the DC.

The `no redistribute bgp evpn vxlan` and the `default redistribute bgp evpn vxlan` commands disable the redistribution of BGP-EVPN routes to VCS.

**Command Mode**

CVX-VXLAN Configuration

**Command Syntax**

`redistribute bgp evpn vxlan`

**Example**

This command enables redistribution of BGP-EVPN routes to VCS.

```
cvx(config)#cvx
 cvx(config-cvx)#no shutdown 
 cvx(config-cvx)#service vxlan 
 cvx(config-cvx-vxlan)#no shutdown 
 cvx(config-cvx-vxlan)#redistribute bgp evpn vxlan
```
17.12.3 redistribute service vxlan

The `redistribute service vxlan` command enables BGP to redistribute the Layer 2 bridging information received from VCS.

The `no redistribute service vxlan` and the `default redistribute service vxlan` commands disable the redistribution of the bridging information received from VCS.

Command Mode

Router-BGP VNI Configuration

Command Syntax

`redistribute service vxlan`

Example

This command enables redistribution of the Layer 2 bridging information received from VCS.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#redistribute service vxlan
```
17.12.4 router general

The `router general` command configures a route-map to leak routes from one VRF to another VRF using a route-map named “RM1”.

The `no router general` and `default router general` commands disable the router general configuration from the running-config.

**Command Mode**
Router General Configuration

**Command Syntax**
router general
no router general
default router general

d

**Examples**

- These commands configure a route-map to leak routes from “VRF1” to “VRF2” using a route-map “RM1”.

```
switch(config)#router general
switch(config-router-general)#vrf VRF2
switch(config-router-general-vrf-VRF2)#leak routes source-vrf VRF1
    subscribe-policy RM1
```

- These commands configure a route-map with the prefix 10.0.0.0/8 and the administrative distance to 10 in the destination VRF.

```
switch(config)#ip prefix-list PL1
switch(config-ip-pfx)#permit 10.0.0.0/8
switch(config)#ip route-map RM1
switch(config-route-map-RM1)#match ip address prefix-list PL1
switch(config-route-map-RM1)#set distance 10
```
17.12.5  route-target export

The route-target export command allows the user to export routes from a VRF to the local VPN table using the route target extended community list.

The no route-target export and default route-target export commands remove the routes from the VPN table.

Command Mode
Router-BGP VNI Configuration

Syntax
route-target export [evpn | vpn-ipv4 | vpn-ipv6] <RT>
no route-target export
default route-target export

Parameters
- evpn  EVPN address family.
- vpn-ipv4  MPLS L3 VPN IPv4 unicast address family.
- vpn-ipv6  MPLS L3 VPN IPv6 unicast address family.
- RT  route-target extended community.

Examples
- These commands export routes from vrf-red to the VPN table.

```
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
```

- These commands export routes from vrf-red to the EVPN table.

```
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-red
switch(config-router-bgp-vrf-vrf-red)#rd 1:1
switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
```
17.12.6  route-target import

The route-target import command allows the user to import route target extended community lists from the local VPN table to the target VRF.

The no route-target import and default route-target import commands remove the routes from the VPN table.

Command Mode
Router-BGP VNI Configuration

Syntax
route-target import  [evpn | vpn-ipv4 | vpn-ipv6] <RT>
no route-target import
default route-target import

Parameters
• evpn  EVPN address family.
• vpn-ipv4 MPLS L3 VPN IPv4 unicast address family.
• vpn-ipv6 MPLS L3 VPN IPv6 unicast address family.
• RT  route-target extended community.

Examples
• These commands import routes from the VPN table to vrf-blue.

```plaintext
switch(config)#service routing protocols model multi-agent
switch(config)#mpls ip
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
```

• These commands import routes from the EVPN table to vrf-blue.

```plaintext
switch(config)#router bgp 65001
switch(config-router-bgp)#vrf vrf-blue
switch(config-router-bgp-vrf-vrf-blue)#rd 2:2
switch(config-router-bgp-vrf-vrf-blue)#route-target import evpn 10:1
```
17.12.7  route-target route-map

The `route-target route-map` command allows the user to export and import route target extended community lists from one VRF to another using route maps.

The `no route-target route-map` and `default route-target route-map` commands remove the routes from the VPN table.

**Command Mode**
Router-BGP VNI Configuration

**Syntax**

```
route-target {import | export} [evpn | vpn-ipv4 | vpn-ipv6] route-map RM
```

```
no route-target route-map
```

```
default route-target route-map
```

**Parameters**

- `evpn`  EVPN address family.
- `vpn-ipv4`  MPLS L3 VPN IPv4 unicast address family.
- `vpn-ipv6`  MPLS L3 VPN IPv6 unicast address family.
- `RM` route-map extended community.

**Examples**

- These commands export routes from vrf-red to the VPN table.

  ```
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 10:10
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 10:20
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv4 route-map EXPORT_V4_ROUTES_T0_VPN_TABLE
  switch(config-router-bgp-vrf-vrf-red)#route-target export vpn-ipv6 route-map EXPORT_V6_ROUTES_T0_VPN_TABLE
  ```

- These commands export routes from vrf-red to the EVPN table.

  ```
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-red
  switch(config-router-bgp-vrf-vrf-red)#rd 1:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export evpn 10:1
  switch(config-router-bgp-vrf-vrf-red)#route-target export evpn route-map EXPORT_V4_ROUTES_T0_EVPN_TABLE
  ```

- These commands import routes from the VPN table to vrf-blue.

  ```
  switch(config)#service routing protocols model multi-agent
  switch(config)#mpls ip
  switch(config)#router bgp 65001
  switch(config-router-bgp)#vrf vrf-blue
  switch(config-router-bgp-vrf-vrf-blue)#rd 1:1
  switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv4 10:10
  ```
These commands import routes from the EVPN table to vrf-blue.

```bash
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6 10:20
route-map IMPORT_V4_ROUTES_VPN_TABLE
switch(config-router-bgp-vrf-vrf-blue)#route-target import vpn-ipv6
route-map IMPORT_V6_ROUTES_VPN_TABLE
```
17.12.8 route-target

The route-target command configures a well-known extended community that is used by BGP-EVPN to export routes from or import routes into MAC-VRF.

The no route-target and default route-target commands delete the route-target configuration.

Command Mode
Router-BGP VNI Configuration

Syntax
route-target {export | import | both} rt
no route-target
default route-target

Parameters
• export configures a well-known extended community that is attached to the routes exported by BGP-EVPN.
• import configures a well-known extended community that identifies the received routes that need to be imported into the MAC-VRF specified by the VNI bundle.
• both configures the same extended community for import and export of routes.
• rt route-target extended community.

Example
This command configures a well-known extended community for import and export of routes.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
cvx(config-macvrf-bundle1)#route-target both 503:12
cvx(config-macvrf-bundle1)#
```
show bgp evpn

The `show bgp evpn` command displays information about the BGP-EVPN routes of the switch.

**Command Mode**
Global Configuration

**Command Syntax**
`show bgp evpn [community | detail | esi esid | extcommunity | host-flap | instance | large-community ASN:nn:nn | next-hop | rt | admin:local-assignment | route-type | summary | vni vni_num]`

**Parameters**

- `<no parameters>` displays all routes of the switch.
- `community` displays routes filtered by the specified community. Options include:
  - `GSHUT` well known GSHUT community.
  - `aa:nn` AS and network number, separated by colon. The value ranges from 1 to 4294967295.
  - `internet` advertises route to the Internet community.
  - `local-as` advertises route only to local peers.
  - `no-advertise` does not advertise the route to any peer.
  - `no-export` advertises route only within the BGP-EVPN AS boundary
  - `comm_num` community number. Values range from 1 to 4294967040.
- `detail` displays detailed information of routes.
- `esi esid` displays routes filtered by the specified Ethernet Segment Identifier (ESI).
- `extcommunity` displays routes that match with BGP or VPN extended community list. Options include:
  - `esi-label esid` displays routes filtered by the specified value of ESI label. The value ranges from 0 to 16777215.
  - `mac-mobility` displays routes filtered by the specified MAC mobility.
  - `rt` displays routes filtered by the specified route target.
  - `tunnel-encap vxlan` displays routes filtered by the VXLAN tunnel encapsulation.
  - `router-mac H.H.H` displays routes filtered by the specified router MAC address.
- `host-flap` displays routes that contains MAC addresses that are blacklisted due to duplication.
- `instance` displays routes with EVPN instances.
- `large-community ASN:nn:nn` displays routes filtered by the specified large community.
- `next-hop` displays routes filtered by next-hop IPv4 or IPv6 addresses of remote VTEP.
- `rd admin:local-assignment` displays routes filtered by the specified Route Distinguisher (RD).
- `route-type` displays routes filtered by NLRI route type.
- `summary` displays summary of routes.
- `vni vni_num` displays routes filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to 4294967294.

**Examples**

- This command displays BGP-EVPN routes filtered by the VNI 3011.

```
cvx(config-router-bgp-af)#show bgp evpn vni 3011
Router identifier 2.0.2.2, local AS number 65002
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>
<thead>
<tr>

<th>Weight</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>3119</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```
This command displays the prefixes that are exported to the respective VPN table, along with the route distinguisher.

```
switch(config)# show bgp evpn
BGP routing table information for VRF default
Router identifier 1.1.1.1, local AS number 65001
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
S - Stale, c - Contributing to ECMP, b - backup
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

</table>
```
17.12.10  show ip bgp vrf

The `show ip bgp vrf` command displays the type of VPN from the imported route. It shows an indication that the IPv4 route has been leaked and source VRF information is displayed.

**Command Mode**
Global Configuration

**Command Syntax**

```
show ip bgp vrf {vrf_name | all | default}
```

**Parameters**

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.
- `default` default virtual routing and forwarding instance.

**Example**

This command displays the leaked and source VRF information.

```
switch(config)#show ip bgp 13.0.0.0/24 vrf vrf-blue
BGP routing table information for VRF vrf-blue
Router identifier 5.0.0.2, local AS number 65001
BGP routing table entry for 130.110.61.0/24
  4.0.0.3 from 4.0.0.3 (52.0.0.1), imported EVPN route, RD 400:1
      Origin IGP, metric -, localpref 100, weight 0, valid, external,best
      Extended Community: Route-Target-AS:4000:1 TunnelEncap:tunnelTypeVxlan
      EvpnRouterMac:74:83:ef:0b:70:f3
      Leaked from VRF vrf-red
```
17.12.11 show ip route vrf

The `show ip route vrf` command displays leaked prefixes with the label “L” in the output that indicates that the IPv4 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

**Command Mode**

Global Configuration

**Command Syntax**

```
show ip route vrf {vrf_name | all}
```

**Parameters**

- `vrf_name` name of the VRF.
- `all` displays summary of all VRFs.

**Example**

These commands display the OSPF or OSPFV3 leaked routes as “redistribute ospf” and “redistribute ospfv3” are configured on the source VRF vrf-red.

```
switch(config)#show ip route vrf vrf-blue
VRF: vrf-blue
Codes: C - connected, S - static, K - kernel, 
      0 - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, 
      E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, 
      N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP, 
      R - RIP, I L1 - IS-IS level 1, I L2 - IS-IS level 2, 
      O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary, 
      NG - Nexthop Group Static Route, V - VXLAN Control Service, 
      DH - DHCP client installed default route, M - Martian, 
      DP - Dynamic Policy Route, L - VRF Leaked
Gateway of last resort is not set
C 5.0.0.2/31 is directly connected, Ethernet14
B L 57.0.0.3/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 45.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 52.0.0.1/32 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 120.0.0.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 130.0.0.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 130.0.1.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 130.0.2.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
B L 130.0.3.0/24 [200/0] (source VRF vrf-red) via 4.0.0.3, Ethernet11
```
17.12.12  show ipv6 bgp vrf

The `show ipv6 bgp vrf` command displays the type of VPN from the imported route. It shows an indication that the IPv6 route has been leaked and source VRF information is displayed.

**Command Mode**
Global Configuration

**Command Syntax**

```
show ipv6 bgp vrf {vrf_name | all | default}
```

**Parameters**
- `vrf_name`: name of the VRF.
- `all`: displays summary of all VRFs.
- `default`: default virtual routing and forwarding instance.

**Example**
This command displays the leaked and source VRF information.

```
switch(config)#show ipv6 bgp 2001:10:1::102/64 vrf default
BGP routing table information for VRF default
Router identifier 218.218.218.218, local AS number 34
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP, S - Stale, c - Contributing to ECMP, b - backup, L - labeled-unicast
% - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes: Or-ID - Originator ID, C-LST - Cluster List, LL Nexthop - Link Local Nexthop

<table>
<thead>
<tr>
<th>Network</th>

</tr>
</tbody>
</table>
```
17.12.13  show ipv6 route vrf

The show ipv6 route vrf command displays leaked prefixes with the label “L” in the output that indicates that the IPv6 route has been leaked. It also displays information about the source VRF from which these prefixes have been leaked.

Command Mode
Global Configuration

Command Syntax
show ipv6 route vrf{vrf_name | all}

Parameters
• vrf_name  name of the VRF.
• all   displays summary of all VRFs.

Example
These commands display the OSPF or OSPFv3 leaked routes as “redistribute ospf” and “redistribute ospfv3” are configured on the source VRF vrf-red.

```
switch(config)#show ipv6 route vrf vrf-blue
VRF: vrf-blue
Displaying 802 of 802 IPv6 routing table entries
Codes: C - connected, S - static, K - kernel, O3 - OSPFv3, B - BGP, R - RIP, A B - BGP Aggregate, I L1 - IS-IS level 1, I L2 - IS-IS level 2, DH - DHCP, NG - Nexthop Group Static Route, M - Martian, DP - Dynamic Policy Route, L - VRF Leaked

```
17.12.14 show l2rib input all

Use the show l2rib input all command to display the Layer 2 RIB input tables migration process.

**Command Mode**

EXEC

**Command Syntax**

```
```

**Parameters**

- **detail** Displays a more comprehensive output.
- **floodset** Displays L2Rib floodset from input source.
  - **vlan** Filter by VLAN ID.
  - **vtep** Filter by VTEP.
- **interface** Filter by destination interface.
  - **Ethernet** Ethernet interface.
  - **Port-Channel** Link Aggregation Group (LAG).
- **mac H.H.H** Filter by MAC address.
- **vlan vlan_id** Filter by VLAN ID.
- **vtep** Filter by VTEP.
  - **A.B.C.D** IP address of VTEP.
  - **A:B:C:D:E:F:G:H** IP address of VTEP.
17.12.15  show l2Rib input vxlan-control-service

Use the show l2Rib input vxlan-control-service to display the migration processes for the VXLAN control service.

Command Mode
EXEC

Command Syntax

Parameters
- **detail** Displays a more comprehensive output.
- **floodset** Displays L2Rib floodset from input source.
  - **vlan** Filter by VLAN ID.
  - **vtep** Filter by VTEP.
- **interface** Filter by destination interface.
  - **Ethernet** Ethernet interface.
  - **Port-Channel** Link Aggregation Group (LAG).
- **mac** Filter by MAC address.
  - **H.H.H** Ethernet address.
- **vlan vlan_id** Filter by VLAN ID.
- **vtep** Filter by VTEP.
  - **A.B.C.D** IP address of VTEP.
  - **A:B:C:D:E:F:G:H** IP address of VTEP.
17.12.16 show l2rib output

Use the `show l2rib output` command to display the Layer 2 RIB output tables migration process.

**Command Mode**

EXEC

**Command Syntax**

```
```

**Parameters**

- **detail** Displays a more comprehensive output.
- **floodset** Displays L2Rib floodset from input source.
  - **vlan** Filter by VLAN ID.
  - **vtep** Filter by VTEP.
- **interface** Filter by destination interface.
  - **Ethernet** Ethernet interface.
  - **Port-Channel** Link Aggregation Group (LAG).
- **mac H.H.H** Filter by MAC address.
- **vlan vlan_id** Filter by VLAN ID.
- **vtep** Filter by VTEP.
  - **A.B.C.D** IP address of VTEP.
  - **A:B:C:D:E:F:G:H** IP address of VTEP.
17.12.17 show service vxlan address-table

The `show service vxlan address-table` command displays route entries in the MAC forwarding table that are added through the CVX.

**Command Mode**

CVX Global Configuration

**Command Syntax**

```
show service vxlan address-table {advertised | received}[address H.H.H | evpn | hsc | mss | switch [Word | all] | vni vnid | vtep A.B.C.D]
```

**Parameters**

- `advertised` displays the advertised route entries in the MAC forwarding table.
- `received` displays the received route entries in the MAC forwarding table.
- `address H.H.H` displays route entries that are filtered by the specified MAC addresses.
- `evpn` displays route entries filtered by BGP-EVPN.
- `hsc` displays route entries filtered by Hardware Switch Controller (HSC).
- `mss` displays route entries filtered by Macro Segmentation Service (MSS).
- `switch` displays route entries that are filtered by the specified switch or all switches. Options include:
  - `Word` Hostname, IP address or ID of the switch.
  - `all` all switches
- `vni vnid` displays route entries filtered by the specified VXLAN Network Identifier (VNI). Value ranges from 1 to 4294967294.
- `vtep A.B.C.D` displays route entries filtered by the specified IP address of the remote Virtual Tunnel End Point (VTEP).

**Examples**

- This command displays the route entries in MAC forwarding table advertised to BGP-EVPN peers.

```
cvx#show service vxlan address-table advertised evpn

Advertised Mac Address Table
-------------------------------
VNI          Mac Address    VTEP         Moves
----------- ----------------- --------------- ----
1000         02:01:62:01:00:00 10.0.0.1         1
Total Mac Addresses for this criterion: 1

Advertised Flood Table
-----------------------
VNI          Mac Address    VTEP(s)
----------- ----------------- --------------- ----
1000         00:00:00:00:00:00:00 10.0.0.1   10.0.0.2
Total Mac Addresses for this criterion: 1

cvx#
```

- This command displays the route entries in MAC forwarding table received from BGP-EVPN peers.

```
cvx#show service vxlan address-table received evpn

Received Mac Address Table
---------------------------
Source  VNI      Mac Address    VTEP       Moves
-------- -------- ----------------- ----------- ----

Total Mac Addresses for this criterion: 1

cvx#
```
17.12.18 show vrf leak flapping

The `show vrf leak flapping` command displays the flapping prefixes of the routes leaked from one VRF to another VRF. Routes that are detected as “flapping” are blocked considering the future leaking policy execution.

**Command Mode**
EXEC

**Command Syntax**

```
show vrf leak flapping
```

**Parameters**

- **destination** displays flapping prefixes destined to a VRF.
- **prefix** displays flapping routes for a prefix.
- **source** displays flapping prefixes sourced from a VRF.
- **vrf** displays flapping prefixes associated with a VRF

**Example**

This command displays the flapping prefixes of the leaked routes.

```
switch#show vrf leak flapping
Age  Source VRF  Destination VRF  Prefix            Created At
141   VRF1      VRF2              10.0.2.0/24    3357281.40992
```
17.12.19 show vxlan control-plane

To enable the user to quickly view which control planes and sources are importing reachability information into which VLANs, use the following show command:

Command Mode
EXEC

show vxlan control-plane [ export vlan [ $ | vlan_id ] | import vlan [ $ | vlan_id ] ] [vlan [ $ | vlan_id ]]

Parameters
- **export** Restricts output to VLANs exporting to a control plane.
  - **vlan** Specifies specific VLANs to display control plane information.
    - **$** List end.
    - **vlan_id** VLAN ID. Range 1-4094.
- **import** Restricts output to VLANs importing from a control plane.
  - **$** List end.
  - **vlan_id** VLAN ID. Range 1-4094.
- **vlan** Specifies specific VLANs to display control plane information.
  - **$** List end.
  - **vlan_id** VLAN ID. Range 1-4094.

17.12.20 vlan (VLAN-AWARE-Bundle configuration mode)

The **vlan add/ remove** command configures the VLAN range string in a VLAN-AWARE-BUNDLE. When the add and remove options are not used, the currently configured range is replaced by the new one. The add and remove options update the currently configured range-aware bundles by adding or removing the provided VLAN range from the currently configured range respectively.

Command Mode
VLAN-AWARE-BUNDLE Configuration

Command Syntax
vlan [add | remove] range

Parameters
- **range** is the range specified.

Example
These commands take an existing vlan-aware-bundle configuration, corporate_100, and modify it with the add and remove options.

(Existing configuration for corporate_100)
```plaintext
vlan-aware-bundle corporate_100
   rd 1.1.1.1:100
   route-target both 100:100
   vlan 1-10
```

switch(config-vlan-aware-bundle)#vlan add 1000

(Modified configuration for corporate_100)
```plaintext
vlan-aware-bundle corporate_100
   rd 1.1.1.1:100
   route-target both 100:100
```
vlan 1-10, 1000

switch(config-vlan-aware-bundle)#vlan remove 5

(Updated configuration for corporate_100)
vlan-aware-bundle corporate_100
  rd 1.1.1.1:100
  route-target both 100:100
  vlan 1-4, 6-10, 1000
17.12.21  vni-aware-bundle

The `vni-aware-bundle` command configures a BGP MAC-VRF containing Layer 2 routes from a group of VXLAN Network Identifiers (VNI).

**Command Mode**
Router BGP Configuration

**Command Syntax**

```
vni-aware-bundle vni_bundle_name
```

**Parameter**

`vni_bundle_name`  VNI bundle name.

**Example**

This command configures MAC-VRF BGP to support VNI bundle1.

```
cvx(config)#router bgp 100
cvx(config-router-bgp)#vni-aware-bundle bundle1
```
Multiprotocol Label Switching (MPLS)

Tunneling protocols encapsulate packets of a different protocol as the payload of a larger frame for delivery within networks utilizing the encapsulating protocol. Tunneling facilitates the delivery of payload over an incompatible delivery network and creates a secure path through an untrusted network. Protocols that this chapter describes include MPLS, Decap Groups, and Nexthop Groups.

Sections in this chapter include:

- MPLS
- BGP/MPLS L3 VPN
- RSVP-TE LSR
- LDP Pseudowire
- MPLS Commands

18.1  MPLS

These sections describe the Arista MPLS implementation:

- MPLS Description
- MPLS Configuration

18.1.1  MPLS Description

18.1.1.1  MPLS Overview

Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes. The labels identify virtual links (paths) between distant nodes rather than endpoints. MPLS is scalable and protocol-independent. Data packets are assigned labels, which are used to determine packet forwarding destinations without examining the packet.

Arista switches utilize MPLS to improve efficiency and control from servers through data centers and to the WAN. The MPLS implementation supports static MPLS tunneling that is manually configured on each switch or established over a network by an SDN controller. The configuration is specified by a set of rules that filter packets based on matching criteria. Each rule applies MPLS-related actions to packets that match the rule's criteria. Each rule includes a metric that the switch uses to select an action when multiple rules match a packet.

18.1.1.2  MPLS Implementation

MPLS static rule parameters contain the following:

- A 20-bit value that is compared to the top header label of each MPLS packet. Other rule parameters may be applied to packets whose top label match this value.
- A nexthop location that specifies the packet's next destination (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- An MPLS label stack management action that is performed on filtered packets:
  - pop-payload: removes the top label from stack; this terminates an LSP (label-switched path).
  - swap-label: replaces top label with a specified new label; this passes a packet along an LSP.
A rule metric that the switch uses to select a rule when multiple rules match an MPLS packet. Packets that do not match any MPLS rules are dropped.

18.1.1.3 MPLSoGRE Filtered Mirroring

In MPLS over Generic Routing Encapsulation (MPLSoGRE) filtered mirroring, IPv4 over MPLS over GRE (IPv4oMPLSoGRE) and IPv6 over MPLS over GRE (IPv6oMPLSoGRE) packets that enter a GRE tunnel endpoint on which MPLS lookup is performed, are selected for mirroring based on the destination IP address field in the inner IPv4 or IPv6 header.

Note: These packets are not selected for mirroring if they are forwarded based on either the L2 or outer L3 header destination address.

The image below shows the header format of the packets that are selected for mirroring.

<table>
<thead>
<tr>
<th>Ethernet</th>
<th>Outer IPv4</th>
<th>GRE</th>
<th>MPLS</th>
<th>Inner IPv4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet</td>
<td>Outer IPv4</td>
<td>GRE</td>
<td>MPLS</td>
<td>Inner IPv6</td>
</tr>
</tbody>
</table>

![Figure 136: Header Format of Packets](image_url)

When mirroring to a GRE tunnel, the payload of the outgoing GRE packet contains the payload of the incoming source packet starting from the MPLS header. L2 and outer L3 headers are stripped from the mirror copy. When the MPLS lookup fails, the packet is still eligible for mirroring based on the selection criteria defined in the ACL.

18.1.1.4 Mixed TTL/DSCP in MPLS Tunnel Termination

A Label Edge Router (LER) decapsulating an MPLS packet may choose to source the TTL and DSCP fields from either the MPLS header or the original inner IPv4 header. However, some applications need the TTL field value from the MPLS header, while retaining the DSCP from the original IPv4 header. Mixed TTL/DSCP in MPLS Tunnel Termination enables tunnel termination to select this specific mix of two modes.

This section contains the following topics:

- Platform Compatibility
- Configuration
- Packet Support for IPv6

18.1.1.4.1 Platform Compatibility

Support for mixed TTL/DSCP in MPLS tunnel termination is available on the following platforms:

- DCS-7020R
- DCS-7280R/R2
- DCS-7500R/R2

18.1.1.5 Support for MPLS Packets in IP ACLs

Ingress and egress IPv4 and IPv6 access-lists do not automatically match the inner IP header when processing IP over MPLS traffic.

Support is now available to allow matching of the inner IP header in an access-list by adding the proper packet types to the corresponding TCAM features.
18.1.1.5.1 Platform Compatability

The following platforms support MPLS Packets in IP ACLs:

- DCS-7280R/R2
- DCS-7500R/R2

18.1.2 MPLS Configuration

MPLS routing is enabled through the `mpls ip` command.

- This command enables MPLS routing.

```plaintext
switch(config)#mpls ip
switch(config)#show running-config mpls ip
!
end
switch(config)#
```

MPLS rules are created by the `mpls static` command. MPLS static rules identify a set of MPLS packets by a common top label and defines the method of handling these packets.

```plaintext
These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop payload-type ipv4
switch(config)#show running-config
!
end
```

```plaintext
These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule’s metric value of 150 assigns it backup status prior to the first rule.

switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop payload-type ipv4 metric 150
switch(config)#show running-config
!
```

```plaintext
end
```
These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```
switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
```

This command configures a static tunnel for the tunnel endpoint 64.0.0.1 and pushes a label 11111 to it.

```
switch(config)#mpls static STATIC 64.0.0.1/32 54.0.0.1 Port-Channel7 label-stack 11111
```

This example shows MPLS swap route configuration. The following CLI swaps a packet with MPLS top label 3400 to 5600 for forwarding to 10.14.4.4.

```
switch(config)#mpls static top-label 3400 10.14.4.4 swap 5600
```

This example shows MPLS next-hop groups configuration for MPLS. The following CLI shows the specification of a next hop group called TestGrp1 with two entries.

```
switch(config)#nexthop-group TestGrp1 type MPLS
switch(config-nexthop-group-TestGrp1)#size 2
switch(config-nexthop-group-TestGrp1)#entry 0 push label-stack 70 nexthop 10.20.30.5
switch(config-nexthop-group-TestGrp1)#entry 1 push label-stack 71 nexthop 10.20.30.6
switch(config-nexthop-group-TestGrp1)#exit
```
The label-stack keyword can take only one label. Tunnel-source and ttl config commands do not apply to MPLS NexthopGroups and are disabled. The nexthop entry is recursively resolved when the specified entry is a remote nexthop. The show command indicates the resolved, directly-attached nexthop.

The switch’s MPLS static rule configuration for specified routes and rules is displayed by show mpls route.

This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label  Out-Label  Metric  Payload  NextHop
3400      pop        100     ipv4     10.14.4.4,Et3/3/3
3400      pop        150     ipv4     10.14.4.4,Et4/3
switch>
```

Statistics about the configuration and implementation of MPLS rules are displayed by the show mpls route summary command.

This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```

The show mpls lfib route command displays the Label Forward Information Base of the switch.

```
switch(config)#show mpls lfib route
MPLS forwarding table (Label [metric] Vias) - 1 routes
MPLS next-hop resolution allow default route: False
Via Type Codes:
  M - MPLS via, P - Pseudowire via,
  I - IP lookup via, V - VLAN via,
  VA - EVPN VLAN aware via, ES - EVPN ethernet segment via,
  VF - EVPN VLAN flood via, AF - EVPN VLAN aware flood via,
  NG - Nexthop group via
Source Codes:
  G - gRIBI, S - Static MPLS route,
  B2 - BGP L2 EVPVN, B3 - BGP L3 VPN,
  R - RSVP, LP - LDP pseudowire,
  L - LDP, M - MLDP,
  IP - IS-IS SR prefix segment, IA - IS-IS SR adjacency segment,
  IL - IS-IS SR segment to LDP, LI - LDP to IS-IS SR segment,
  BL - BGP LU, ST - SR TE policy,
  DE - Debug LFIB
```
The `show ip route` command displays all IP routes along with static MPLS push routes and Nexthop Group routes.

```
switch(config)#show ip route
VRF name: default
Codes: C - connected, S - static, K - kernel, 
O - OSPF, IA - OSPF inter area, E1 - OSPF external type 1, 
E2 - OSPF external type 2, N1 - OSPF NSSA external type 1, 
N2 - OSPF NSSA external type2, B I - iBGP, B E - eBGP, 
R - RIP, I L1 - ISIS level 1, I L2 - ISIS level 2, 
O3 - OSPFv3, A B - BGP Aggregate, A O - OSPF Summary, 
NG - Nexthop Group Static Route, V - VXLAN Control Service

Gateway of last resort is not set 
C 192.0.2.0/24 is directly connected, Ethernet1/1 
S 3.3.3.0/24 [1/0] via 192.0.2.2, Ethernet1/1 label 200 
S 10.80.0.0/13 [1/0] via 172.24.0.1, Management1 
S 10.95.0.0/20 [1/0] via 172.24.0.1, Management1 
C 172.24.0.0/18 is directly connected, Management1 
S 172.16.0.0/12 [1/0] via 172.24.0.1, Management1
switch(config)#
```

The MPLS push routes are of type static so the `show ip route static` command also displays the output for an MPLS Nexthop Group assuming there is a route pointing to the NexthopGroup and the entries in the NexthopGroup are resolved. The output for `show nexthop-group TestGrp1` for the test group configured earlier is shown below.

```
switch(config)#show nexthop-group TestGrp1
TestGrp1 
   Id 2 
   Type MPLS 
   Size 2 
   Entries 
      0 push label-stack 70 nexthop 10.20.30.5 
      Tunnel destination directly connected, Ethernet2 
      52:14:a3:a6:50:e8, Ethernet2 
      1 push label-stack 71 nexthop 10.20.30.6 
      Tunnel destination directly connected, Ethernet2 
      52:14:a3:a6:50:e8, Ethernet2
switch(config)#
```

### 18.1.2.1 LSP Ping/Traceroute for MPLS Nexthop Group Tunnels

The `ping/traceroute mpls tunnel nexthop-group` command checks the liveness of Nexthop Group tunnel endpoint for an MPLS Nexthop Group.
The following displays the output for the ping command where the endpoint is specified.

```
switch(config)#rtrmpls1
switch(config-rtrmpls1)#ping mpls tunnel nexthop-group 100.0.116.1/32
LSP ping to nexthop-group tunnel 100.0.116.1/32

100.0.116.1/32: nexthop-group tunnel index 1 (nexthop-group name: nhg-100)
Entry 0
   Via 10.0.16.2
   Reply from 10.0.108.1: seq=1, time=507.546ms
Entry 1
   Via 10.0.16.8
   Reply from 10.0.113.1: seq=1, time=516.131ms

--- nexthop-group tunnel index 1, nexthop-group nhg-100: lsp ping statistics ---
Entry 0
   Via 10.0.16.2
   1 packets transmitted, 1 received, 0% packet loss, time 652ms
   1 received from 10.0.108.1, rtt min/max/avg 507.546/507.546/507.546 ms
Entry 1
   Via 10.0.16.8
   1 packets transmitted, 1 received, 0% packet loss, time 652ms
   1 received from 10.0.113.1, rtt min/max/avg 516.131/516.131/516.131 ms
```

The following displays the output where the endpoint is specified for traceroute command.

```
switch(config)#rtrmpls1
switch(config-rtrmpls1)#traceroute mpls tunnel nexthop-group 100.0.116.1/32
LSP traceroute to nexthop-group tunnel 100.0.116.1/32
Traceroute over nexthop-group tunnel index 1, nexthop-group nhg-100
Entry 1
Entry 1
   1  10.0.225.1        32.571ms
      label stack (top label first): 89
   2  10.0.227.1        42.866ms
      label stack (top label first): 109
   3  10.0.229.1        54.893ms
      label stack (top label first): 110
   4  10.0.231.1        15.946ms
      label stack (top label first): 111
   5  10.0.233.1        27.72ms
      label stack (top label first): 112
   6  10.0.113.1        36.383ms
```

The following displays the output for the ping command where the static route resolves over Nexthop Group tunnel(s).

```
switch(config-rtrmpls1)#ping mpls static ip 100.0.77.0/24
LSP ping to static MPLS push label route 100.0.77.0/24

100.0.77.0/24: nexthop-group tunnel index 1 (nexthop-group name: nhg-46)
Entry 0
   Via 10.0.25.5
   Reply from 10.0.51.1: seq=1, time=112.171ms
```

3139
The following displays the output for the `traceroute` command where the static route resolves over Nexthop Group tunnel(s). The command randomly selects a tunnel.

```
switch(config-rtrmpls1)#traceroute mpls static ip 100.0.77.0/24 LSP
traceroute to 100.0.77.0/24
100.0.77.0/24: nexthop-group tunnel index 1 (nexthop-group name: nhg-46)
100.0.77.0/24: nexthop-group tunnel index 2 (nexthop-group name: nhg-64)
Traceroute over nexthop-group tunnel index 1, nexthop-group nhg-46
Entry 0
  1  10.0.83.1         382.798ms
      label stack (top label first): 35
  2  10.0.85.1         42.7ms
      label stack (top label first): 47
  3  10.0.87.1         55.815ms
      label stack (top label first): 48
  4  10.0.89.1         17.728ms
      label stack (top label first): 49
  5  10.0.91.1         29.452ms
      label stack (top label first): 50
  6  10.0.51.1         38.686ms
```

18.1.2.2 Egress IPv4/IPv6 over MPLS ACLs

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (such as if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.
Multiprotocol Label Switching (MPLS)

- This command disables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

```
switch(config)#no mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
switch(config)#
```

- This command enables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

```
switch(config)#mpls static top-label 12000 120.1.1.1 pop payload-type ipv6
switch(config)#
```

18.1.2.3 Configuring MPLSoGRE Filtered Mirroring

The filtered mirroring of terminated MPLSoGRE packets is configured by creating an IPv4 access-list, and then attaching the IPv4 access-list to a monitor session source where a tunnel decap group has been configured. This IPv4 access-list has rules that match to either inner IPv4 or IPv6 destination addresses.

Enabling the TC-Counters TCAM Profile

The following limitations are applicable to MPLSoGRE filtered mirroring in tc-counters TCAM profile:
- Security ACLs are not enforced on IPv4oMPLSoGRE and IPv6oMPLSoGRE terminated packets.
- The rules of a mirroring-ACL are set to match either inner IPv4 or inner IPv6 header fields, but not both.

The ACLs containing rules to match both inner IPv4 and inner IPv6 header fields are not applicable to a single source interface in multiple mirroring sessions. In other words, all ACLs applied to a shared source interface must contain either inner IPv4 rules or inner IPv6 rules.

The commands below switch to the tc-counters TCAM profile in the running configuration.

```
switch(config)#hardware tcam
switch(config-hw-tcam)#system profile tc-counters
switch(config-hw-tcam)#exit
```

Defining Two IPv4 Access-Lists

The `ip access-list` command places the switch in ACL configuration mode, which is a group change mode that modifies an IPv4 access control list. The command specifies the name of the IPv4 ACL that subsequent commands modify and creates an ACL if it references a nonexistent list. All changes in a group change mode edit session are pending till the end of the session.

The `permit (Role)` command configures one access-list to match the inner IPv4 address, and the other access-list to match the inner IPv6 address.

```
switch(config)#ip access-list dIPv4
switch(config)#10 permit ip any any inner ip any host 5.5.5.5
switch(config)#exit
```
Attaching Access-Lists

The `monitor session source` and `monitor session destination` commands allow to attach two access-lists to two different monitor session sources.

```
switch(config)#ip access-list dIPv6
switch(config)#10 permit ip any any inner ipv6 any host 55::55
switch(config)#exit
```

```
switch(config)#monitor session sess1 source et1 rx ip access-group dIPv4
destination 2.2.2.2
switch(config)#monitor session sess1 destination tunnel mode gre source 1.1.1.1
switch(config)#monitor session sess2 source et2 rx ip access-group dIPv6
destination 4.4.4.4
switch(config)#monitor session sess2 destination tunnel mode gre source 3.3.3.3
```

```
switch(config)#show monitor session
Session sess1
------------------------
Source Ports:
   Rx Only:     Et1(IP ACL: dIPv4)
Destination Ports:
   status source dest   TTL  DSCP  proto    VRF      fwd-drop
   Gre1 : active 1.1.1.1 2.2.2.2 128   0     0x88be   default    no

Session sess2
------------------------
Source Ports:
   Rx Only:     Et2(IP ACL: dIPv6), Et5(IP ACL: dIPv6)
Destination Ports:
   status source dest    TTL  DSCP  proto    VRF        fwd-drop
   Gre2 : active 3.3.3.3 4.4.4.4 128   0     0x88be   default    no
```

18.1.2.4 Configuration

Mixed TTL/DSCP in MPLS tunnel termination is intended to be used with MPLS VRF decapsulation. Therefore, a static VRF-to-MPLS-label map is expected to be provided, similar to the following:

```
switch(config)#mpls ip
switch(config)#mpls static vrf-label mpls-label vrf vrf-name
switch(config)#ip routing vrf vrf-name
```

TTL=uniform and DSCP=pipe options have been added to the existing `mpls tunnel termination` command:

```
switch(config)#mpls tunnel termination model ttl uniform dscp pipe
```

Also, a new TCAM profile packet type has been introduced:

```
switch(config)#packet mpls ipv4 forwarding routed decap
```
Configuration occurs under the “qos ip” feature section of a user defined TCAM profile:

switch(config)#hardware tcam
# May use any profile that provides “qos ip”
switch(config-tcam)#profile name copy default
switch(config-tcam-profile-name)#feature qos ip
switch(config-tcam-profile-name-feature-qos-ip)#packet mpls ipv4 forwarding routed decap

18.1.2.4.1 Packet Support for IPv6

*RFE 391109* brings mixed TTL/DSCP support for IPv6 over MPLS packets as well. The TCAM profile configuration is similar to the above IPv4 configuration:

switch(config)#hardware tcam
# May use any profile that provides “qos ipv6”
switch(config-tcam)#profile name copy default
switch(config-tcam-profile-name)#feature qos ipv6
switch(config-tcam-profile-name-ipv6)#packet mpls ipv6 forwarding routed decap
switch(config-tcam)#system profile name

18.1.2.5 Configurations to Support IP ACLs for MPLS Packets

18.1.2.5.1 Ingress IP Access-List Support

To facilitate inner IP header matching, there are two TCAM profile packet types:

packet mpls ipv4 forwarding bridged
packet mpls ipv4 forwarding mpls

The ingress inner IP header matching creates a user-defined profile with these new packet types. Although MAC access-lists do not match on the inner IP header, you must add this packet type in order to generate a lookup for MPLS packets (if using MAC ACLs).

hardware tcam
#May use any profile that provides ACL features
profile <name> copy default
feature acl port ip
packet mpls ipv4 forwarding bridged
packet mpls ipv4 forwarding mpls
feature acl port ipv6
packet mpls ipv6 forwarding bridged
packet mpls ipv6 forwarding mpls
feature acl port mac
packet mpls ipv4 forwarding bridged
packet mpls ipv4 forwarding mpls
packet mpls ipv6 forwarding bridged
packet mpls ipv6 forwarding mpls
system profile <name>
Starting in the EOS 4.23.1 Release, ingress on inner IP header matching in MPLS packets is also supported on PBR ACLs. In order to enable this, the following must be configured in a user-defined TCAM profile:

```
hardware tcam
  #May use any profile that provides ACL features
  profile <name> copy default
  feature pbr ip
    packet mpls ipv4 forwarding mpls
  feature pbr ipv6
    packet mpls ipv6 forwarding mpls
```

### 18.1.2.5.2 Egress IPv4/IPv6 over MPLS ACLs

IPv4/IPv6 over MPLS packets are now eligible for ACLs at the egress stage by default, applicable only to IPv4/IPv6 over MPLS packets that are MPLS label popped (such as if the label is at the bottom of stack). The user can override this behavior if required, thereby disabling egress ACLs for certain MPLS labels by configuration. No special configuration is required to enable egress ACLs on IPv4/IPv6 over MPLS packets.

- This command disables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

  ```
  switch(config)#no mpls static top-label 12000 120.1.1.1 pop
  payload-type ipv6
  switch(config)#
  ```

- This command enables egress ACLs for MPLS top-label 12000 on the egress interface 120.1.1.1 nexthop address.

  ```
  switch(config)#mpls static top-label 12000 120.1.1.1 pop
  payload-type ipv6
  switch(config)#
  ```

### 18.1.2.5.3 MPLS Pop Terminated Packets

To enable the use of these qualifiers on MPLS-terminated packets by last label pop, this feature must be applied to the current TCAM profile, as illustrated below:

```
feature acl port ip egress mpls-tunnelled-match
```

No functionality is lost, however, this feature is not enabled by default on all system profiles. Some TCAM profiles may also use the resources required by this feature. Verification is required to ensure the current user-defined TCAM profile supports this feature.

```
hardware tcam
  #May use any profile that provides ACL features
  profile <name> copy <some-system-profile>
    feature acl port ip egress mpls-tunnelled-match
  system profile <name>
```
18.1.2.5.4  MPLS VRF-Decapsulated Packets

To enable the use of these new qualifiers on MPLS-terminated packets by last label VRF-label mapping, the packet type `mpls ipv4 forwarding routed decap` must be applied to at least one feature in the TCAM profile. For example:

```
hardware tcam
    profile <name> copy default
    feature qos ip
        packet mpls ipv4 forwarding routed decap
    system profile <name>
```

18.2  BGP/MPLS L3 VPN

Border Gateway Protocol/ Multiprotocol Label Switching (BGP/MPLS) L3 Virtual private Network (VPN) allows a Service Provider (SP) or an Enterprise to provide the service of interconnecting geographically dispersed customer sites. This type of service can be provided to multiple customers over the common network backbone infrastructure of the Service Provider, while:

- Maintaining privacy of each customer
- Allowing for overlapping IP addresses among customers
- Having constrained route distribution – such as, only those routers in the Service Provider’s network that need the customer routes, have them.

Achieve the above through the extensions to BGP as defined in RFC 4364 for IPv4 and RFC 4659 for IPv6, and the use of VPN Routing and Forwarding Tables (VRFs), Route Distinguishers (RDs), and Route Targets (RTs).

BGP/MPLS L3 VPN is available when configuring BGP in the multi-agent routing protocol model.

</tbody>
</table>
18.2.2 Operation

A Virtual Private Network, or VPN, is a set of geographically dispersed sites attached to the Service Provider's (SP) backbone, with IP interconnectivity amongst the sites. Using this scenario, the customer can obtain "VPN service" from the SP. The SP will provide a VPN service to multiple customers, using this common backbone network infrastructure. The sample VPN topology diagram below illustrates three sites where a customer is being interconnected over the SP backbone network.

At each site, the Customer Edge router (CE) attaches to the Provider's Edge router (PE). The CE can attach to more than one PE, and in these cases the CE is said to be "multi-homed". The routers in the SP core network, those which do not attach to any CE, are referred to as "P" routers. The "P" routers do not need to know about the customer routes.

![Figure 137: MPLS Enabled Core Schematic](image)

The CE attaches to PE in a VRF. The routes learned from the CE are programmed in the corresponding VRF and the PE then distributes the routes to other PEs as "VPN routes" using MP-BGP. This is done by using two new BGP address families, VPN-IPv4 (AFI=1, SAFI=128) and VPN-IPv6 (AFI=2, SAFI=128).

On the PEs, corresponding to the VPN, VRFs configure with the RD and one or more import and export RTs. The RD attaches to the customer route to create a VPN route. By picking a unique RD for each VRF and attaching it to the customer route, the VPN route is unique. This allows for customers with overlapping IP addresses to be managed by the Service Provider. This unique VPN route is advertised to other PEs along with the configured export RT and the VPN label. The PE router allocates a VPN label per VRF and address family. The PE router programs its Label FIB (LFIB) with this label information. When the PE router receives an incoming MPLS packet with the VPN label as the topmost label, it pops the label and does an IP lookup in the associated VRF. The PE router also maintains a mapping of import RTs to the corresponding VRFs. This mapping is used later when deciding into which VRFs a received VPN route should be imported into.

The PE learns customer routes from the CE through the PE-CE routing protocol, which could be Static routing, EBGP, OSPF, or ISIS. The PE will install those customer routes in the associated VRF, with the CE as the nexthop. The customer routes in the VRF are exported into the BGP VPN table as VPN routes, along with the VPN label and the configured export RTs as BGP path attributes. These VPN routes are then advertised to other PEs which have been activated for the VPN address-families (VPN-IPv4/VPN-IPv6). The PE then sets itself as the nexthop while advertising the VPN routes. The PE which receives those VPN routes strips out the RD and import them as IPv4 or IPv6 routes into the VRFs. The list of VRFs into which the route is imported is determined based on the mapping of import RTs to VRFs. These routes will be programmed into the FIB along with the VPN label and the remote PE as the nexthop. Once these routes are installed in the VRF, the CE connected to that VRF...
Multiprotocol Label Switching (MPLS)

will learn those routes (based on the PE-CE routing protocol) and make it available it in the customer network that it is attached to. This way the geographically dispersed customer sites learn of each other’s networks and IP reachability is established between them.

18.2.2.1 Forwarding

In the Service Provider’s core network there should be MPLS LSPs between the PEs. That is, the connection to the VPN next-hop should be over an MPLS tunnel. The MPLS LSPs in the core could be setup using RSVP-TE or LDP in conjunction with OSPF/ISIS or ISIS-SR.

When the PE receives an IP packet from the CE destined to the remote site, it does an IP lookup in the VRF to which the CE is connected. This lookup provides the VPN label to be used and the nexthop, which would be the remote-PE. The VPN label is imposed on the IP packet and the resulting MPLS packet is then tunneled through the MPLS LSP to the remote PE. As result of penultimate hop popping, the MPLS packet arrives at the remote PE with the VPN label as the topmost label. The label lookup results in the VPN label being popped and an IP lookup will be done in the associated VRF. Note that the PE would have programmed this label action when it allocated the label to start with. That IP lookup will result in the IP packet being forwarded out to the CE.

18.2.3 Configuration

Configuring BGP/MPLS L3 VPN involves enabling the SP core for MPLS and then configuring the PEs with the required BGP configuration.

It is assumed that the SP core network is enabled for MPLS. This involves configuring an IGP (OSPF/ISIS) followed by a label distribution protocol such as LDP, RSVP-TE or ISIS-SR. Typically, loopback interfaces are configured on all the PE and the P routers and the IGPs exchange reachability to those loopback interfaces. And then the MPLS Label Distribution Protocol will set up MPLS LSPs/tunnels between all those loopbacks.

This section includes the following topics:

- LDP Hello Redundancy
- Enabling BGP to Exchange the Routing Tables with the Peer
- Configuring the VRF Information
- Configuring the Route Distinguisher
- Configuring Route Targets
- Configuring Import / Export Route-maps
- VPN Next-hop

Enabling MPLS and LDP on the PE involves the following steps:

1. Configure terminal.
   ```bash
   switch# configure terminal
   ```
2. Enter the `Loopback0` interface config mode.
   ```bash
   switch(config)# interface Loopback0
   ```
3. Enter destination IP address.
   ```bash
   switch(config)# ip address 11.0.0.1/32
   ```
4. Enable MPLS routing.
   ```bash
   switch(config)# mpls ip
   ```
5. Configure MPLS LDP.

```
switch(config)#mpls ldp
```

6. Configure the router ID interface.

```
switch(config-mpls-ldp)#router-id interface Loopback0
```

7. Configure for no shutdown.

```
switch(config-mpls-ldp)#no shutdown
```

Example:

```
switch#configure terminal
switch(config)#interface Loopback0
switch(config-if)#ip address 11.0.0.1/32
switch(config)#mpls ip
switch(config)#mpls ldp
switch(config-mpls-ldp)#router-id interface Loopback0
switch(config-mpls-ldp)#no shutdown
```

### 18.2.3.1 LDP Hello Redundancy

LDP Hello Redundancy establishes a redundant target Hello adjacency for each neighbor discovered through the Basic Discovery Mechanism using the LDP Extended Discovery mechanism. For the mechanism to work, the following must be true:

- Devices must have a loopback interface configured to serve as the transport address interface, which must be routable through all interfaces on the device.
- Devices must be reachable via a redundant path through other devices on the network.
- Both devices must have Hello Redundancy configured or the targeted Hello messages will be ignored.

After a Hello adjacency is established using LDP Basic Discovery, devices with Hello Redundancy will start sending Targeted Hello messages to the Transport Address found in the received Link Hello message of Basic Discovery. The Targeted Hello adjacency can support the session established between peers even when all Link Hello adjacencies have timed out. The FEC label bindings between two peers with no Link Hello adjacency will not be active because the Interior Gateway Protocol will not use the other peer as the next hop. Maintaining the FEC label bindings and the session between the two peers can save significant time when the Link Hello adjacency is reestablished.

The `neighbor hello-redundancy` command configures Hello Redundancy on all platforms under the LDP configuration mode. If a Link Hello adjacency is restored within 600 seconds of being lost, the Target Hello adjacency and the session associated with it will be dropped. The timeout can be configured using the `duration` option of the command. An infinite value for the `duration` disables the timeout.

#### Configuration for LDP Hello Redundancy

The following example is applicable to all platforms.

These commands enable Targeted Hello redundancy with a duration of 300 seconds.

```
switch(config-mpls-ldp)#neighbor hello-redundancy
duration 300
```

3148
Either of the following commands in the example below disable Hello Redundancy.

```
switch(config-mpls-ldp)#neighbor hello-redundancy none
switch(config-mpls-ldp)#default neighbor hello-redundancy
```

The following command shows the Targeted Hello adjacencies established.

```
switch(config)#show mpls ldp discovery detail
LDP MD5 Password Not Set
Local LDP Identifier: 2.2.2.2:0
Discovery Sources:
  Interfaces:
    Ethernet1 (ldp):
      Hello interval: 5 sec; Source IP addr: 192.168.2.1
      LDP ID: 3.3.3.3:0
      Source IP addr: 192.168.2.2; Transport IP addr: 3.3.3.3
      Hold time: 15 sec; Proposed local/peer: 15/15 sec; Expires
      in: 11.96 sec
    Ethernet2 (ldp):
      Hello interval: 5 sec; Source IP addr: 192.168.1.2
      LDP ID: 1.1.1.1:0
      Source IP addr: 192.168.1.1; Transport IP addr: 1.1.1.1
      Hold time: 15 sec; Proposed local/peer: 15/15 sec; Expires
      in: 12.00 sec
  Targeted Hellos:
    Targeted neighbor 1.1.1.1:
      Hello interval: 15 sec; Source IP addr: 2.2.2.2
      LDP ID: 1.1.1.1:0
      Source IP addr: 1.1.1.1; Transport IP addr: 1.1.1.1
      Hold time: 45 sec; Proposed local/peer: 45/45 sec; Expires
      in: 40.78 sec
    Targeted neighbor 3.3.3.3:
      Hello interval: 15 sec; Source IP addr: 2.2.2.2
      LDP ID: 3.3.3.3:0
      Source IP addr: 3.3.3.3; Transport IP addr: 3.3.3.3
      Hold time: 45 sec; Proposed local/peer: 45/45 sec; Expires
      in: 35.89 sec
```

18.2.3.2 Enabling BGP to Exchange the Routing Tables with the Peer

- Enabling the send-community extended knob on the neighbor. This essentially enables BGP to exchange the RTs with the peer.
  - Activating the peer (the remote PE) under the `address-family VPN-IPv4` and `address-family VPN-IPv6` modes enables BGP to negotiate the MPLS L3 VPN address families.
  - Specify the address for the VPN next-hop using the command, `neighbor default encapsulation mpls next-hop-self source-interface Loopback0`.

In the preceding configuration example, the system uses the address `11.0.0.1` from interface `Loopback0` as the nexthop in the VPN route advertisements.

18.2.3.3 Configuring the VRF Information

First, the VRF must be configured in the global mode and IPv4 and IPv6 routing must be enabled in the VRF. After that, under the router bgp mode, we need to configure the VRF and provide the information related to RD and import and export RTs.
1. Configure terminal.

```
switch#configure terminal
```

2. Enable IP routing.

```
switch(config)#ip routing
```

3. Enable IP routing for the VRF.

```
switch(config)#ip routing vrf vrf1
```

4. Enable IPv6 routing for the VRF.

```
switch(config)#ipv6 unicast-routing vrf vrf1
```

The VRF configuration under router BGP mode is shown below.

```
switch(config-router-bgp-vrf-vrf1)#show active
router bgp 300
  vrf vrf1
    rd 11.0.0.1:0
    route-target import vpn-ipv6 300:0
    route-target import vpn-ipv4 300:0
    route-target import vpn-ipv4 300:0
    route-target import vpn-ipv4 300:0
    route-target import vpn-ipv4 300:0
    route-target export vpn-ipv6 300:0
    route-target export vpn-ipv4 300:0
    route-target export vpn-ipv4 300:0
    redistribute connected
    redistribute static
switch(config-router-bgp-vrf-vrf1)#
```

18.2.3.4 Configuring the Route Distinguisher

The Route Distinguisher (RD) is structured such that it can be easily configured and managed. It is configured by specifying two fields separated by a colon, as in administrative-subfield: assigned-number-subfield.

The administrative subfield could contain either an IP address, as shown in the example (the PEs loopback address), or the AS number. The assigned-number-subfield can be any number which is determined by the SP. The primary requirement of the RD is that it must be unique per VRF. It is possible to have overlapping address space between VRFs, the intent of the RD is to ensure that a VPN route can be uniquely identified as it is received by a remote PE. However, the identification of which VRF(s) the received VPN route should be imported into is handled by the import RTs configured on the remote PE.

18.2.3.5 Configuring Route Targets

Next is the import and export Route Target configuration. The RTs are structured similar to the RDs. They too are made up of administrative-subfield: assigned-number-subfield. In the example shown, the AS number has been used as the administrative subfield. And the value 0 has been used for the assigned number subfield. It is the RT that plays an important role in identifying the VPN.
Multiprotocol Label Switching (MPLS)

- Received VPN routes with the import RT as path attributes will be imported into the VRF will have RTs has extended-community BGP path attributes. They will be imported into VRFs which import RT configuration for RTs in the received VPN route.
- And while advertising the routes from the VRF as VPN routes, the export RT will be attached to the route as an extended-community BGP attribute.
  1. In the example, the connected and static routes in the VRF are redistributed into BGP. And these routes will be exported as VPN routes.
  2. It is also possible to have a BGP session with the CE. In that case, routes received over that session are exported as VPN routes. And imported routes are advertised to the CE.

18.2.3.6 Configuring Import / Export Route-maps

The routes that are imported into a VRF can be further controlled by applying an import route-map. And the routes that are exported from the VRF can be controlled by applying an export route-map.

Complete the following steps:

1. Configure terminal.

switch#configure terminal

2. Configure BGP. In this example, BGP is configured AS 4274781899.

switch(config)#router bgp 4274781899

3. Configure the VRF under router bgp mode.

switch(config-router-bgp)#vrf vrf1

4. Select the BGP route distinguisher. In this example, 36351:268450419 is selected.

switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419

5. Configure the import route-target VPN-IPv4, unicast address family. In this example, 36351:1001 is selected.

switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001

6. Configure another import route-target for VPN-IPv4 unicast address family. In this example, 36351:268450419 is selected.

switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419

7. Configure the export route-target for VPN-IPv4 unicast address family. In this example, 36351:268450419 is selected.

switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419

8. Configure the import route-map. In this example, the import router-map name is BGP-IMPORT-VRF-SERVICES.

switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES
9. Configure the export route-map. In this example, the export route-map name is `BGP-EXPORT-VRF-VRF1`.

```
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1
```

10. Optionally, redistribute connected routes in the VRF into BGP, with the associated route-map `BGP-ANNOUNCE-CONNECTED`.

```
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED
```

11. Optionally, redistribute static routes in the vrf into BGP, with associated route-map `BGP-ANNOUNCE-STATIC`.

```
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC
```

12. The import and export route-maps should be separately configured. The configuration snippet below shows the configuration of the same route-map `BGP-IMPORT-VRF-SERVICES`.

```
switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```

**Example:**

```
switch#configure terminal
switch(config)#router bgp 4274781899
switch(config-router-bgp)#vrf vrf1
switch(config-router-bgp-vrf-vrf1)#rd 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:1001
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target import vpn-ipv4 36351:268450419
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-IMPORT-VRF-SERVICES
switch(config-router-bgp-vrf-vrf1)#route-target export vpn-ipv4 route-map BGP-EXPORT-VRF-VRF1
switch(config-router-bgp-vrf-vrf1)#redistribute connected route-map BGP-ANNOUNCE-CONNECTED
switch(config-router-bgp-vrf-vrf1)#redistribute static route-map BGP-ANNOUNCE-STATIC
switch(config-router-bgp-vrf-vrf1)#route-map BGP-IMPORT-VRF-SERVICES permit 10
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match extcommunity SERVICES
switch(config-route-map-BGP-IMPORT-VRF-SERVICES)#match ip address prefix-list SERVICES
```
18.2.3.7 **VPN Next-hop**

By default, the system uses the source address of the BGP session as the next-hop in the VPN advertisements. This source address is determined by the system while establishing the TCP session between the PEs. If the SP want to use a different address as the VPN next-hop, then an interface with that address must be specified under the BGP address-family VPN-IPv4 or address-family VPN-IPv6 configuration modes. For example,

```
switch(config-router-bgp)#address-family vpn-ipv4
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self
source-interface Loopback0

switch(config-router-bgp)#address-family vpn-ipv6
switch(config-router-bgp-af)#neighbor 10.0.0.2 activate
switch(config-router-bgp-af)#neighbor default encapsulation mpls next-hop-self
source-interface Loopback0
```

In the previous example, the interface *Loopback 0* has been specified. The system picks the VPN next-hop address from the interface based on the following rules:

- For VPN-IPv4, the IPv4 address from the interface is picked.
- For VPN-IPv6,
  - For an IPv4 peer,
    - Pick the IPv4 address from the interface.
    - If the interface does not have a IPv4 address, pick the IPv6 address.
  - For an IPv6 peer,
    - Pick the IPv6 address from the interface.
    - If the interface does not have an IPv6 address, pick the IPv4 address.

For VPN-IPv6, when an IPv4 address is picked as the next-hop, it is encoded as a IPv4-mapped IPv6 address in the VPN route advertisement. This is as per RFC 4659.

### 18.2.4 Show Commands

Use the `show bgp instance vrf vrf1` command to show the BGP instance status for a specific VRF to verify the route-targets and import/export route-maps being used. The command also displays the locally allocated MPLS label that the system has allocated for IPv4 and IPv6.

```
switch#show bgp instance vrf vrf1
BGP instance information for VRF vrf1
BGP Local AS: 4274781899, Router ID: 169.254.156.10
Total peers: 0
  Static peers: 0
  Dynamic peers: 0
  Disabled peers: 0
  Established peers: 0
Four Octet ASN mode enabled
Graceful restart helper mode disabled
Graceful restart mode disabled
Graceful restart timer timeout: 00:05:00
End of rib timer timeout: 00:05:00
Attributes of the reflected routes are not preserved
UCMP mode: disabled
Peer mac resolution timeout: 00:00:00
```
BGP IPv4 Listen Port Status: listening on port 179
BGP IPv6 Listen Port Status: listening on port 179

BGP Convergence information:
  BGP has converged: yes, Time taken to converge: 00:00:31
  Outstanding EORs: 0, Outstanding Keepalives: 0
  Convergence timeout: 00:05:00
BGP Convergence timer is inactive
BGP Convergence based update synchronization is disabled
BGP Convergence slow-peer timeout: 00:01:30

Address-family IPv4 Unicast:
  Redistributed routes into BGP:
    Static
    Connected
  Route Distinguisher: 36351:268450419
  Route targets to import:
    VPN-IPv4:
      36351:1001
      36351:268450419
  Route targets to export:
    VPN-IPv4:
      36351:268450419
  Route maps to apply on import:
    VPN-IPv4: BGP-IMPORT-VRF-SERVICES
  Route maps to apply on export:
    VPN-IPv4: BGP-EXPORT-VRF-DI-0056
  Local IP lookup MPLS VRF label: 135275
  Additional-paths installation is disabled
  Extended next-hop capability is disabled

Address-family IPv6 Unicast:
  Redistributed routes into BGP:
    Static
    Connected
  Route Distinguisher: 36351:268450419
  Route targets to import:
    VPN-IPv6:
      36351:1001
  Route targets to export:
    VPN-IPv6:
      36351:268450419
  Local IP lookup MPLS VRF label: 135896
  Additional-paths installation is disabled

Use the `show bgp neighbors` command to verify that the VPN address families have negotiated with the neighbor.

```
switch#show bgp neighbors
BGP neighbor is 10.0.0.2, remote AS 300, internal link
  BGP version 4, remote router ID 0.0.1.1, VRF default
  Last read 00:00:15, last write 00:00:31
  Hold time is 180, keepalive interval is 60 seconds
  Configured hold time is 180, keepalive interval is 60 seconds
  Hold timer is active, time left: 00:02:02
  Keepalive timer is active, time left: 00:00:16
  Connect timer is inactive
  Idle-restart timer is inactive
  BGP state is Established, up for 00:44:18
  Number of transitions to established: 1
  Last state was OpenConfirm
  Last event was HoldTime
  Neighbor Capabilities:
    Multiprotocol IPv4 Unicast: advertised and received and negotiated
    Multiprotocol VPN-IPv4: advertised and received and negotiated
    Multiprotocol VPN-IPv6: advertised and received and negotiated
```
Four Octet ASN: advertised and received and negotiated
Route Refresh: advertised and received and negotiated
Send End-of-RIB messages: advertised and received and negotiated
Additional-paths recv capability:
  IPv4 Unicast: advertised
  VPN-IPv4: advertised
  VPN-IPv6: advertised
Additional-paths send capability:
  IPv4 Unicast: received
  VPN-IPv4: received
  VPN-IPv6: received
Restart timer is inactive
End of rib timer is inactive
IPv4 Unicast End-of-RIB received: Yes
VPN-IPv4 End-of-RIB received: Yes
VPN-IPv6 End-of-RIB received: Yes
Message Statistics:

Configured maximum total number of routes is 12000
Inbound updates dropped by reason:
  AS path loop detection: 0
  Malformed MPBGP routes: 0
  Originator ID matches local router ID: 0
  Nexthop matches local IP address: 0
Local AS is 300, local router ID 0.0.0.1
Local TCP address is 10.0.0.1, local port is 179
Remote TCP address is 10.0.0.2, remote port is 47400

Use the `show bgp vpn-ipv4 summary` command to show the status of VPN-IPv4 peers. While the examples below are with respect to VPN-IPv4, the same set of commands are applicable to VPN-IPv6.

```
switch#show bgp vpn-ipv4 summary
BGP summary information for VRF default
Router identifier 0.0.0.1, local AS number 300
Neighbor Status Codes: m - Under maintenance
 Neighbor  V AS  MsgRcvd MsgSent InQ OutQ Up/Down State PfxRcd PfxAcc
10.0.0.2  4 300 3379    60      0   0    1d23h   Estab  1      1
```

Use the `show bgp vpn-ipv4` command to show how the VPN-IPv4 routes sent and received.

```
switch#show bgp vpn-ipv4
BGP routing table information for VRF default
Router identifier 0.0.0.1, local AS number 300
Route status codes: s - suppressed, * - valid, > - active, # - not installed, E - ECMP head, e - ECMP
 S - Stale, c - Contributing to ECMP, b - backup % - Pending BGP convergence
Origin codes: i - IGP, e - EGP, ? - incomplete
AS Path Attributes:Or-ID - Originator ID,C-LST - Cluster List,LL Nexthop-Link
```
Each entry in the output represents a VPN path in the VPN table. For each VPN path, the RD and actual prefix along with the nexthop information is shown. Paths in the VPN table are either received from other VPN-IPv4 peers (other PEs) or exported from local VRFs.

In the above output, **20.0.0.0/24** is a local route that has been exported. Notice that it has been prepended with the RD **11.0.0.1:0** to make it a VPN-IPv4 route. And the prefix of **20.0.1.0/24** has been received from another PE. It has the RD of **11.0.1.1:0** with a nexthop of **11.0.1.1**. Looking at each of those prefixes in detail:

**20.0.0.0/24** is a local route from one of the VRFs that has been exported. Notice that along with the prefix, the RD, the export RT and the MPLS label information is displayed. In this case, the MPLS label is a locally allocated label.

---

**Note:** Route-Distinguishers for the non-default VRFs must be configured under the `router bgp` mode. Route-Distinguisher configured under the VRF definition mode are ignored.

The route is installed in the VRF only when the VPN next-hop is reachable through an MPLS tunnel. The presence of such an MPLS tunnel can be verified using the `show tunnel fib` command. The output below shows that there is an MPLS tunnel setup by LDP to the VPN nexthop **11.0.1.1**.

---

Use the `show ip bgp vrf vrf1` command to show the BGP table for the VRF which contains the imported VPN-IPv4 route.
Multiprotocol Label Switching (MPLS)

AS Path Attributes: Or-ID-Originator ID, C-LST-Cluster List, LL Nexthop

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Each entry in the table represents a path either locally redistributed/received into the VRF (from a BGP peer) or imported from the VPN table.

Use the `show ip bgp 20.0.1.0/24 vrf vrf1` command for a more detailed view of the imported IP prefix 20.0.1.0/24:

```
switch#show ip bgp 20.0.1.0/24 vrf vrf1
BGP routing table information for VRF vrf1
Router identifier 11.0.0.1, local AS number 300
BGP routing table entry for 20.0.1.0/24
Paths: 1 available
  Local
    11.0.1.1 from 10.0.0.2 (0.0.1.1), imported VPN-IPv4 route, RD 11.0.1.1:0
    Origin IGP, metric -, localpref 100, weight 0, valid, internal, best
    Extended Community: Route-Target-AS:300:0
    Remote MPLS label: 100123
```

Use the `show ip route vrf vrf1` command to view the prefix installed in route table of the VRF:

```
switch#show ip route vrf vrf1
VRF: vrf1
Gateway of last resort is not set
C     20.0.0.0/24 is directly connected, Ethernet5
B I   20.0.1.0/24 [200/0] via 11.0.1.1/32,LDP tunnel index 1,label 100123
      via 10.0.0.2, Ethernet3, label imp-null(3)
```

The output displays both the VPN label, as well as the underlay tunnel (LDP) information.

18.2.5 Limitations

- While configuring a BGP Route-Reflector for the VPN-IPv4/VPN-IPv6 address families, the route-reflector must have transport MPLS LSPs to reach the PE nexthop addresses. Even though the route-reflector may not be in the data path and does not use the transport LSPs to forward traffic, the LSPs are required in order for the BGP nexthops to be considered as reachable valid candidates in the bestpath computation.
- When configuring eBGP peers, which receive routes over an eBGP session and re-advertise the same to a different eBGP peer, next-hop-unchanged knob must be configured, so that the original nexthop is retained.
- With iBGP route-reflector topology, next-hop-self knob must not be configured.
• Even with directly connected PEs, the VPN nexthops should be the loopback on the directly connected PEs with an MPLS tunnel between them.
• For a VPN route to be installed in the VRF, the VPN nexthop must resolve over a MPLS tunnel.
• With OSPF as the PE-CE protocol, RFC 4576, setting of the DN bit in the LSA, is not supported.
• Internal BGP (iBGP) as the PE-CE protocol, RFC 6368, is not supported.

18.3 RSVP-TE LSR
RSVP-TE applies the Resource Reservation Protocol (RSVP) for Traffic Engineering (TE), that is, to distribute MPLS labels for steering traffic and reserving bandwidth.

The EOS implementation supports:
• RSVP-TE core protocol ([RFC 2205], [RFC 3209]), transit role
• Hello messages ([RFC 3209])
• Refresh overhead reduction ([RFC 2961])
• Cryptographic authentication ([RFC 2747])
• Fast Reroute: facility backup, link-protection/NHOP ([RFC 4090])
• LSP Ping/Traceroute ([RFC 4379])
• Fast Reroute node-protection (Starting in EOS Release 4.22.1F)
• Bandwidth management (Starting in EOS Release 4.22.1F)
• SRLG for Fast Reroute (Starting in EOS Release 4.23.1F)
• MTU signaling (Starting in EOS Release 4.23.1F)
• Soft preemption (Starting in EOS Release 4.23.1F)
• Support for OSPFv2 as the IGP (Starting in EOS Release 4.24.2F)

18.3.1 Platform Compatibility
RSVP-TE is supported on the Arista 7500R and the 7280R family of switches.

18.3.2 RSVP-TE LSR Configuration
There is a dedicated configuration sub-mode for RSVP:

```
(config)# mpls rsvp
(config-mpls-rsvp)#
```

18.3.2.1 Enabling RSVP-TE
Enable RSVP-TE globally by issuing `no shutdown` in the configuration sub-mode. This is the only mandatory setting for RSVP-TE to work. This also globally enables MPLS.

```
(config-mpls-rsvp)# no shutdown
```

To disable RSVP-TE, use the `shutdown` command, which is the default.

```
(config-mpls-rsvp)# shutdown
```

There is no per-interface knob to enable and disable RSVP. However, you can only enable RSVP on interfaces that MPLS is also enabled.
18.3.2.2 State Refresh Parameter

You can configure the state refresh interval. It describes parameter R in seconds, leading to a state refresh (Path and Resv messages) every 0.5*R to 1.5*R seconds (randomly chosen). The default value is 30 seconds.

```
(config-mpls-rsvp)#refresh interval 30
```

18.3.2.3 Hello Messages

To configure the Hello message interval (sec) and timeout multiplier (integer), refer to the following example.

In this example, hello messages are sent to all known neighbors every 10 seconds. If no hello responses are received from a neighbor for 4*10=40 seconds, communication is considered to be lost and the neighbor is reset.

```
(config-mpls-rsvp)#hello interval 10 multiplier 4
```

The default of 10 seconds with multiplier 4 can be reset with:

```
(config-mpls-rsvp)#default hello interval
```

To explicitly disable Hello messages, use the following command:

```
(config-mpls-rsvp)#no hello interval
```

18.3.2.4 Refresh Overhead Reduction

Setting the refresh method to bundled enables the Refresh Overhead Reduction (RFC 2961) that supports the sending of message IDs and refreshing state with refresh messages.

```
(config-mpls-rsvp)#refresh method bundled
```

This is also the default setting. To turn off refresh overhead reduction, use explicit.

```
(config-mpls-rsvp)#refresh method explicit
```

18.3.2.5 Cryptographic Authentication Extension

Cryptographic Authentication (RFC 2747) is enabled by setting the authentication type to md5 and configuring an active password.

```
(config-mpls-rsvp)#authentication type md5
```

The default is none, which disables cryptographic authentication.

Authentication secrets are configured with an index. One of the indices should be chosen as the actively used password:

```
(config-mpls-rsvp)#authentication index 1 password s3cr3t
(config-mpls-rsvp)#authentication index 1 active
```

The active password is used to authenticate outgoing messages. All configured passwords are accepted for authentication of incoming packets, which allows smooth key rollover.
Password obfuscation is available:

```
(config-mpls-rsvp)#authentication index 1 password 7 07092E43
```

The size of the sequence number reorder window can be changed to accommodate a larger number of out-of-order packets. A value of $N$ means that a packet is accepted if all earlier received packets with a higher sequence number are within the preceding $N-1$ packets.

```
(config-mpls-rsvp)#authentication sequence-number window 5
```

The default value is 5. A value of 1 effectively turns off support for packet reordering.

### 18.3.2.6 Fast Reroute Extension

Support for Fast Reroute (FRR) link protection/NHOP (RFC 4090) is enabled by setting the Fast Reroute mode to `link-protection`.

```
(config-mpls-rsvp)#fast-reroute mode link-protection
```

To turn off FRR, change the mode to the default setting `none`.

```
(config-mpls-rsvp)#fast-reroute mode none
```

This setting only applies to Point of Local Repair (PLR) behavior, for example, the router is the upstream node relative to a to-be-protected link over which an LSP is routed. Merge Point (MP) behavior is always enabled and not affected by this setting.

Support for Node Protection is present starting in EOS Release 4.22.1F, so the above CLI also accepts an additional mode `node-protection`.

You can change the revertive behavior of the FRR from the `global` revertive mode to the `local` revertive mode. In the `global` revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is dead keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the `local` revertive mode, the LSR switches back to using the primary link after recovery.

```
(config-mpls-rsvp)#fast-reroute reversion local
```

The default for reversion is `global`.

```
(config-mpls-rsvp)#fast-reroute reversion global
```

### 18.3.2.7 Shared Risk Link Group

Starting in EOS Release 4.23.1F, there is an additional config command to configure SRLG mode.

```
srlg [strict]
no srlg [strict]
default srlg [strict]
```

This command specifies if link SRLGs of a primary LSP are to be considered as constraints while creating a fast-reroute bypass tunnel with either link or node protection. When `srlg` is specified with the `strict` keyword, then if a path for a bypass tunnel excluding SRLGs of the next-hop interface of primary LSP cannot be found, RSVP does not set up the bypass tunnel. When `srlg` is specified without a `strict` keyword, then a bypass tunnel is set up with as many links as possible that exclude the SRLGs of the next-hop interface of primary LSP and where such links are not available, links that have the least number of SRLGs which are to be excluded are used.
When this CLI is not configured, the behavior remains the same as before, which is to turn off SRLG processing. Therefore, the no and default versions of the command take you back to the default of SRLG processing being turned off.

The SRLGs of an interface can be configured using the following traffic-engineering CLI as below:

```
(config)#interface Et1
(config-if-Et1)#traffic-engineering srlg 100

(config)#interface Et2
(config-if-Et2)#traffic-engineering srlg 200
```

Note: Although a large number of SRLGs can be configured on an interface (ranging from 0 to $2^{32} -1$), CSPF only takes into account a maximum of 16 SRLGs for finding a path with SRLG constraints.

### 18.3.2.8 CSPF configuration command

RSVP-TE uses CSPF to compute the FRR backup path. CSPF can be throttled to avoid frequent path changes when there are frequent network events. The following CLI command is used under the router traffic-engineering mode to specify how frequently CSPF is to run after a network event by specifying the initial wait interval, back-off interval, and maximum wait interval for CSPF.

```
cspf delay [initial n back-off n] max n
```

All three values are in milliseconds and default to 100, 200, and 1000 milliseconds, respectively.

### 18.3.2.9 Traffic-engineering Configuration Commands

For CSPF to compute the FRR backup path to a particular destination, enable traffic-engineering on all the IGP enabled interfaces, and enable globally the traffic engineering extensions. For IS-IS, enable under router isis mode, and for OSPFv2, enable under router ospf. This is required for the IGP to start exchanging TE-related attributes with peers and build its topology database.

Also, CSPF needs some notion of router ID to uniquely identify a router, so that it can find a path to it. CSPF also uses self router-id as a source for running SPF. So a router-id is required to be configured under router traffic-engineering mode for CSPF to function properly.

### 18.3.2.10 MTU Signaling

Starting in EOS Release 4.23.1F, MTU along a path can be signaled using RSVP.

**Example**

```
(config-mpls-rsvp)#[no|default]mtu signaling
```

RSVP can discover the lowest MTU used along an LSP by evaluating and updating, at each hop, the composed MTU, stored in the General Parameters fragment of an AdSpec object in RSVP Path messages.

At each RSVP hop, when MTU signaling is enabled, the value is updated by taking the minimum between the downstream interface for an LSP and the composed MTU value from the incoming Path message.

When the feature is disabled, the composed MTU is not updated.

### 18.3.2.11 Soft Preemption

Starting in EOS Release 4.23.1F, soft preemption is supported, which enables deferred failure of RSVP-TE LSPs on link oversubscription. A preemption timer value can be used to configure a delay on a transit router to support LSPs signaled with soft preemption enabled by the headend (RFC 5712).
preemption method [ hard | soft ] timer t
no preemption method [ hard | soft ] timer t
default preemption method [ hard | soft ] timer t

The default preemption method is soft preemption with a timer value of 30 seconds.
In this example, the preemption method is soft preemption with a timer value of 10 seconds.

(config-mpls-rsvp)# preemption method soft timer 10

Setting the preemption method to hard preemption results in a timer value of 0 seconds and disables the feature.

(config-mpls-rsvp)# preemption method hard

Sample Configuration

switch(config)# ip routing
switch(config)# mpls ip
switch(config)# interface Ethernet1
switch(config-if-Et1)# no switchport
switch(config-if-Et1)# ip address 10.0.0.1/24
switch(config-if-Et1)# isis enable isis
switch(config-if-Et1)# traffic-engineering
switch(config-if-Et1)# traffic-engineering bandwidth 100 percent
switch(config-if-Et1)# traffic-engineering metric 5
switch(config)# router traffic-engineering
switch(config-te)# router-id ipv4 0.1.1.1
switch(config-router-isis)# net 49.0000.0000.0000.1111.00
switch(config-router-isis)# is-type level-2
switch(config-router-isis)# address-family ipv4 unicast
switch(config-router-isis-af)# maximum-paths 32
switch(config-router-isis-af-te)# traffic-engineering
switch(config-router-isis-af-te)# no shutdown
switch(config-router-isis-af-te)# is-type level-2
switch(config)# mpls rsvp
switch(config-mpls-rsvp)# no shutdown

The following displays the overall state of RSVP.

switch> show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
Mode: none
Hierarchical FECs: enabled
Cycryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
  Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
  Operational: 1
  Ingress/Transit/Egress: 0/1/0
Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2

The following displays the RSVP neighbors.

```
switch> show mpls rsvp neighbor
Neighbor 10.0.1.1
  Upstream for
  Session #1 LSP #1
  Downstream for
  Neighbor uptime: 00:01:24
  Authentication type: disabled
  Last hello received: 1 seconds ago
  Last hello sent: 1 seconds ago
  Bypass tunnel: not requested
Neighbor 10.0.2.2
  Upstream for
  Downstream for
  Session #1 LSP #1
  Neighbor uptime: 00:01:24
  Authentication type: disabled
  Last hello received: -
  Last hello sent: 31 seconds ago

      0
    Ethernet2  13     0         0         0         0        0        0        4
```

**18.3.2.12  Show Commands**
18.3.2.12.1 RSVP Show Commands

Use the `show mpls rsvp` command to display the overall state of the RSVP.

```plaintext
switch>show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
Hello messages: enabled
   Hello interval: 10 seconds
   Hello multiplier: 4
Fast Re-Route: disabled
Mode: none
Hierarchical FECs: enabled
Cryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
   Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
   Operational: 1
   Ingress/Transit/Egress: 0/1/0
Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2
```

Use the `show mpls rsvp neighbor` command to display RSVP neighbors.

```plaintext
switch>show mpls rsvp neighbor
Neighbor 10.0.1.1
   Upstream for
      Session #1 LSP #1
   Downstream for
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: 1 seconds ago
   Last hello sent: 1 seconds ago
   Bypass tunnel: not requested
Neighbor 10.0.2.2
   Upstream for
   Downstream for
      Session #1 LSP #1
   Neighbor uptime: 00:01:24
   Authentication type: disabled
   Last hello received: -
   Last hello sent: 31 seconds ago
   Bypass tunnel: not requested
```

Use the `show mpls rsvp neighbor summary` command to display neighbors filtered by IP address.

```plaintext
switch>show mpls rsvp neighbor summary
Neighbor     Role     Sessions LSPs
============= ========== ======= ========
10.0.1.1     Upstream  1     1
10.0.2.2     Downstream 1     1
```

or use the `show mpls rsvp session` command.

```plaintext
switch>show mpls rsvp session
Session #1
```
Destination address: 0.4.4.4
Tunnel ID: 0
Extended Tunnel ID: 0.1.1.1
Role: transit
LSP #1
  State: up
  Type: primary
  Source address: 0.1.1.1
  LSP ID: 1
  LSP uptime: 00:02:38
  Session name: Session1
  Local label: 100000
  Downstream label: 100000
  Upstream neighbor: 10.0.1.1
    Last refresh received: 17 seconds ago
    Last refresh sent: 10 seconds ago
  Downstream neighbor: 10.0.2.2
    Last refresh received: 7 seconds ago
    Last refresh sent: 9 seconds ago
  Bypass tunnel: not requested

Session #ID and LSP #ID are internal values that are locally significant. Use these to filter sessions in the `show mpls rsvp session summary` command and in LSP ping and traceroute commands (see below). Sessions can further be filtered by name, destination, router role (transit/ingress/egress), and state.

```
session>
```

```
switch>
```

```
beginning with EOS Release 4.23.1F, use the `show mpls rsvp session detail` command to display detailed information of RSVP sessions.

```
switch>
```

```
use the `show mpls rsvp counters` command to display RSVP message counters by interface.

```
switch>
```

18.3.2.12.2 CSPF Show Commands

RSVP-TE uses CSPF to compute the FRR backup path. Starting from EOS Release 4.23.1F, if srlg is configured in RSVPconfig to exclude SRLG, then details about the SRLG related constraint attributes are also shown as in the following show commands.

Use the `show traffic-engineering cspf path` command to display all the paths computed by CSPF. In the following example, path 20.0.0.1 is selected for display.

```
switch>show traffic-engineering cspf path 20.0.0.1 20.0.0.1
```

<table>
<thead>
<tr>
<th>Destination</th>
<th>Constraint</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>20.0.0.1</td>
<td>exclude Ethernet1</td>
<td>0.1.1.1</td>
</tr>
<tr>
<td></td>
<td>exclude SRLG of Ethernet1</td>
<td>0.1.1.2</td>
</tr>
<tr>
<td></td>
<td>exclude Ethernet2</td>
<td>0.1.1.1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0.1.1.2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0.2.2.2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3.3.3.2</td>
</tr>
</tbody>
</table>

Using the `show traffic-engineering cspf path detail` command, path 20.0.0.1 is displayed in detail.

```
switch>show traffic-engineering cspf path 20.0.0.1 detail
```

<table>
<thead>
<tr>
<th>Destination: 20.0.0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path Constraint: exclude Ethernet1</td>
</tr>
<tr>
<td>exclude SRLG of Ethernet1: orange-link (500), green-link (400), 100, red-link (200), 600</td>
</tr>
<tr>

0.1.1.1 |
```
18.3.2.12.2 Displaying the Traffic-engineering Database

You can display the topology used for CSPF computations by using the show traffic-engineering database command. Starting from EOS Release 4.23.1F, the SRLG group details of a neighbor are shown if it is advertised.

Beginning with EOS Release 4.24.2F, information for the OSPFv2 topology, if configured, displays.

```
switch#show traffic-engineering database

18.3.2.13 Limitations

RSVP-TE LSR contains the following limitations:

- Supports only IPv4.
- Supports only the default VRF.
- Supports only strict EROs with host hops (/32).
- Supports only transit role functionality.
- Traffic Engineering links with secondary IP addresses are not supported.
- The maximum number of supported RSVP sessions and LSPs is 5000.
- For FRR, the maximum number of supported LSPs per interface is 2000.
- Changing the RSVP FRR mode while a bypass tunnel is already in use can bring down both primary and bypass tunnels which cause traffic loss.
- Changing the RSVP SRLG mode while a bypass tunnel is already in use could bring down both primary and bypass tunnels which cause traffic loss.
- The maximum number of IS-IS/OSPFv2 routers supported by CSPF on a single broadcast network is 30.
- The maximum number of IS-IS/OSPFv2 adjacencies supported by CSPF for a single router is 500.
- CSPF only takes into account a maximum of 16 SRLGs per TE link, when excluding SRLGs while computing a path.

18.4 LDP Pseudowire

LDP pseudowire provides support for emulating Ethernet connections over a Multiprotocol Label Switching (MPLS) network, and controlled using the extension of the MPLS Label Distribution Protocol (LDP) specified in RFC4447.

The `patch panel` command allows “patching” a local interface “connector” to an LDP pseudowire “connector”, terminating on the local switch. The LDP pseudowire itself is defined under the `pseudowires` configuration mode, under the `mpls ldp` configuration mode.

LDP pseudowire also supports locally patching traffic between two interfaces and is configured under the `patch panel` command.

Both these features support tagged (type 4) and raw (type 5) modes as highlighted in https://tools.ietf.org/html/rfc4448.

18.4.1 Platform Compatibility

The following platforms support LDP Pseudowire:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Ethernet Tagged Mode (type 4)</th>
<th>Ethernet Raw Mode (type 5)</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCS-7500R</td>
<td>EOS Release 4.17.1</td>
<td>EOS Release 4.20.1</td>
</tr>
<tr>
<td>DCS-7280R</td>
<td>EOS Release 4.17.1</td>
<td>EOS Release 4.20.1</td>
</tr>
<tr>
<td>DCS-7500R2</td>
<td>EOS Release 4.18.4</td>
<td>EOS Release 4.20.1</td>
</tr>
<tr>
<td>DCS-7280R2</td>
<td>EOS Release 4.18.4</td>
<td>EOS Release 4.20.1</td>
</tr>
<tr>
<td>DCS-7020R</td>
<td>EOS Release 4.22.0</td>
<td>EOS Release 4.22.0</td>
</tr>
</tbody>
</table>
18.4.2 Configurations

18.4.2.1 Local-Remote Patch Configuration

To configure an LDP pseudowire, complete the following task.

1. Enter the pseudowire configuration section under the mpls ldp configuration section, and specify an LDP pseudowire name using the pseudowire command. In this example, the selected LDP pseudowire name is ldppw.

```plaintext
switch(config)#mpls ldp
switch(config-mpls-ldp)#pseudowire
switch(config-mpls-ldp-pw)#pseudowire ldppw
```

2. Once an LDP pseudowire has been configured, configure the neighbor IP address, pseudowire ID, and pseudowire MTU using the neighbor, pseudowire-id, and mtu configuration commands.

```plaintext
switch(config-mpls-ldp-pw-ldppw)#neighbor 1.2.3.4
switch(config-mpls-ldp-pw-ldppw)#pseudowire-id 1
switch(config-mpls-ldp-pw-ldppw)#mtu 9000
```

3. To configure a cross-connection between two connectors, configure a pseudowire patch by specifying a patch name in the patch panel configuration section.

```plaintext
switch(config)#patch panel
switch(config-patch)#patch example
```

4. After entering a patch configuration mode, configure a type 4 LDP pseudowire by specifying a VLAN tagged interface connector and an LDP pseudowire connector using the connector command.

```plaintext
switch(config-patch-example)#connector interface ethernet1 dot1q vlan 100
switch(config-patch-example)#connector pseudowire ldp ldppw
```

5. After entering a patch configuration mode, configure a type 5 LDP pseudowire by specifying an interface connector and an LDP pseudowire connector using the connector command.

```plaintext
switch(config-patch-example)#connector interface ethernet1
switch(config-patch-example)#connector pseudowire ldp ldppw
```

Note: IP routing must be enabled and the interface used for the local connector must be routed.

```plaintext
switch(config)#ip routing
switch(config)#interface ethernet1
switch(config-if-Et1)#no switchport
```

18.4.2.2 Local-Local Patch Configuration

The patch can also consist of two interface connectors or two VLAN tagged interface connectors to configure local stitching.

```plaintext
switch(config-patch)#patch example
switch(config-patch-example)#connector conn1 ethernet1
switch(config-patch-example)#connector conn2 ethernet2
switch(config-patch)#patch example2
switch(config-patch-example2)#connector conn1 ethernet1 dot1q vlan 100
```
Note: IP routing must be enabled and both interfaces used for the local connectors must be routed.

```
switch(config)#ip routing
switch(config)#interface ethernet1
switch(config-if-Et1)#no switchport
switch(config)#interface ethernet2
switch(config-if-Et2)#no switchport
```

### 18.4.2.3 Additional Patch Configuration Commands

The `shutdown` configuration command can be used to disable a pseudowire patch.

**Example**

```
switch(config-patch-example)#shutdown
```

### 18.4.2.4 Forwarding Behavior For Layer 2 Control Packets

There are differences in forwarding behavior for reserved MACs between the Ethernet Tagged Mode and the Ethernet Raw Mode. Some Layer 2 control packets are terminated and consumed at the Provider Edge, while others are encapsulated and forwarded on the pseudowire. Below is a list of the common Layer 2 control packets, and a summary of their forwarding behavior.

<table>
<thead>
<tr>
<th></th>
<th>Ethernet Tagged Mode (type 4)</th>
<th>Ethernet Raw Mode (type 5)</th>
</tr>
</thead>
<tbody>
<tr>
<td>STP</td>
<td>When STP is enabled, STP packets are terminated. Otherwise, they are forwarded.</td>
<td>Forwarded</td>
</tr>
<tr>
<td>LLDP</td>
<td>Terminated</td>
<td>Forwarded</td>
</tr>
<tr>
<td>LACP</td>
<td>Terminated</td>
<td>Terminated</td>
</tr>
<tr>
<td>MACsec</td>
<td>Not supported</td>
<td>Forwarded</td>
</tr>
</tbody>
</table>

In addition, custom Layer 2 Control Packet forwarding behavior for type 5 pseudowire can be configured using the Layer 2 Protocol Forwarding functionality.

### 18.4.3 Show Commands

Use the `show patch panel` command to display the overall status of the configured pseudowire patches.

**Example**

```
switch#show patch panel
Patch    Connector                        Status
--------- ------------------------------------ ---------
example  1: Ethernet3                     Up         
          2: Port-Channel2
example2 1: Ethernet1 802.1Q VLAN 100     Up         
          2: LDP neighbor 1.1.1.1 PW ID 1111
```
Use the `show patch panel detail` command to display the detailed status of the configured pseudowire patches.

### Example

```
switch#show patch panel detail
```

**PW Fault Legend:**
- ET-IN - Ethernet receive fault
- ET-OUT - Ethernet transmit fault
- TUN-IN - Tunnel receive fault
- TUN-OUT - Tunnel transmit fault
- NF - Pseudowire not forwarding (other reason)

**Patch: example**
- **Connector 1:** Ethernet3
  - Status: Up
- **Connector 2:** Port-Channel12
  - Status: Up

**Patch: example2**
- **Connector 1:** Ethernet1 802.1Q VLAN 100
  - Status: Up
- **Connector 2:** LDP neighbor 1.1.1.1 PW ID 1111
  - Status: Up
  - Local MPLS label: 100032, Group ID: 0
  - MTU: 9000, 802.1Q VLAN request sent: -
  - Neighbor MPLS label: 900000, Group ID: 0x0
  - MTU: 9000, 802.1Q VLAN request received: -
  - PW type: 4 (tagged), Control word: N
  - Tunnel type: LDP, Tunnel index: 198

**Patch: example3**
- **Connector 1:** LDP neighbor 4.4.4.4 PW ID 1040
  - Status: Up
  - Local MPLS label: 100002, Group ID: 0x0
  - MTU: 1500, 802.1Q VLAN request sent: -
  - Neighbor MPLS label: 400000, Group ID: 0x0
  - MTU: 9213, 802.1Q VLAN request received: -
  - PW type: 5 (raw), Control word: N
  - Tunnel type: LDP, Tunnel index: 2

**Connector 2:** Ethernet2
- Status: Up

Use the `show patch panel forwarding` command to display the forwarding information for configured pseudowire connectors.

### Example

```
switch#show patch panel forwarding
```

**Legend:**
- **Type** - Pseudowire type: 4 (tagged) 5 (raw)
- **CW** - Control word used

<table>
<thead>
<tr>
<th>In/Out</th>
<th>Type</th>
<th>CW</th>
<th>VLAN</th>
<th>Status</th>
<th>Patch</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et1 802.1Q VLAN 100</td>
<td>4</td>
<td>Up</td>
<td></td>
<td></td>
<td>example2</td>
</tr>
</tbody>
</table>
18.4.4 Limitations

When a subinterface has been configured with the same VLAN tag as a pseudowire connector on the same parent interface, or vice versa, only the first configured feature will be active.

When a port-based connector is used for a pseudowire or local cross-connect patch, dot1q-tagged packets will have the outer tag incorrectly removed on ingress/encap if any one of several other features are configured on the switch (on any interface) including Layer 2 subinterfaces, Dot1q Tunnel, VLAN Mapping, and VXLAN. The only workaround is to unconfigure these other features.

When a VLAN-based connector (or subinterface with dot1q encapsulation) is used for a pseudowire or local cross-connect patch, tagged packets will have incorrect tags after forwarding if any one of several other features are configured on the switch (on any interface) including Layer 2 subinterfaces, Dot1q Tunnel, VLAN Mapping, and VXLAN. The only workaround is to unconfigure these other features.
18.5 **MPLS Commands**

**MPLS Commands**

- **MPLS Commands**
  - mpls ip
  - mpls static
  - mpls static vrf-label
  - mpls tunnel termination
  - show mpls route
  - show mpls route summary
- **RSVP-TE LSR**
  - authentication
  - cspf delay
  - fast-reroute
  - fast-reroute reversion
  - ping mpls rsvp session
  - preemption method
  - shutdown
  - srlg
- **RSVP-TE LSR Show Commands**
  - show mpls rsvp counters
  - show mpls rsvp neighbor
  - show mpls rsvp session detail
  - show mpls rsvp session summary
  - show mpls rsvp session
  - show mpls rsvp
  - show traffic-engineering cspf path
  - show traffic-engineering database
18.5.1 authentication

Use the authentication command to enable cryptographic authentication. The no form and the default form of the command removes cryptographic authentication.

Command Mode

MPLS RSVP sub-mode (mpls-rsvp)

Command Syntax

```markdown
authentication [ index 1-4294967295 [ active | password ] | [ sequence-number window 1-255 ] | [ type [ md5 | none ] ] ]

no authentication [ index 1-4294967295 [ active | password ] | [ sequence-number window 1-255 ] | [ type [ md5 | none ] ] ]

default authentication [ index 1-4294967295 [ active | password ] | [ sequence-number window 1-255 ] | [ type [ md5 | none ] ] ]
```

Parameters

- **index 1-4294967295** Password index.
  - **active** Use index as the active password.
  - **password** password.

- **sequence-number** Index in the sequence.
  - **window 1-255** Reorder window size. The default value is 5. A value of 1 turns off support for packet reordering.

- **type** Authentication mechanism.
  - **md5** MD5 hash.
  - **none** No authentication mechanism. Disables cryptographic authentication.

Examples

- Cryptographic Authentication (RFC 2747) is enabled by setting the authentication type to md5 and configuring an active password.

  ```markdown
  (config-mpls-rsvp)#authentication type md5
  ```

- Authentication secrets are configured with an index. One of the indices should be chosen as the actively used password:

  ```markdown
  (config-mpls-rsvp)#authentication index 1 password s3cr3t
  (config-mpls-rsvp)#authentication index 1 active
  ```

  The active password is used to authenticate outgoing messages. All configured passwords are accepted for authentication of incoming packets, which allows smooth key rollover.

- Password obfuscation is available:

  ```markdown
  (config-mpls-rsvp)#authentication index 1 password 7 07092E43
  ```

- The size of the sequence number reorder window can be changed to accommodate a larger number of out-of-order packets. A value of \( N \) means that a packet is accepted if all earlier received packets with a higher sequence number are within the preceding \( N-1 \) packets.

  ```markdown
  (config-mpls-rsvp)#authentication sequence-number window 5
  ```

  The default value is 5. A value of 1 effectively turns off support for packet reordering.
18.5.2 cspf delay

RSVP-TE uses CSPF to compute the FRR backup path. CSPF can be throttled to avoid frequent path changes when there are frequent network events. Use the `cspf delay` command to specify how frequently CSPF is to run after a network event by specifying the initial wait interval, back-off interval, and maximum wait interval for CSPF. The `no` form and the `default` form of the command removes the CSPF delay.

**Command Mode**

Router traffic engineering mode

**Command Syntax**

```
cspf delay [initial n back-off n] max n
no cspf delay [initial n back-off n] max n
default cspf delay [initial n back-off n] max n
```

**Parameters**

- **initial** Specify initial wait interval for CSPF.
  - `n` Time in milliseconds. 1-300000.
- **back-off** specify back-off interval for CSPF.
  - `n` Time in milliseconds. 1-300000.
- **max** Specify maximum wait interval for CSPF.
  - `n` Time in milliseconds. 1-300000.
18.5.3 fast-reroute

Use the fast-reroute command to support Fast Reroute (FRR) link protection/NHOP (RFC 4090). You can enable FRR protection by setting the Fast Reroute mode to link-protection.

Command Mode
MPLS RSVP sub-mode (mpls-rsvp)

Command Syntax
fast-reroute [mode [ link-protection | node-protection | none ] | [ reversion [ global | local ]]

Parameters
- **mode** Fast reroute mode.
  - **link-protection** Protects against failure of the next link.
  - **node-protection** Protects against failure of the next node.
  - **none** Disables fast reroute.
- **reversion** Select reversion behavior.
  - **global** Global revertive repair (default).
  - **local** Local revertive repair.

Examples
- Support for Fast Reroute (FRR) link protection/NHOP (RFC 4090) is enabled by setting the Fast Reroute mode to link-protection.

  ```
  (config-mpls-rsvp)#fast-reroute mode link-protection
  ```

- To turn off FRR, change the mode to the default setting none.

  ```
  (config-mpls-rsvp)#fast-reroute mode none
  ```

- You can change the revertive behavior of the FRR from the **global** revertive mode to the **local** revertive mode. In the global revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is down keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the **local** revertive mode, the LSR switches back to using the primary link after recovery.

  ```
  (config-mpls-rsvp)#fast-reroute reversion local
  ```

- The default for reversion is **global**.

  ```
  (config-mpls-rsvp)#fast-reroute reversion global
  ```
18.5.4 fast-reroute reversion

You can change the revertive behavior of the FRR from the global revertive mode to the local revertive mode. In the global revertive mode, an LSR that is re-routed over a bypass tunnel because its downstream link is dead keeps using the bypass tunnel even after the link has recovered. This expects the headend router to set up a new LSP upon notification that a link is not available anymore. In the local revertive mode, the LSR switches back to using the primary link after recovery.

The default for reversion is global.

**Command Mode**
Configuration sub-mode for RSVP

**Command syntax**
fast-reroute reversion [ global | local ]

**Parameters**
- **global** Global revertive repair.
- **local** Local revertive repair.

**Examples**
- Setting the fast-reroute reversion to local:

  (config-mpls-rsvp)#fast-reroute reversion local

- The default for reversion is global.

  (config-mpls-rsvp)#fast-reroute reversion global
18.5.5  hello interval

The hello interval command sets the time between the hello packets. The no form of the command explicitly disables the Hello messages, while the default form of the command resets to the default setting of 10 seconds with a multiplier of 4.

Command Mode
Configuration sub-mode for RSVP.

Command Syntax

hello interval [interval [sec]] [multiplier [num]]

no hello interval [interval [sec]] [multiplier [num]]

default hello interval [interval [sec]] [multiplier [num]]

Parameters

- interval sec The interval in units of seconds.
- multiplier num The number of missed hellos after which the neighbor is expired.

Examples

- In this example, hello messages are sent to all known neighbors every 10 seconds. If no hello responses are received from a neighbor for 4*10=40 seconds, communication is considered to be lost and the neighbor is reset.

  (config-mpls-rsvp)#hello interval 10 multiplier 4

- In this example, the default of 10 seconds with multiplier 4 is reset.

  (config-mpls-rsvp)#default hello interval

- In this example, the command to explicitly disables the Hello messages.

  (config-mpls-rsvp)#no hello interval
18.5.6  mpls ip

The mpls ip command enables MPLS routing. Multiprotocol Label Switching (MPLS) is a networking process that avoids complex lookups in a routing table by replacing complete network addresses with short path labels for directing data packets to network nodes. MPLS data paths are serviced through a tunnel encapsulation data structure that adds four-byte label headers to packets.

The no mpls ip and default mpls ip commands disable MPLS routing by removing the mpls ip command from running-config. When MPLS routing is disabled, routed MPLS packets are dropped and all MPLS routes and adjacencies are removed. MPLS routing is disabled by default.

Command Mode
Global Configuration

Command Syntax

mpls ip
no mpls ip
default mpls ip

Examples:

• This command enables MPLS routing. Previous commands enabled IP routing and configured MPLS static routes.

```bash
switch(config)#mpls ip
switch(config)#show running-config

! Command: show running-config
!
! ip routing
! mpls ip
! mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!
! end
switch(config)#
```

• This command disables MPLS routing.

```bash
switch(config)#no mpls ip
switch(config)#show running-config

! Command: show running-config
<--------OUTPUT OMITTED FROM EXAMPLE-------->
!
! ip routing
mpls static top-label 3400 10.14.4.4 pop payload-type ipv4
mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
!
! end
switch(config)#
```
18.5.7 mpls static

The *mpls static* command creates an MPLS rule that specifies the method of handling of inbound MPLS traffic. Multiprotocol Label Switching (MPLS) is a networking process that replaces complete network addresses with short path labels for directing data packets to network nodes.

Static rules specify these parameters:

- **MPLS filter**: The top-label parameter specifies the 20-bit value that the MPLS packet’s top header label must match to be handled by the rule.
- **Nexthop location**: Specifies the destination nexthop address (IPv4 or IPv6) and the interface through which the switch forwards the packet.
- **MPLS action**: Specifies the MPLS label stack management action performed on the packet:
  - pop-payload: removes the top label from stack; this terminates an LSP (label-switched path).
  - swap-label: replaces top label with a specified new label; this passes a packet along an LSP.
- **Rule priority**: Specifies the rule to be used when an MPLS packet matches multiple rules.

The *no mpls static* and *default mpls static* commands delete the specified MPLS rule from *running-config*.

- Commands that include only a top label tag remove all MPLS rules with the matching top label.
- Commands with no **PRIORITY** parameter remove all matching routes of every metric value.

**Command Mode**

Global Configuration

**Command Syntax**

```
mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
no mpls static top-label top_tag
no mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
default mpls static top-label top_tag
default mpls static top-label top_tag [DEST_INTF] NEXTHOP_ADDR ACTION [PRIORITY]
```

**Parameters**

- **top_tag**  Top header’s label field contents. Value ranges from 0 to 1048575 (20 bits).
- **DEST_INTF** Specifies interface through which **NEXTHOP_ADDR** is accessed. Options include:
  - `<no parameter>`       Any interface.
  - ethernet e_num        Ethernet interface specified by e_num.
  - loopback l_num        Loopback interface specified by l_num.
  - management m_num      Management interface specified by m_num.
  - port-channel p_num    Port-channel interface specified by p_num.
  - vlan v_num            VLAN interface specified by v_num.
  - vxlan vx_num          VXLAN interface specified by vx_num.
- **NEXTHOP_ADDR**      Nexthop address for MPLS for filtered MPLS packets. Options include:
  - ipv4_addr             IPv4 address.
  - ipv6_addr             IPv6 address.
- **ACTION** MPLS header stack management action performed on packet. Options include:
  - pop payload-type ipv4 Removes top layer from stack. Payload is handled as IPv4 packet.
  - pop payload-type ipv6 Removes top layer from stack. Payload is handled as IPv6 packet.
  - swap-label <0 to 1048575> Replaces header label with specified label value (20 bits).
  - PRIORITY              Specifies rule priority when multiple rules match a packet. Options include:
• `<no parameter>` Assigns a metric value of 100 to the rule.
• `metric <1 to 255>` Lower values denote higher priority. Value ranges from 1 to 255.

The `mpls static` command does not support push label actions.

Examples:

• These commands create an MPLS rule that matches packets with a top label value of 3400 and causes the removal of the top label from the header stack. The nexthop destination of the IPv4 payload is IP address 10.14.4.4 through Ethernet interface 3/3/3. This rule has a metric value of 100.

```
switch(config)#mpls static top-label 3400 ethernet 3/3/3 10.14.4.4 pop
payload-type ipv4
switch(config)#show running-config
!
mlps static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
ipv4
!
end
switch(config)#
```

• These commands create a backup rule that forwards the packet through Ethernet interface 4/3. This rule’s metric value of 150 assigns it backup status prior to the first rule.

```
switch(config)#mpls static top-label 3400 ethernet 4/3 10.14.4.4 pop
payload-type ipv4 metric 150
switch(config)#show running-config
!
mlps static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
metric 150
mlps static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type
ipv4
!
<--------OUTPUT OMITTED FROM EXAMPLE-------->
end
switch(config)#
```

• These commands create an MPLS rule that forwards the packet to the nexthop address through any interface.

```
switch(config)#mpls static top-label 4400 10.15.46.45 pop payload-type ipv4
switch(config)#show running-config

<--------OUTPUT OMITTED FROM EXAMPLE-------->
!
mlps static top-label 3400 Ethernet4/3 10.14.4.4 pop payload-type ipv4
metric 150
mlps static top-label 3400 Ethernet3/3/3 10.14.4.4 pop payload-type ipv4
mlps static top-label 4400 10.15.46.45 pop payload-type ipv4
!
end
```
switch(config)#
18.5.8  **mpls static vrf-label**

Use the `mpls static vrf-label` command to configure a static VRF label route. The `no` and `default` versions of the command removes the configuration.

**Command Mode**
Global configuration mode

**Command Syntax**

```
mpls static vrf-label mpls-label [ vrf vrf-name ]
no mpls static vrf-label mpls-label [ vrf vrf-name ]
default mpls static vrf-label mpls-label [ vrf vrf-name ]
```

**Parameters**

- `mpls-label` Value of the MPLS label.
- `vrf vrf-name` VRF instance name.

**Example**

```
switch(config)# mpls static vrf-label 100 vrf default
switch(config)# mpls static vrf-label 200 vrf v1
```
18.5.9  mpls tunnel termination

Command Mode
Global configuration mode

Command Syntax
mpls tunnel termination [ model [ php model ] [ ttl [ pipe | uniform ] dscp ] | pipe | uniform ]
no mpls tunnel termination [ model [ php model ] [ ttl [ pipe | uniform ] dscp ] | pipe | uniform ]
default mpls tunnel termination [ model [ php model ] [ ttl [ pipe | uniform ] dscp ] | pipe | uniform ]

Parameters
- **model** Tunnel termination TTL and DSCP model.
- **php** Penultimate hop popping configuration.
- **ttl** Model for TTL.
- **pipe** Preserve the inner value.
- **uniform** Propagate value from outer header.
- **dscp** mode for DSCP.

Example

```
switch(config)# mpls tunnel termination model ttl uniform dscp pipe
```
18.5.10 ping mpls rsvp session

LSP Ping allows the user to check if the remote endpoint of an RSVP session is reachable through the LSP. Running ping on an RSVP LSP creates an LSP Ping Request packet with the label programmed by RSVP and that packet will follow the MPLS path until it reaches the end of the tunnel. If the node that receives this Request is the intended destination, it replies with an RSVP Ping Reply through normal IP routing. When the source receives the Reply it indicates that there are no apparent data plane failures and that the endpoint of that LSP is reachable.

Command Mode
Configuration sub-mode for RSVP

Command Syntax
ping mpls rsvp session [id num | name word] [ lsp | pad-reply | repeat | source | standard | tos | tos]

Parameters
• id Specifies the session by ID
  • num RSVP session ID.
  • lsp Specifies LSP
  • pad-reply Indicates that the reply should copy the pad TLV.
  • repeat Specifies repeat count.
  • source Specifies source address.
  • standard Sets the standard to comply with.
  • tos Specifies ToS value.
  • traffic-class Specifies MPLS traffic class field.
• name Specifies session by name.
  • word RSVP session name.
    • lsp Specifies LSP
    • pad-reply Indicates that the reply should copy the pad TLV.
    • repeat Specifies repeat count.
    • source Specifies source address.
    • standard Sets the standard to comply with.
    • tos Specifies ToS value.
    • traffic-class Specifies MPLS traffic class field.

Examples
• A user can invoke the ping utility for a specific LSP by using the session and LSP IDs displayed in the CLI show commands.

```
switch#ping mpls rsvp session id 1 lsp 1 repeat 3
LSP ping to RSVP session #1 LSP #1
  timeout is 5000ms, interval is 1000ms
Via 10.0.12.2, Ethernet1, label 100000
  Reply from 10.0.34.4: seq=1, time=53.294ms, success: egress ok
Via 10.0.12.2, Ethernet1, label 100000
  Reply from 10.0.34.4: seq=2, time=75.329ms, success: egress ok
Via 10.0.12.2, Ethernet1, label 100000
  Reply from 10.0.34.4: seq=3, time=85.574ms, success: egress ok
--- RSVP target fec 0.4.4.4 : lspping statistics ---
Via 10.0.12.2, Ethernet1, label 100000
  3 packets transmitted, 3 received, 0% packet loss, time 2272ms
  3 received from 10.0.34.4, rtt min/max/avg 53.294/85.574/71.399 ms
```
For the `ping mpls rsvp session` command, the argument `lsp` is optional. If unspecified, the utility pings all LSPs within that session.

```
switch#ping mpls rsvp session id 1 repeat 2
LSP ping to RSVP session #1
  timeout is 5000ms, interval is 1000ms
LSP 1
  Via 10.0.12.2, Ethernet1, label 100000
    Reply from 10.0.34.4: seq=1, time=60.28ms, success: egress ok
LSP 2
  Via 10.0.12.2, Ethernet1, label 100002
    Reply from 10.0.34.4: seq=1, time=81.701ms, success: egress ok
LSP 1
  Via 10.0.12.2, Ethernet1, label 100000
    Reply from 10.0.34.4: seq=2, time=52.807ms, success: egress ok
LSP 2
  Via 10.0.12.2, Ethernet1, label 100002
    Reply from 10.0.34.4: seq=2, time=62.814ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lsp ping statistics ---
LSP 1
  Via 10.0.12.2, Ethernet1, label 100000
    2 packets transmitted, 2 received, 0% packet loss, time 1262ms
    2 received from 10.0.34.4, rtt min/max/avg 52.807/60.280/56.544 ms
LSP 2
  Via 10.0.12.2, Ethernet1, label 100002
    2 packets transmitted, 2 received, 0% packet loss, time 1262ms
    2 received from 10.0.34.4, rtt min/max/avg 62.814/81.701/72.257 ms
```

Similarly, the session can be specified by name and the utility pings all the LSPs within that session.

```
switch#ping mpls rsvp session name Session1to4 repeat 2
LSP ping to session Session1to4
  timeout is 5000ms, interval is 1000ms
LSP 1
  Via 10.0.12.2, Ethernet1, label 100000
    Reply from 10.0.34.4: seq=1, time=63.314ms, success: egress ok
LSP 2
  Via 10.0.12.2, Ethernet1, label 100002
    Reply from 10.0.34.4: seq=1, time=75.639ms, success: egress ok
LSP 1
  Via 10.0.12.2, Ethernet1, label 100000
    Reply from 10.0.34.4: seq=2, time=60.875ms, success: egress ok
LSP 2
  Via 10.0.12.2, Ethernet1, label 100002
    Reply from 10.0.34.4: seq=2, time=77.135ms, success: egress ok

--- RSVP target fec 0.4.4.4 : lsp ping statistics ---
LSP 1
  Via 10.0.12.2, Ethernet1, label 100000
    2 packets transmitted, 2 received, 0% packet loss, time 1262ms
    2 received from 10.0.34.4, rtt min/max/avg 60.875/63.314/62.094 ms
LSP 2
  Via 10.0.12.2, Ethernet1, label 100002
    2 packets transmitted, 2 received, 0% packet loss, time 1262ms
    2 received from 10.0.34.4, rtt min/max/avg 75.639/77.135/76.387 ms
```
18.5.11 preemption method

The preemption method command enables deferred failure of RSVP-TE LSPs on link oversubscription. Use a preemption timer value to configure a delay on a transit router to support LSPs signaled with soft preemption enabled by the headend (RFC 5712).

The default preemption method is soft preemption with a timer value of 30 seconds.

Command Mode
Configuration sub-mode for RSVP

Command Syntax
preemption method [ hard | soft ] timer t
no preemption method [ hard | soft ] timer t
default preemption method [ hard | soft ] timer t

Parameters
• hard Hard preemption.
• soft Soft preemption.
  • timer Time limit for LSP teardown.
    • t <1-65535> Timer value in units of seconds.

Example
• In this example, the preemption method is soft preemption with a timer value of 10 seconds.
  (config-mpls-rsvp)#preemption method soft timer 10

• Setting the preemption method to hard preemption results in a timer value of 0 seconds and disables the feature.
  (config-mpls-rsvp)#preemption method hard
18.5.12 refresh method

Using the `refresh method` command with the `bundled` keyword enables the Refresh Overhead Reduction that supports the sending of message IDs and refreshing state with refresh messages.

**Command Mode**
Configuration sub-mode for RSVP

**Command Syntax**
```
refresh method [bundled | explicit]
```

**Parameters**
- **bundled** Refresh states using message identifiers lists. This is the default setting.
- **explicit** Send each message individually.

**Examples**
- Use the `bundled` keyword to enable the Refresh Overhead Reduction.
  ```
  (config-mpls-rsvp)#refresh method bundled
  ```
- To turn off refresh overhead reduction, use the `explicit` keyword.
  ```
  (config-mpls-rsvp)#refresh method explicit
  ```
18.5.13 show mpls route summary

The `show mpls route summary` command displays statistics about the configuration and implementation of MPLS rules.

**Command Mode**
EXEC

**Command Syntax**

`show mpls route summary`

**Example:**

This command displays a summary of MPLS rule implementation.

```
switch>show mpls route summary
Number of Labels: 1 (1 unprogrammed)
Number of adjacencies in hardware: 0
Number of backup adjacencies: 2
switch>
```
18.5.14 show mpls route

The `show mpls config route` command displays the switch’s MPLS static rule configuration for the specified routes and rules.

**Command Mode**

EXEC

**Command Syntax**

`show mpls [INFO_LEVEL] route [header_label]`

**Parameters**

- **INFO_LEVEL** Specifies the filters that are used to select the routes to display. Options include:
  - `<no parameter>` Displays routes published by the forwarding agent.
  - `config` Displays all configured routes.
  - `lfib` Displays routes stored to the Label Forwarding Information Base (LFIB).
- **header_label** Filters routes by MPLS top header label. Options include:
  - `<no parameter>` Displays routes for all header values.
  - `<0 to 1048575>` Specifies header for which command displays information.

**Example:**

This command displays the MPLS rule configuration.

```
switch>show mpls config route
In-Label Out-Label Metric Payload NextHop
3400 pop 100 ipv4 10.14.4.4,Et3/3/3
3400 pop 150 ipv4 10.14.4.4,Et4/3
switch>
```
18.5.15  show mpls rsvp

Use the `show mpls rsvp` to display the overall state of the RSVP.

**Command Mode**

EXEC

**Command Syntax**

```
show mpls rsvp [ bandwidth | counters | ip | ipv6 | neighbor | session ]
```

**Parameters**

- **bandwidth** Displays RSVP bandwidth information.
- **counters** Displays RSVP message counters.
- **ip** Displays details related to IPv4.
- **ipv6** Displays details related to IPv6.
- **neighbor** Displays RSVP neighbors.
- **session** Displays RSVP session information.

**Examples**

```
switch>show mpls rsvp
Administrative state: enabled
Operational state: up
Refresh interval: 30 seconds
Refresh reduction: enabled
Hello messages: enabled
    Hello interval: 10 seconds
    Hello multiplier: 4
Fast Re-Route: disabled
    Mode: none
Hierarchical FECs: enabled
Cryptographic authentication: disabled
MTU signaling: disabled
Number of sessions: 1
    Ingress/Transit/Egress: 0/1/0
Number of LSPs: 1
    Operational: 1
        Ingress/Transit/Egress: 0/1/0
Currently using bypass tunnels: 0
Number of bypass tunnels: 0
Number of neighbors: 2
Number of interfaces: 2
```
18.5.16  show mpls rsvp counters

Use the show mpls rsvp counters command to display RSVP message counters, per interface.

Command Mode
EXEC

Command Syntax
show mpls rsvp counters [[ interface [ Ethernet | Fabric | Loopback | Management | Port-Channel | Switch | Tunnel | Vlan | Vxlan ] ] | ipv4 interface | ipv6 interface]

Parameters

- interface Filter by interface.
  - Ethernet Hardware Ethernet interface.
  - Fabric Fabric interfaces.
  - Loopback Hardware interface used for looping packets.
  - Management Management interface.
  - Port-Channel Lag interface.
  - Switch Switch interface.
  - Tunnel Tunnel interface.
  - Vlan Logical interface into a VLAN.
  - Vxlan VXLAN tunnel interface.
- ipv4 Filter by IPv4.
  - interface Filter by interface.
- ipv6 Filter by IPv6.
  - interface Filter by interface.

Example

switch>show mpls rsvp counters
Received Messages:

18.5.17 show mpls rsvp neighbor

Use the `show mpls rsvp neighbor` command to display a summary of all RSVP neighbors, or the list of active LSPs for a specific neighbor.

Command Mode

EXEC

Command Syntax

```
show mpls rsvp neighbor [ A.B.C.D | A:B:C:D:E:F:G:H | summary ]
```

Parameters

- **A.B.C.D** IP (v4 or v6) address of neighbor.
- **A:B:C:D:E:F:G:H** IP (v4 or v6) address of neighbor.
- **summary** Displays summarized information.

Example

- Use the `show mpls rsvp neighbor` command to display a summary of all RSVP neighbors.

```
switch>show mpls rsvp neighbor
Neighbor 10.0.1.1
  Upstream for
    Session #1 LSP #1
  Downstream for
Neighbor uptime: 00:01:24
Authentication type: disabled
Last hello received: 1 seconds ago
Last hello sent: 1 seconds ago
Bypass tunnel: not requested
Neighbor 10.0.2.2
  Upstream for
  Downstream for
  Session #1 LSP #1
Neighbor uptime: 00:01:24
Authentication type: disabled
Last hello received: -
Last hello sent: 31 seconds ago
Bypass tunnel: not requested
```

- Use the `show mpls rsvp neighbor summary` command to display summarized information.

```
switch>show mpls rsvp neighbor summary
Neighbor              Role       Sessions LSPs
--------------------- ========== ======== ========
10.0.1.1              Upstream  1     1
10.0.2.2              Downstream 1     1
```

3196
18.5.18  show mpls rsvp session detail

Use the `show mpls rsvp session detail` to display the detailed information of RSVP sessions.

**Command Mode**
EXEC

**Command Syntax**

```
show mpls rsvp session detail
```

**Example**

```
switch>show mpls rsvp session detail
Session #1
    Destination address: 0.4.4.4
    Tunnel ID: 0
    Extended Tunnel ID: 0.1.1.1
    Role: transit
    LSP #1
        State: up
        MTU Signaling: enabled
        Received Path MTU: 1800 bytes
        Sent Path MTU: 1500 bytes
        [...]
```

18.5.19  show mpls rsvp session summary

Use the `show mpls rsvp session summary` command to filter sessions in the show command and in LSP ping and traceroute commands. Sessions can further be filtered by name, destination, router role (transit/ingress/egress), and state.

**Command Mode**
EXEC

**Command Syntax**

```
show mpls rsvp session summary
```

**Example**

```
switch>show mpls rsvp session summary
Session  Destination        LSP      Name         Role    Bypass State
======== ================== ======== ============ ======= ========
1        0.4.4.4             1        Session1    transit n/req  up
```
**18.5.20  show mpls rsvp session**

Use the `show mpls rsvp session` command to list the current RSVP sessions filtered by IP address.

**Command Mode**

EXEC

**Command Syntax**

`show mpls rsvp session`

**Example**

```
switch>show mpls rsvp session
Session #1
   Destination address: 0.4.4.4
   Tunnel ID: 0
   Extended Tunnel ID: 0.1.1.1
   Role: transit
   LSP #1
      State: up
      Type: primary
      Source address: 0.1.1.1
      LSP ID: 1
      LSP uptime: 00:02:38
      Session name: Session1
      Local label: 100000
      Downstream label: 100000
      Upstream neighbor: 10.0.1.1
      Last refresh received: 17 seconds ago
      Last refresh sent: 10 seconds ago
      Downstream neighbor: 10.0.2.2
      Last refresh received: 7 seconds ago
      Last refresh sent: 9 seconds ago
      Bypass tunnel: not requested
```
18.5.21  show traffic-engineering cspf path

Use the `show traffic-engineering cspf path` command to display all the paths computed by CSPF.

**Command Mode**

EXEC

**Command Syntax**

`show traffic-engineering cspf path [destination-IP] [detail]`

**Parameters**

- **A.B.C.D** CSPF path to this destination IP address.
- **detail** Show detailed path information.

**Examples**

In this example, the CSPF destination path `20.0.0.1` is selected to display.

```
switch>show traffic-engineering cspf path 20.0.0.1

Destination     Constraint                           Path
20.0.0.1        exclude Ethernet1                    0.1.1.1
               exclude SRLG of Ethernet1            0.1.1.2
                                                              0.2.2.2
                                                              3.3.3.2
               exclude Ethernet2                    0.1.1.1
                                                              0.1.1.2
                                                              0.2.2.2
                                                              3.3.3.2
```

In this example, the CSPF destination path `20.0.0.1` is selected to display detailed information.

```
switch>show traffic-engineering cspf path 20.0.0.1 detail

Destination: 20.0.0.1
Path Constraint: exclude Ethernet1
                exclude SRLG of Ethernet1: orange-link (500),
                green-link (400), 100, red-link (200), 600
Request Sequence number: 1
Response Sequence number: 1
Number of times path updated: 2
Last updated: 00:01:58
Reoptimize: Always
Path:
0.1.1.1
0.1.1.2
0.2.2.2
3.3.3.2

Path Constraint: exclude Ethernet2
Request Sequence number: 2
Response Sequence number: 2
Number of times path updated: 3
Last updated: 00:00:38
Reoptimize: Always
Path:
0.1.1.1
0.1.1.2
0.2.2.2
3.3.3.2
```
18.5.22 show traffic-engineering database

Use the show traffic-engineering database to display the topology used for CSPF computations. Starting from EOS Release 4.23.1F, the SRLG group details of a neighbor are shown if it is advertised.

Command Mode
EXEC

Command Syntax
show traffic-engineering database

Special Considerations
- Beginning with EOS Release 4.23.1F, the SRLG group details of a neighbor are shown if it is advertised.
- Beginning with EOS Release 4.24.2F, information for the OSPFv2 topology is displayed if configured.

Example

```
switch#show traffic-engineering database

18.5.23 shutdown

The `shutdown` command disables the RSVP-TE protocol instance or the RSVP-related functions for the interface. The RSVP-TE configuration information associated with the interface is retained.

RSVP-TE is enabled globally by issuing `no shutdown` in the configuration sub-mode. This is the only mandatory setting for RSVP-TE to work. There is no per-interface knob to enable or disable RSVP. However, RSVP is only enabled on interfaces on which MPLS is enabled.

**Command Mode**

Configuration sub-mode for RSVP

**Command Syntax**

`shutdown`

`no shutdown`

**Examples**

- You can enable RSVP-TE globally by issuing the `no shutdown` command.
  
  ```
  (config-mpls-rsvp)#no shutdown
  ```

- Similarly, it is disabled with the `shutdown` command, which is the default.
  
  ```
  (config-mpls-rsvp)#shutdown
  ```
18.5.24  srlg

The srlg command specifies if link SRLGs of a primary LSP are to be considered as constraints while creating a fast-reroute bypass tunnel with either link or node protection. When the srlg command is specified with strict keyword, then when a path for a bypass tunnel excluding SRLGs of next-hop interface of primary LSP can not be found, RSVP does not setup the bypass tunnel. When the srlg command is specified without the strict keyword, then a bypass tunnel is setup with as many links as possible that exclude the SRLGs of next-hop interface of primary LSP and where such links are not available, links that have the least number of SRLGs which are to be excluded are used.

When this CLI is not configured, the behavior remains the same as before, which is to turn off SRLG processing. Therefore, the no and default versions of the command takes you back to the default of SRLG processing being turned off.

Command Mode
Configuration sub-mode for RSVP

Command Syntax
srlg strict
no srlg strict
default srlg strict

Parameters
strict Applies strict SRLG constraints.

Example
• The SRLGs of an interface can be configured using the following traffic-engineering CLIs.

{(config)#interface Et1
  (config-if-Et1)#traffic-engineering srlg 100

{(config)#interface Et2
  (config-if-Et2)#traffic-engineering srlg 200
Visibility and Monitoring Services

The Visibility and Monitors Services chapter contains the following sections:

- Test Access Point (TAP) Aggregation
- Latency Analyzer (LANZ)
- Sampled Flow Tracking
- sFlow
- SNMP
- VM Tracer
- MapReduce Tracer

19.1 Test Access Point (TAP) Aggregation

This section describes test access point (TAP) aggregation and the data structures that it requires. Topics in this section include:

- TAP Aggregation Introduction
- TAP Aggregation Description
- TAP Aggregation Extra MPLS Pop (4 to 6 Labels)
- TAP Aggregation Configuration
- TAP Aggregation Traffic Steering
- TAP Aggregation GUI
- TAP Aggregation Keyframe and Timestamp Configuration
- TAP Aggregation Commands

Port mirroring is described in Test Access Point (TAP) Aggregation.

19.1.1 TAP Aggregation Introduction

Ethernet-based switches are commonly deployed in dedicated networks to support tool access point (TAP) and mirror port traffic toward one or more analysis applications. Ports configured to mirror data can simultaneously switch traffic to its primary destination while directing a copy of that traffic to analysis or test devices. TAP ports are typically part of a dedicated environment that allows for the aggregation of data streams from multiple sources that can be directed to multiple destinations.

Arista switches support port mirroring and TAP aggregation and the data structures required by these functions.

19.1.2 TAP Aggregation Description

These sections describe TAP aggregation, timestamps, and keyframes:

- TAP Aggregation
- Timestamps and Keyframes

19.1.2.1 TAP Aggregation

Tool access point (TAP) aggregation is the accumulation of data streams and the subsequent dispersal of these streams to devices and applications that analyze, test, verify, parse, detect, or store data. TAP
aggregation requires an environment free from switching operations. Arista switches operate in one of two device modes:

- **Switching mode**: the switch performs normal switching and routing operations. Data mirroring is supported in switching mode. Tap aggregation is not available in switching mode.

- **TAP aggregation mode**: The switch is a data-monitoring device and does not provide normal switching and routing services. Data mirroring is not available in tap aggregation mode.

Access control lists, port channels, LAGs, QoS, and VLANs function normally in both modes.

Ethernet and port channel interfaces are configured as **TAP** and **tool** ports to support tap aggregation.

- **TAP ports**: a tap port is an interface that receives a data stream that two network ports exchange.
  - TAP ports prohibit egress traffic. MAC learning is disabled. All control plane interaction is prevented.
  - Traps for inbound traffic are disabled. Tap ports are in STP forwarding mode.

- **Tool ports**: A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to devices that process the monitored data streams.
  - Tool ports prohibit ingress traffic. MAC learning is disabled. All control plane interaction is prevented.
  - Tool ports are in STP forwarding mode.

TAP and tool ports are configured with the `switchport mode` command. These ports are active when the switch is in tap aggregation mode and error-disabled when the switch is in switching mode.

TAP and tool ports are designated through switchport mode commands and act similar to trunk ports, in that they can allow access to VLANs specified through allowed-VLAN lists. Tap ports also specify a native VLAN for handling untagged frames.

Access, trunk, and dot1q-tunnel mode ports are active when the switch is in switching mode and error-disabled when the switch is in tap aggregation mode.

TAP and tool mode ports are active when the switch is in TAP aggregation mode and error-disabled when the switch is in switching mode.

**TAP aggregation groups** are data structures that map a set of TAP ports to a set of tool ports. Both TAP and tool ports may belong to multiple TAP aggregation groups, and a TAP aggregation group may contain multiple TAP and tool ports.

### 19.1.2.2 Timestamps and Keyframes

FM6000 platform switches support packet timestamping of packets sent from any port at line rate. Timestamps are used to correlate network events and in performance analysis. Keyframes provide information to assist in the interpretation of timestamps.

The switch contains two 64-bit counters to maintain ASIC time and UTC time. ASIC time is based on an internal 350 MHz counter. UTC is absolute time that is maintained by a precision oscillator and synchronized through PTP.

Timestamps are derived from the least significant 31 bits of ASIC time. Based on the 350 MHz counter period and 31-bit resolution, timestamp values repeat every 6.135 seconds.

Keyframes are periodically inserted into the data stream to provide context for interpreting timestamps. Keyframes contain the 64-bit value of the ASIC time counter, the corresponding 64-bit value of the UTC time counter, and the elapsed time since the last PTP synchronization of the UTC counter. Inserting one keyframe every second into the data stream assures that the timestamp value in each egress packet can be associated with values of the complete 64-bit ASIC time counter and the corresponding UTC counter.
19.1.2.2.1 Timestamps

Timestamps are based on a frame’s ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Timestamping is configured on the egress port where the timestamp is applied to the frame.

A timestamp consists of the least significant 31 bits of the ASIC time counter. The most significant bit of the least significant byte is a 0 pad, resulting in a 32-bit timestamp with 31 bits of data. The keyframe mechanism provides recovery of the most significant 33 bits of the ASIC counters and a map to UTC time. Applications use this mechanism to determine the absolute time of the frame timestamp.

The switch supports three timestamp modes, which are configurable on individual Ethernet ports. The modes differ in the management of the egress frame’s 32-bit frame check sequence (FCS):

- **Disabled**: timestamping is disabled.
- **FCS Replacement Mode**: the original FCS is discarded, and the ingress timestamp is appended to frame data, followed by a new FCS that is based on the appended timestamp. The result is a valid Ethernet frame, but the headers of all nested protocols are not updated to reflect the timestamp.
- **FCS Appending Mode**: the original FCS is discarded and replaced by the ingress timestamp. The size of the original frame is maintained without any latency impact, but the FCS is not valid.

19.1.2.2.2 Keyframes

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. Keyframes have valid L2 and L3 headers. Keyframes contain these header fields:

- **MAC fields (12 bytes):**
  - Source MAC address is the address of the egress interface transmitting the keyframe.
  - Destination MAC address is configured through a CLI command.
- **IP Header (20 bytes):**
  - Source IP address is configured through CLI; default is management interface IP address.
  - Destination IP address is configured through a CLI command.
  - TTL is set to 64.
  - TOS is set to 0.
  - Protocol field is set to 253.
  - IP header’s ID field is set to 0.

Keyframes contain these payload fields:

- **ASIC time**: (64 bits) ASIC time counter. (2.857 ns resolution).
- **UTC time**: (64 bits) Unix time that corresponds to ASIC time (ns).
- **Last sync time**: (64 bits) ASIC time of most recent PTP synchronization.
- **Keyframe time**: (64 bits) ASIC time of the keyframe’s egress (ns).
- **Egress interface drops**: (64 bits) Number of dropped frames on keyframe’s egress interface.
- **Device ID**: (16 bits) device ID (user defined).
- **Egress interface**: (16 bits) Keyframe’s egress switchport.
- **FCS type (8 bits)**: Timestamping mode configured on keyframe’s egress port.
  - 0: timestamping disabled.
  - 1: timestamp is appended to payload; new FCS is added to the frame.
  - 2: timestamp overwrites the existing FCS.
- **Reserved (8 bits)**: reserved for future use.
- **Skew numerator/skew denominator**: form a ratio indicating the ASIC clock skew. If the ratio is greater than 1, the clock is skewed fast; if the ratio is less than 1, the clock is skewed slow.
Last sync time equals 0 when there was no previous synchronization or the time since the last synchronization is greater than 8 hours.

The 31-bit frame timestamp provides high-resolution timing, rolling over about every 6.135 seconds (31 bits at 2.857ns per tick). To obtain the full ASIC time and to correlate the timestamp to an absolute UTC time, the switch sends keyframes. Each keyframe contains the current ASIC time and UTC time; hence an application can compute the high order bits of the ASIC time (for precise, relative timing) from the ASIC to UTC time mapping, and then determine absolute time.

ASIC to UTC time conversion is not quite immediate, so the UTC time in the frame will not be the current time. A keyframe timestamp is provided for this purpose. The frame also includes the timestamping mode (FCS type) so applications can dynamically determine the timestamp’s byte offset. Each field is shown in the following table.

**Table 76: Keyframe Payload**

<table>

### 19.1.3 TAP Aggregation Extra MPLS Pop (4 to 6 Labels)

Available starting with *EOS Release 4.23.1F* extra MPLS pop for TAP Aggregation allows you to remove four to six MPLS labels from a packet. Previously, only one to three labels were able to be popped.

When configured, popping four to six MPLS labels will work in all the cases where popping one to three MPLS labels works. MPLS pop for 1 to 3 labels can be found here: [https://eos.arista.com/eos-4-15-0f/tap-aggregation-mpls-pop/](https://eos.arista.com/eos-4-15-0f/tap-aggregation-mpls-pop/).

### 19.1.3.1 TAP Aggregation Extra MPLS Pop Platform Compatibility

The following platforms support TAP aggregation extra MPLS pop:

- DCS-7020
- DCS-7280/R/R2 series
- DCS-7500/R/R2 series

### 19.1.3.2 Limitations

#### 19.1.3.2.1 IP Steering

IP steering does not work for MPLS packets with four or more labels. Currently, you must work around this limitation with a configuration similar to the Configuration for IP Steering below. This workaround does not work when MPLS pop is not enabled.
19.1.3.2.2 Configuration for IP Steering

When MPLS pop is enabled, you can enable IP steering for up to six MPLS labels by adding an extra port into the configuration as a tap-tool port.

For example, you want to perform IP steering from interface Ethernet1 to a set of interfaces and also want MPLS labels to be popped. Add a new interface Ethernet2, which will not receive any external traffic, as a tap-tool port with traffic loopback. Then configure Ethernet1 to forward to Ethernet2 as its default interface. The commands would look similar to the following:

```
(config-if-Et2)#swi mode tap-tool
(config-if-Et2)#traffic-loopback source system device phy
(config-if-Et2)#int et1
(config-if-Et1)#swi tap default interface et2
```

All of Ethernet1's old tool ports should be disabled and become Ethernet2's tool ports. Then, all IP steering configuration that was originally meant to be between ET1 and its old tool ports should be configured with Ethernet2 in place of Ethernet1. Finally, configure MPLS pop on Ethernet1.

19.1.3.3 TAP Aggregation Extra MPLS POP (4 to 6 Labels) Commands

```
show hardware tcam profile
```

19.1.4 TAP Aggregation Configuration

These sections describe TAP aggregation configuration tasks:

- Enabling Tap Aggregation Mode
- Tap Aggregation Mixed Mode
- Tap Port Configuration
- Tool Port Configuration
- Per-linecard TCAM Profile Configuration
- Two-Way Ports for Tap Aggregation
- Tap Aggregation QoS Handling on Tap Ports
- Identity VLAN Tagging
- Tap Aggregation Group Configuration

19.1.4.1 Enabling Tap Aggregation Mode

The switch supports switching mode and TAP aggregation mode. In switching mode, normal switching and routing functions are supported while TAP aggregation functions are disabled. In TAP aggregation mode, TAP aggregation functions are enabled while normal switching and routing functions are disabled. By default, the switch is in switching mode.

A port's switchport status depends on its switchport mode and the switch's TAP aggregation mode.

- Tap aggregation mode enabled: TAP and tool ports are enabled. Switching ports are errdisables.
- Tap aggregation mode disabled: TAP and tool ports are errdisables. Switching ports are enabled.

To enable the switch to carry out TAP aggregation, first enter TAP aggregation configuration mode using the tap aggregation command, then set the mode to exclusive.

Note: The switch can also perform TAP aggregation in mixed mode. See Mixed Mode Configuration.
Example

- These commands enter TAP aggregation configuration mode, then place the switch in TAP aggregation exclusive mode.

```bash
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
  mode exclusive
switch(config-tap-agg)#
```

To return the switch to switching mode, remove the `mode` command from `running-config`.

Examples

- These commands enter TAP aggregation configuration mode, then place the switch in switching mode.

```bash
switch(config)#tap aggregation
switch(config-tap-agg)#no mode
switch(config-tap-agg)#show active
switch(config-tap-agg)#
```

- These commands enter switching mode and remove all TAP aggregation configuration mode statements.

```bash
switch(config)#no tap aggregation
switch(config)#
```

19.1.4.2  TAP Aggregation Mixed Mode

On a modular switch, the user can configure TAP Aggregation on some linecards and leave other linecards to operate normally. This is referred to as TAP aggregation mixed mode.

- Mixed Mode Platform Compatibility
- Mixed Mode Configuration

19.1.4.2.1  Mixed Mode Platform Compatibility

The following platforms support TAP Aggregation Mixed Mode.

- DCS-7500R
- DCS-7500R2

19.1.4.2.2  Mixed Mode Configuration

Complete the following steps to configure Linecard 3 as a TAP aggregation linecard in mixed mode.

1. Enable the switch for configuration.

```bash
switch>configure terminal
```
2. Enable TAP aggregation.

```
switch(config)#tap aggregation
```

3. Enable TAP aggregation mixed mode, selecting the targeted linecard module using the TAP aggregation default.

```
switch(config-tap-agg)#mode mixed module linecard 3 tap-aggregation-default
```

**Note:** Changing modes may affect available functionality. Unsupported configuration elements will be ignored.

The profile selection in mixed mode is the same as in exclusive mode. The user can configure multiple linecards for TAP aggregation in mixed mode.

The user can check TAP Aggregation Mixed Mode status by executing the following show commands:

```
switch(config)#show running-config section tap
tap aggregation
    mode mixed module linecard 3 profile tap-aggregation-default
```

```
switch(config)#show hardware tcam profile
Configuration        Status
Linecard4            default              default
Linecard3            default              tap-aggregation-default
Linecard6            default              default
```

19.1.4.3 TAP Port Configuration

TAP ports function when the switch is in TAP aggregation mode. TAP ports receive traffic for replication to one or more tool ports. In TAP aggregation mode, TAP ports are in STP forwarding state and prohibit egress traffic. MAC learning, control plane interaction and traps for inbound traffic are disabled.

TAP mode ports are configured through switchport mode commands. TAP mode command settings persist in `running-config` without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tap port configuration steps.

- Configuring an Interface as a TAP Mode Port
- TAP Port Allowed VLAN List Configuration
- TAP Port Native VLAN
- TAP Port Packet Truncation

**Configuring an Interface as a Tap Mode Port**

Ethernet and port-channel interfaces are configured as TAP ports with the `switchport mode` command.

**Example**

- These commands configure Ethernet interfaces 41 through 43 as TAP mode ports.

```
switch(config)#interface ethernet 41-43
switch(config-if-Et41-43)#switchport mode tap
switch(config-if-Et41-43)#show interface ethernet 41-43 tap
```
TAP Port Allowed VLAN List Configuration

By default, TAP mode interfaces handle tagged traffic for all VLANs. The `switchport tap allowed vlan` command creates or modifies the set of VLANs for which a TAP port handles tagged traffic.

**Example**

These commands create TAP-mode allowed VLAN lists for Ethernet interfaces 41 through 43.

```plaintext
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap allowed vlan 401-410
switch(config-if-Et41)#interface ethernet 42
switch(config-if-Et42)#switchport tap allowed vlan 411-420
switch(config-if-Et42)#interface ethernet 41-42
switch(config-if-Et41-42)#show active
interface Ethernet41
    switchport mode tap
    switchport tap allowed vlan 401-410
interface Ethernet42
    switchport mode tap
    switchport tap allowed vlan 411-420
switch(config-if-Et41-42)#
```

TAP Port Native VLAN

Tap mode Interfaces associate untagged frames with the tap mode native VLAN. The `switchport tap native vlan` command specifies the TAP-mode native VLAN for the configuration-mode interface. The default TAP-mode native VLAN for all interfaces is VLAN 1.

**Example**

These commands assign VLAN 400 as the TAP-mode native VLAN for Ethernet interface 41.

```plaintext
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap native vlan 400
switch(config-if-Et41)#show interface ethernet 41-43 tap
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Native</th>
<th>Id</th>
<th>Truncation Default</th>
<th>Mode</th>
<th>Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et41</td>

<td></td>
</tr>
<tr>
<td>Et43</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```
TAP Port Packet Truncation

TAP ports can be configured to truncate inbound packets. The `switchport tap truncation` command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. By default, TAP ports do not truncate packets.

### Examples

- These commands configure Ethernet interface 41 to truncate packets to 150 bytes.

```plaintext
switch(config)#interface ethernet 41
switch(config-if-Et41)#switchport tap truncation 150
switch(config-if-Et41)#show interface ethernet 41-43 tap
```

```
Port  Truncation  Status  Native  Id
-----  Default    Mode    Vlan  Vlan
Group  Mode

************

Et41    tap  tap  400  1  150
---
Et42    tap  tap  1   1  0
---
Et43    tap  tap  1   1  0
---
```

- These commands configure Ethernet interface 41 to send complete packets for replication.

```plaintext
switch(config-if-Et41)#no switchport tap truncation
switch(config-if-Et41)#show interface ethernet 41 tap
```

```
Port  Truncation  Status  Native  Id
-----  Default    Mode    Vlan  Vlan
Group  Mode

************

Et41    tap  tap  400  1  0
---
```
19.1.4.4 Tool Port Configuration

Tool ports replicate traffic received by TAP ports. Tool ports are mapped to the TAP ports through TAP aggregation groups. A tool port may belong to multiple aggregation groups and an aggregation group may contain multiple tool ports.

Tool ports function when the switch is in TAP aggregation mode. In this switch mode, tool ports are in STP forwarding state and ingress traffic is prohibited. MAC learning, control plane interaction, and traps for inbound traffic are disabled. All control plane interaction is prevented and L2 agents do not send PDUs to tool-mode interfaces. When the switch is in switching mode, tool ports are error-disabled.

Tool-mode ports are configured through switchport commands. Tool-mode command settings persist in running-config without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

This section describes the following tool port configuration steps.

- Configuring an Interface as a Tool-mode Port
- Tool Port Allowed VLAN List Configuration
- Tool Port Packet Truncation

Configuring an Interface as a Tool-mode Port

Ethernet and port channel interfaces are configured as tool ports with the `switchport mode` command.

```
Example
These commands configure port-channel interfaces 101 through 103 as tool-mode ports and display the result.

switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport mode tool
switch(config-if-Po101-103)#show interface port-channel 101-103
tool
Port    Configured   Status     Allowed    Id
Timestamp Mode     Vlans     Tag
------------- ------------ --------- ----------- ----
Po101    tool        tool      All        Off
---
Po102    tool        tool      All        Off
---
Po103    tool        tool      All        Off
---
switch(config-if-Po101-103)#
```

Tool Port Allowed VLAN List Configuration

By default, tool mode interfaces handle tagged traffic for all VLANs. The `switchport tool allowed vlan` command creates or modifies the set of VLANs for which a tool port handles tagged traffic.

```
Example
```
These commands create tool mode allowed VLAN lists for port-channel interfaces 101 through 103.

```plaintext
switch(config)#interface port-channel 101-103
switch(config-if-Po101-103)#switchport tool allowed vlan 1010-1020
switch(config-if-Po101-103)#interface port-channel 101
switch(config-if-Po101)#switchport tool allowed vlan add 1001-1009
switch(config-if-Po101-103)#interface port-channel 102
switch(config-if-Po102)#switchport tool allowed vlan remove 1016-1020
switch(config-if-Po102)#interface port-channel 103
switch(config-if-Po103)#switchport tool allowed vlan add 1021-1030
switch(config-if-Po103)#show interface port-channel 101-103 tool
```

---

### Tool Port Packet Truncation

Tool ports can be configured to truncate outbound packets. The `switchport tool truncation` command configures the configuration-mode interface, as a tool port, to truncate outbound packets to 160 bytes. By default, tool ports do not truncate packets.

Tool port packet truncation is supported only on the 7150 series platform.

**Examples**

- These commands configure Ethernet interface 41, as a tool port, to truncate packets on egress to 160 bytes.

  ```plaintext
  switch(config)#interface ethernet 41
  switch(config-if-Et41)#switchport mode tool
  switch(config-if-Et41)#switchport tool truncation 160
  switch(config-if-Et41)#
  ```

- These commands configure Ethernet interface 41 to send complete packets.

  ```plaintext
  switch(config-if-Et41)#no switchport tool truncation
  switch(config-if-Et41)#
  ```
19.1.4.5 Per-linecard TCAM Profile Configuration

This feature gives the ability to specify different profiles for different linecards in mixed mode. The following platforms support per-linecard TCAM profile configuration:

- DCS-7500
- DCS-7500R
- DCS-7500R2

To enable the TAP aggregation mode and configure a TCAM profile for a linecard set, complete the following steps:

1. Enable the switch for configuration.

   switch>configure terminal

2. Enable TAP aggregation mode.

   switch(config)#tap aggregation

3. Configure the TCAM profile for a linecard set.

   switch(config-tap-agg)#mode mixed module linecard 3,4 profile tap-aggregation-default
   switch(config-tap-agg)#mode mixed module linecard 5,6 profile tap-aggregation-extended
   switch(config-tap-agg)#

To disable TAP aggregation on a linecard set, complete the following steps:

1. Enable the switch for configuration.

   switch>configure terminal

2. Enable TAP aggregation mode.

   switch(config)#tap aggregation

3. Disable TAP aggregation for a linecard set.

   switch(config-tap-agg)#no mode mixed module linecard 3,4
   switch(config-tap-agg)#

   **Note:** If a TAP is a port-channel, its members must all come from linecards using the same profile.

19.1.4.6 Two-Way Ports for TAP Aggregation

While in TAP aggregation mode, there is support for traffic only in one direction through either TAP ports that receive packets from mirroring, or through optical TAP or tool ports that send out packets to customer devices. Two-way ports for TAP aggregation allow bidirectional transmit and receive capability on a single port in TAP aggregation mode. Using the TAP-tool switchport mode enables both TAP and tool configurations simultaneously on an interface.

- Two-Way Ports Platform Compatibility
- Two-Way Ports Configuration

19.1.4.6.1 Two-Way Ports Platform Compatibility

The following platforms support two-way ports for TAP aggregation.
19.1.4.6.2 Two-Way Ports Configuration

To enable a two-way port, use the `tap-tool` option of the `switchport mode` command.

**Example**

The following commands configure Ethernet interface 4/1 as a two-way port, allowing it to function as both a TAP and a tool port.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#switchport mode tap-tool
switch(config-if-Et4/1)#
```

Additional configurations for TAP and tool functionality on the interface remain the same. Once the user enables the TAP-tool switchport mode on the interface, they can use the existing TAP and tool mode commands to enable their respective configurations.

Arista recommends using this feature with unidirectional send-receive enabled on the interface, which allows the receiver and transmitter for the interface to operate independently. If one goes down, the other remains active. To enable unidirectional send-receive on an interface, use the `unidirectional send-receive` command.

**Example**

These commands enable unidirectional send-receive on Ethernet interface 4/1.

```
switch(config)#interface ethernet 4/1
switch(config-if-Et4/1)#unidirectional send-receive
switch(config-if-Et4/1)#
```

19.1.4.7 TAP Aggregation QoS Handling on TAP Ports

Before EOS 4.20.5F, QoS behavior was not enforced for TAP aggregation ports, meaning that QoS behavior for packets passing through the device was not changed.

- QoS Handling Platform Compatibility
- QoS Handling Configuration
- Displaying QoS Handling Status

19.1.4.7.1 QoS Handling Platform Compatibility

The following platforms support QoS handling on TAP ports.

- DCS-7280E
- DCS-7280R
- DCS-7500E
- DCS-7500R
- DCS-7280R2
Note: QoS is not available on TAP aggregation ports on the DCS-7150.

19.1.4.7.2 QoS Handling Configuration

Trust Mode of TAP Ports

TAP ports are in QoS untrusted mode by default. This means that the QoS marking of an incoming packet is not trusted when determining the QoS attributes of the packet. Therefore, the default QoS handling takes place. Consider the default CoS to traffic class mapping in the following example.

```
switch(config)#show qos maps
[...]
Cos-tc map:
  cos: 0 1 2 3 4 5 6 7
  tc: 1 0 2 3 4 5 6 7
[...]
```

The Class of Service (CoS) field of incoming packets is ignored and is assumed to be zero. In this example, all packets are assigned to traffic class 1 when using the above mapping.

To override the default trust mode behavior on a TAP port, use the `qos trust` command.

Example

The following commands override the default trust mode behavior on Ethernet port 1, configuring it to use Class of Service (CoS) trust mode instead so that incoming packets will be placed in their CoS-marked classes.

```
switch(config-if-Et1)#qos trust cos
switch(config-if-Et1)#
```

Class of Service Rewrite of TAP Ports

By default, TAP ports do not override the existing Class of Service (CoS) field of incoming packets. In other words, the CoS marking of steered packets is not changed in any way.

However, the CoS field of added tags may change according to the traffic class to CoS mapping. For example, the identity tag added by TAP ports may have the CoS value from the global traffic class to CoS mapping. Consider the following mapping:

```
switch(config)#show qos maps
[...]
Tc-cos map:
  tc: 0 1 2 3 4 5 6 7
  cos: 1 7 2 3 4 5 6 0
[...]
```

Using this mapping, the added tag CoS field of packets assigned to traffic class 1 may be set to 7.

19.1.4.7.3 Displaying QoS Handling Status

Use the Displaying QoS Handling Status to see the active QoS mappings.
Example
This command displays the QoS maps that are configured on the switch.

```
switch#show qos maps
Number of Traffic Classes supported: 8
    Number of Transmit Queues supported: 8
    Cos Rewrite:  Disabled
    Dscp Rewrite:  Disabled

    Cos-tc map:
    cos:  0 1 2 3 4 5 6 7
          ----------------------------
    tc:   1 0 2 3 4 5 6 7

    Dscp-tc map:
    d1 :  d2 0 1 2 3 4 5 6 7 8 9
          --------------------------------------
    0 :     1 1 1 1 1 1 1 1 0 0
    1 :     0 0 0 0 0 2 2 2 2 2
    2 :     2 2 2 2 3 3 3 3 3 3
    3 :     3 3 4 4 4 4 4 4 4 4
    4 :     5 5 5 5 5 5 5 5 6 6
    5 :     6 6 6 6 6 6 7 7 7 7
    6 :     7 7 7 7

    Tc-cos map:
    tc:  0 1 2 3 4 5 6 7
          ----------------------------
    cos:  1 0 2 3 4 5 6 7

    Tc-dscp map:
    tc:  0 1 2 3 4 5 6 7
          ----------------------------
    dscp:  8 0 16 24 32 40 48 56

    Tc - tx-queue map:
    tc:  0 1 2 3 4 5 6 7
          ----------------------------
    tx-queue:  0 1 2 3 4 5 6 7

switch#
```

19.1.4.8 Identity VLAN Tagging

By default, tool port output packets are identical to the replicated packets they receive from the tap ports to which they are associated. Identity tagging modifies packets sent by tool ports by adding a dot1q VLAN tag that identifies the originating TAP port. Each TAP port is associated with an identity number. Tool ports that are configured to add an identity tag append the originating TAP port’s identity number in the outer layer (or s-VLAN) tag.

The following sections describe identity VLAN tagging on TAP and tool ports.

- **Tap Port Identity Value Configuration**
- **Tool Port Identity Tag Configuration**
Tap Port Identity Value Configuration

The `switchport tap identity` command configures the TAP port identity value for the configuration-mode interface. The default identity value for all TAP ports is 1.

**Example**

These commands configure 1042 as the identity value for Ethernet interface 42 and display the result.

```plaintext
switch(config)#interface ethernet 42
switch(config-if-Et42)#switchport tap identity 1042
switch(config-if-Et42)#show interface ethernet 41-43 tap
Port  Configured  Status  Native  Id  Truncation
Group  Mode  Mode  Vlan  Vlan
Et41   tap  tap  400  1  0
Et42   tap  tap  1  1042 0
Et43   tap  tap  1  1  0
switch(config-if-Et42)#
```

Tool Port Identity Tag Configuration

The `switchport tool identity` command configures the configuration-mode interface to include a tier-1 VLAN tag (dot1q) in packets it transmits. The VLAN number on the dot1q tag is the identity value configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

**Example**

These commands configure port channel 102 to include the identity tag in packets it transmits.

```plaintext
switch(config)#interface port-channel 102
switch(config-if-Po102)#switchport tool identity dot1q
switch(config-if-Po102)#show interface port-channel 101-103 tool
Port  Configured  Status  Allowed  Id  Vlans  Tag
Po101  tool  tool  1001-1020  Off
Po102  tool  tool  1010-1015  On
Po103  tool  tool  1010-1030  Off
switch(config-if-Po102)#
```
TAP Aggregation Group Configuration

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A tool port replicates packets it receives from TAP ports that are in the aggregation groups to which it belongs. A TAP port can be configured to send data to multiple TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. TAP aggregation groups may contain multiple TAP ports and multiple tool ports.

The following sections describe the configuration of TAP aggregation groups:

- Assigning a Tool Port to a TAP Aggregation Group
- Assigning TAP Ports to a TAP Aggregation Group
- Viewing TAP Aggregation Group Assignments
- LAGs in Tool Groups

Assigning a Tool Port to a TAP Aggregation Group

Tool ports are assigned to a TAP aggregation group through the `switchport tool group` command. Each command either creates a list or alters the existing list of groups to which a tool port belongs.

**Examples**

- These commands create the list of TAP aggregation groups for port-channel interface 101.

  ```
  switch(config)#interface port-channel 101
  switch(config-if-Po101)#switchport tool group set analyze1 analyze2 analyze3
  switch(config-if-Po101)#show active
  interface Port-Channel101
  switchport mode tool
  switchport tap identity 2101
  switchport tool allowed vlan 1001-1020
  switchport tap default group tag-9
  switchport tool group set analyze3 analyze1 analyze2
  switch(config-if-Po101)#
  ```

- These commands remove “analyze-1” from port channel 101’s TAP aggregation group list.

  ```
  switch(config-if-Po101)#switchport tool group remove analyze1
  switch(config-if-Po101)#show active
  interface Port-Channel101
  switchport mode tool
  switchport tap identity 2101
  switchport tool allowed vlan 1001-1020
  switchport tap default group tag-9
  switchport tool group set analyze3 analyze2
  switch(config-if-Po101)#
  ```

Assigning TAP Ports to a TAP Aggregation Group

TAP ports are assigned to a TAP aggregation group using the `switchport tap default group` command. Multiple ports are added to a group by entering the command in interface configuration mode for each port.
Example

These commands assign Ethernet interfaces 41 through 43 to TAP aggregation groups “analyze2” (41 and 42) and “analyze3” (43).

```
switch(config)#interface ethernet 41-42
switch(config-if-Et41-42)#switchport tap default group analyze2
switch(config-if-Et41-42)#interface ethernet 43
switch(config-if-Et43)#switchport tap default group analyze3
switch(config-if-Et43)#show interface ethernet 41-43 tap
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Configured</th>
<th>Status</th>
<th>Native</th>
<th>Id</th>
<th>Truncation</th>
<th>Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Et41</td>
<td>tap</td>
<td>tap</td>
<td>400</td>
<td>1</td>
<td>0</td>
<td>analyze2</td>
</tr>
<tr>
<td>Et42</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1042</td>
<td>0</td>
<td>analyze2</td>
</tr>
<tr>
<td>Et43</td>
<td>tap</td>
<td>tap</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>analyze3</td>
</tr>
</tbody>
</table>

Viewing TAP Aggregation Group Assignments

TAP aggregation group membership is displayed by `show tap aggregation groups`. Options allow the display of individual groups or of all configured groups. The command displays active tool and TAP ports by default, and provides an option to display configured ports that are not active.

Example

This command displays the contents of all configured TAP aggregation groups.

```
switch#show tap aggregation groups
```

<table>
<thead>
<tr>
<th>Group Name</th>
<th>Tool Members</th>
</tr>
</thead>
<tbody>
<tr>
<td>analyze2</td>
<td>Po101, Po102</td>
</tr>
<tr>
<td>analyze3</td>
<td>Po101, Po103</td>
</tr>
</tbody>
</table>

LAGs in Tool Groups

Link Aggregation Groups (LAGs) can be included in tool groups for load balancing. A tool group can contain both LAGs and regular ports. Each member of a tool group receives one copy of the traffic destined to the group. Traffic is replicated to tool group members using multicast replication. The traffic replicated to LAGs is then load balanced to their members as per load-balance policies configured on the system.
If a tool group has no more than 60 members with at least one hardware LAG, then the replication mode of the tool group is set to ingress-only. Otherwise, the replication mode of the tool group is set to the configured system default multicast replication mode. See `platform sand multicast replication default` for more information on configuration of the system default replication mode.

**Example**
The following command changes the system-wide default multicast replication mode to ingress.

```
switch(config)#platform sand multicast replication default ingress
switch(config)#
```

### 19.1.5 TAP Aggregation Extra MPLS Pop Configuration

MPLS pop is configurable per tap port as follows to pop one to three labels:

```
(config-if-Et1/1)#switchport tap mpls pop all
```

However, MPLS pop for four to six labels requires a user defined TAP Aggregation profile based on off of tap-aggregation-extended. This profile must have one action and three fields configured under the tapagg port feature, such as the following:

```
(config)#hardware tcam
(config-hw-tcam)#profile foo copy tap-aggregation-extended
(config-profile-foo)#feature tapagg port
(config-profile-foo-feature-tapagg-port)#action set-fwd-header
(config-profile-foo-feature-tapagg-port)#key field mpls-label1-lower-24b mpls-label2-lower-24b mpls-label3-lower-24b
(config-profile-foo-feature-tapagg-port)#tap aggregation
Saving new profile 'foo'
(config-tap-agg)#mode exclusive profile foo
```

With the above profile changes, four to six MLPS label pop is additionally supported when the MPLS pop feature is configured on a tap port.

To check if a profile is installed correctly, use the `show hardware tcam profile` command.

```
(config-tap-agg)#show hardware tcam profile
```

Upon successful installation of a TAP Aggregation profile, you should see a display similar to the following:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>FixedSystem</td>
<td>foo*</td>
</tr>
<tr>
<td>foo</td>
<td></td>
</tr>
</tbody>
</table>
19.1.5.1 Configuring a Local LFIB Convergence Delay for Protected Node or Adjacency Segments

The point of local repair (PLR) switches to the TI-LFA backup path on link failure or BFD neighbor failure but switches back to the post-convergence path once the PLR computes SPF and updates its LFIB. This sequence of events can lead to micro-loops in the topology if the PLR converges faster than other routers along the post-convergence path. So a configuration option is provided to apply a delay, after which the LFIB route being protected by the TI-LFA loop-free repair path will be replaced by the post-convergence LFIB route.

To configure a convergence delay only to LFIB routes that are being protected, the following command is used either in the router IS-IS mode or the router IS-IS address-family sub-mode. A default of 10 seconds is used when using the command without an explicitly specified delay.

```
switch(config-router-isis-af)#timers local-convergence-delay [<delay_in_seconds>] protected-prefixes
```

19.1.6 TAP Aggregation Traffic Steering

Traffic steering is a TAP aggregation process that uses class maps and policy maps to direct data streams at tool ports that are not otherwise associated to the ingress TAP port. A policy map is a data structure that filters data streams upon which identity VLAN tagging or TAP aggregation group assignment is implemented.

TAP-aggregation class maps and policy maps are similar to QoS and control-plane maps. However, policy maps and their components are not interchangeable among function types.

19.1.6.1 TAP Aggregation Policies

A policy map filters data packets by using classes and match rules. Each class contains an eponymous class map and a traffic resolution command. Each match rule contains packet content descriptors and a traffic resolution parameter.

- A class map uses ACLs that identify packets that comprise a specified data stream
- Packet content descriptors specify packet field values that are compared to inbound packets.
- A traffic resolution command or parameter specifies data handling methods for filtered traffic.

Each data packet entering an entity to which a policy map is assigned is managed as defined by the traffic resolution command of the highest priority class or rule that matches the packet.

Class maps are user-created and can be edited or deleted. They filter traffic with IPv4 ACLs and are listed in `running-config`. TAP aggregation traffic resolution commands do one the following:

- specify a TAP aggregation group to direct the packet.
- specify a VLAN number for identity tagging the packet.

TAP aggregation policy maps do not define an implicit deny statement. Packets that do not match a policy map class or rule are replicated and sent out tool ports specified by the default aggregation group assigned to the ingress TAP port. If no default group is selected, these packets are dropped.

19.1.6.2 Configuring TAP Aggregation Traffic Policies

TAP aggregation traffic policies are implemented by creating class maps and policy maps, then applying the policy maps to Ethernet and port-channel interfaces.
Creating Class Maps

A class map is an ordered list of IPv4 access control lists (ACLs). Each ACL is assigned a sequence number that specifies its priority in the class map. TAP aggregation class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class maps are created and modified in class-map configuration mode, which is entered using the `class-map type tapagg`. The `match (class-map (tapagg))` command inserts a specified ACL into the class map, assigning it a sequence number that denotes its placement.

Class-map configuration mode is a group-change mode. Changes made in a group-change mode are saved by exiting the mode. The `show active` command displays the saved version of class map. The `exit` command returns the switch to global configuration mode and saves pending class-map changes. The `abort` command returns the switch to global configuration mode and discards pending changes.

Examples

- This command creates a TAP aggregation class map named `t-class_1` and places the switch in class-map configuration mode.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```

- These commands add two IPv4 ACLs (`tacl-1` and `tacl-2`) to the `t-class_1` class map. The commands use the default method of assigning sequence numbers to the ACLs.

```
switch(config-cmap-t-class_1)#match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

- These commands exit class-map configuration mode, store pending changes to `running-config`, then display the class map.

```
switch(config-cmap-t-class_1)#exit
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#show active
class-map type tapagg match-any t-class_1
  10 match ip access-group tacl-1
  20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```

Creating Policy Maps

Policy maps are created and modified in policy-map configuration mode. A policy map is an ordered list of classes and match rules. Policy maps are edited by adding or removing map elements. Data packets are managed by commands of the highest priority class or rule that matches the packet.

Classes

Each class contains a class map, a set command, and a sequence number:

- The `class map` identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode.
- The `set` command specifies the replication method for filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The `sequence number` specifies the class’s priority within the policy map. Lower sequence numbers denote higher priority.
Matching Rules

Each rule contains a filter list, an action, and a sequence number:

- The **filter list** identifies a data stream by using a set of packet field values.
- The action, (**SET_VALUE** parameter) specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The **sequence number** specifies the rule’s priority within the policy map. Lower sequence numbers denote higher priority.

Policy-map and policy-map-class configuration modes are group-change modes. Changes are saved with the **exit** command or discarded with the **abort** command. The **show active** and **show pending** commands display the saved and modified policy map versions respectively.

The **class** (**policy-map (tapagg)**) command enters policy-map configuration mode.

**Example**

This command creates the TAP aggregation policy map named **t-policy_1** and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```

The **class** (**policy-map (tapagg)**) command adds a class to the configuration mode policy map and places the switch in policy-map-class configuration mode for adding a traffic resolution command to the class. The **set** (**policy-map-class (tapagg)**) command specifies the data replication method for traffic filtered by the associated class map in the configuration-mode policy map. The **set** command performs one of the following replication actions for filtered data packets.

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

**Examples**

- These commands add the **t-class_1** class map to the **t-policy_1** policy map, associate a set statement with the class, then save the policy map by exiting the modes. Packets filtered by the class map are identity tagged with **VLAN 444** and replicated as specified by the **t-grp** aggregation group.

```
switch(config-pmap-t-policy_1)#class t-class_1
t-grp id-tag 444
switch(config-pmap-t-policy_1)#set aggregation-group t-grp id-tag 444
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
10 class t-class_1
set aggregation-group t-group id-tag 444
switch(config-pmap-t-policy_1)#
```

The **match** (**policy-map (tapagg)**) command adds a match rule to the configuration-mode TAP aggregation policy map.

- This command enters policy-map configuration mode for **t-policy_1**, then creates a match rule for the policy map that filters OSPF packets and replicates them as specified by the **t-grp** TAP aggregation group.

```
switch(config-pmap-t-policy_1)#match ip ospf any any set aggregation-group t-grp
```
Applying Policy Maps to an Interface

The `service-policy type tapagg (Interface mode)` command applies a specified policy map to the configuration-mode interface.

Example

These commands apply the `t-policy_1` policy map to `interface ethernet 17`.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#service-policy type tapagg input tpolicy_1
switch(config-if-Et17)#
```

Stripping VLAN Tags

The traffic-steering policies in tap aggregation mode allows steering traffic from tap ports to tool ports using `set (policy-map-class (tapagg))` command, while the `set id-tag` tags the traffic with the specified VLAN ID in the dot1q format. The `class (policy-map (tapagg))` command allows removing VLAN tags from the steered traffic. It supports all traffic types that the traffic steering policies support such as IPv4, IPv6, and MAC.

A tap port is an interface that receives a data stream where two network ports exchange.

A tool port is an interface that replicates data streams received by one or more tap ports. Tool ports connect to the devices that process monitored data streams.

Example

These commands place the switch in policy-map-class to add the `t-class_1` class map to the `t-policy_1` policy map. The first, second, or both of the 2 outer-most VLAN tags are stripped.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-t-policy_1t-class_1)#set aggregation-group t-group remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group id-tag 10 remove dot1q outer 1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10 remove dot1q outer 1-2
```

19.1.7 TAP Aggregation GUI

The switch provides a graphical user interface (GUI) for creating and viewing a TAP aggregation configuration and displaying LANZ traffic statistics.

All commands available on the GUI are accessible through the CLI. The TAP aggregation configuration created through either the CLI or the GUI can be viewed and modified through either medium.

This section provides a brief description of the TAP aggregation GUI.
19.1.7.1  Accessing the TAP Aggregation GUI

The URL for the TAP aggregation GUI is: //hostname/apps/TapAgg/index.html where the hostname is the switch’s configured hostname. The “TAP Aggregation GUI Initial Panel” displays the initial TAP aggregation GUI panel for the switch with the hostname “ro402.”

The TAP aggregation panel contains two sections:

- The configuration section displays the TAP aggregation configuration, including the TAP interfaces, tool interfaces, and aggregation groups. Links are displayed to indicate interface group membership.
- The component section displays information and control buttons for the active configuration entity. When an entity is not selected, the section displays information for the switch (device).

The configuration section displays TAP aggregation components only when the switch is in TAP aggregation mode. To enter TAP aggregation mode, click the TAP Aggregation icon in the component section for the device. The icon is a toggle mechanism; clicking it again disables TAP aggregation mode.

![Figure 138: TAP Aggregation GUI Initial Panel](image)

19.1.7.2  Viewing TAP Aggregation Component Details

“TAP Aggregation GUI Panel with TAP Aggregation Mode Enabled” displays the TAP aggregation panel when the switch is in TAP aggregation mode. The configuration section indicates that the TAP aggregation configuration consists of three tool interfaces, one TAP interface, and four aggregation groups. Ethernet port 10 is the active component; configuration control and traffic information for this interface is available in the component section.

The active component is changed by clicking on the desired component in the configuration section. To display device (switch) information, click on any configuration section outside of any component.

19.1.7.3  Modifying a TAP Aggregation Configuration

The TAP aggregation configuration can be modified only when the switch is in TAP aggregation mode, (see Accessing the TAP Aggregation GUI). The following is a partial list of configuration tasks that are available from the GUI:
• **adding a TAP or tool interface**: begin typing the interface name in the desired add-interface data entry area to access a drop-down list of available interfaces. Select the desired interface and press the **Add** button.

• **removing an interface from the configuration**: select the desired interface in the configuration section and click the deconfigure button in that interface’s component section.

• **adding an aggregation group**: type the desired name of the new group in the data entry area and press the **Add** button. The TAP aggregation group name can consist of alphanumeric characters and specific special characters (-_\[
\] {} :) only.

• **adding an interface to an aggregation group**: select the desired interface in the configuration section, then press the icon of the group in the group membership area of the interface’s component section.

Group icons are toggle buttons; clicking the icon of a group to which the interface belongs removes that interface from the group.

19.1.8 **TAP Aggregation Keyframe and Timestamp Configuration**

This section contains the following topics:

- **TAP Aggregation Keyframe and Timestamp Configuration**
- **Enabling Timestamp Insertion on an Interface**

19.1.8.1 **TAP Aggregation Keyframe Generation**

Keyframes contain routable IP packets that provide information to relate timestamps with the complete ASIC counter and absolute UTC time. The switch supports a maximum of ten keyframes, which are distinguished by their name label. Each keyframe can egress from every Ethernet port.

Keyframe generation is enabled by the **platform fm6000 keyframe** command. Command options specify ports that transmit keyframes along with the destination MAC address and IP address in the keyframe’s header. Other keyframe commands specify the transmission rate and the frame’s source:
• the `platform fm6000 keyframe rate` command configures the keyframe’s transmission rate.
• the `platform fm6000 keyframe source` command configures the source IP address that is placed in each keyframe’s header. The management interface IP address is the default source address.

The source MAC address is the MAC address of the egress interface transmitting the keyframe.
• the `platform fm6000 keyframe device` command configures the 16-bit number that keyframes list as the device ID in their payload.
• the `platform fm6000 keyframe fields skew` command enables the inclusion of clock skew fields in the keyframe.
• the `show platform fm6000 keyframe` command displays keyframe configuration information.

### Examples

- This command enables the generation of a keyframe named “key-1” and configures it to egress from Ethernet interfaces 11 through 15 with a source IP address of 10.21.1.4 and a MAC address of 10.4E21.9F11.

  ```
  switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
  switch(config)#
  ```

- This command configures the generation rate for the keyframe of 10 frames per second on each of the five interfaces that it is configured to egress.

  ```
  switch(config)#platform fm6000 keyframe key-1 rate 10
  switch(config)#
  ```

- This command enables the generation of a keyframe named “key-1” and configures 100 as the value that is placed in the keyframe’s device ID field.

  ```
  switch(config)#platform fm6000 keyframe key-1 device 100
  switch(config)#
  ```

- This command enables the inclusion of clock skew fields in the keyframe named “key-1.”

  ```
  switch(config)#platform fm6000 keyframe key-1 fields skew
  switch(config)#
  ```

- This command displays configuration information for keyframe “key-1.”

  ```
  switch(config)#show platform fm6000 keyframe
  Keyframe key-1
  ------------------------
  Egress Interface(s): Ethernet11, Ethernet12, Ethernet13, Ethernet14, Ethernet15
  Source IP: 172.22.30.142
  Destination IP: 10.21.1.4
  Destination MAC: 00:10:4e:21:9f:11
  Device ID: 100
  Rate: 10 packet(s) per second
  ```
19.1.8.2 Enabling Timestamp Insertion on an Interface

Timestamps are based on a frame’s ingress time and applied to frames sent on egress ports, ensuring that timestamps on monitored traffic reflect ingress timing of the original frames. Time-stamping is configured on the egress port where the timestamp is applied to the frame.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware when the packet arrived at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The `mac timestamp` command enables time-stamping on the configuration-mode interface. The switch supports two timestamp modes, which differ in managing the egress frame’s 32-bit frame check sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

### Examples

- These commands enable timestamping in before-fcs mode on Ethernet interface 44.

```text
switch(config)#interface ethernet 44
switch(config-if-Et44)#mac timestamp before-fcs
switch(config-if-Et44)#show active
interface Ethernet44
  mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on Ethernet interface 44.

```text
switch(config-if-Et44)#no mac timestamp
switch(config-if-Et44)#show active
interface Ethernet44
switch(config-if-Et44)#
```
19.1.9 TAP Aggregation Commands

Global Configuration Commands

- platform fm6000 keyframe
- platform fm6000 keyframe device
- platform fm6000 keyframe fields skew
- platform fm6000 keyframe rate
- platform fm6000 keyframe source
- platform sand multicast replication default
- platform sand multicast replication ingress maximum
- tap aggregation

Interface Configuration Commands

- mac timestamp
- switchport tap allowed vlan
- switchport tap default group
- switchport tap identity
- switchport tap native vlan
- switchport tap truncation
- switchport tool allowed vlan
- switchport tool group
- switchport tool identity
- switchport tool truncation

Tap Aggregation Configuration Mode

- mode (tap-agg configuration mode)
- mode exclusive no-errdisable (tap-agg configuration mode)

Tap Aggregation Traffic Steering

- class (policy-map (tapagg))
- class-map type tapagg
- match (class-map (tapagg))
- match (policy-map (tapagg))
- policy-map type tapagg
- resequence (class-map (tapagg))
- resequence (policy-map (tapagg))
- service-policy type tapagg (Interface mode)
- set (policy-map-class (tapagg))

Display Commands EXEC Mode

- show hardware tcam profile
- show interfaces tap
- show interfaces tool
- show platform fm6000 keyframe
- show platform sand mcast capacity
- show tap aggregation groups
19.1.9.1  class (policy-map (tapagg))

The `class (policy-map (tapagg))` command places the switch in policy-map-class (TAPagg) configuration mode, which is a group-change mode that defines a TAP aggregation class by associating the class’s eponymous class-map to a `set` statement. Upon exiting the policy-map-class mode, the class is placed in the policy-map as specified by an assigned sequence number.

A policy map is an ordered list of classes and match rules. Each class contains a class map, a `set` command, and a sequence number:

- The class map identifies a data stream by using an ordered list of ACLs. Class maps are configured in class-map (tapagg) configuration mode. Data packets are managed by commands of the highest priority class or rule that matches the packet.
- `set` commands specify the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- Sequence numbers specify the class’s priority within the policy map. Lower sequence numbers denote higher priority.

The `exit` command returns the switch to policy-map configuration mode. However, saving policymap-class changes also requires an exit from policy-map mode. This saves all pending policy map and policy-map-class changes to `running-config` and returns the switch to global configuration mode. The `abort` command discards pending changes and returns the switch to global configuration mode.

The `no class` and `default class` commands remove the class assignment from the configuration mode policy map by deleting the corresponding class configuration from `running-config`.

Command Mode

Policy-Map (tapagg) Configuration accessed through `class (policy-map (tapagg))`

Command Syntax

```
[SEQ_NUM] class class_name
default [SEQ_NUM] class class_name
no [SEQ_NUM] class class_name
```

Parameters

- `SEQ_NUM` priority of the class within the policy map. Lower numbers denote higher priority.
- `<no parameter>` number is derived by adding 10 to number of the map’s last class or rule.
- `1 to 4294967295` number assigned to class.
- `class_name` name of the class.

Guidelines

When a class is not associated with a `set (policy-map-class (tapagg))` command, the filtered traffic is managed as specified by the TAP port’s default aggregation group.

Commands Available in Policy-map-class (tapagg) Configuration Mode

- `set (policy-map-class (tapagg))` assigns VLAN identity tag or tap aggregation group to class.
- `exit` returns the switch to parent policy map configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.

Related Commands

- `class (policy-map (tapagg))` places the switch in policy-map (tapagg) configuration mode.
- `match (policy-map (tapagg))` assigns a match rule to a TAP aggregation policy map.

Example
These commands place the switch in policy-map-class and add the `t-class_1` class map to the `tpolicy_1` policy map. Packets filtered by the class map are identity tagged with VLAN 444.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
10 class t-class_1
set id-tag 444
```

These commands place the switch in policy-map-class to add the t-class_1 class map to the t-policy_1 policy map. The first, second, or both of the 2 outer-most VLAN tags are stripped.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-t-policy_1-t-class_1)#set aggregation-group t-group
   remove dot1q outer 1-2
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
   id-tag 10
switch(config-pmap-c-t-policy_1-t-class_1)#set id-tag 10 remove dot1q outer 1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group
   id-tag 10 remove dot1q outer 1-2
```
19.1.9.2 \textbf{class-map type tapagg}

The \texttt{class-map type tapagg} command places the switch in class-map (tapagg) configuration mode, which is a group change mode that modifies a tapagg class map. A tapagg class map is a data structure that uses access control lists (ACLs) to define a data stream by specifying characteristics of data packets that comprise the stream. Tapagg policy maps use class maps to specify traffic that is managed by policy map criteria.

The \texttt{exit} command saves pending class map changes to \texttt{running-config}, then returns the switch to global configuration mode. Class map changes are also saved by entering a different configuration mode. The \texttt{abort} command discards pending changes and returns the switch to global configuration mode.

The \texttt{no class-map type tapagg} and \texttt{default class-map type tapagg} commands delete the specified class map by removing the corresponding class-map type qos command and its associated configuration.

\textbf{Command Mode}

Global Configuration

\textbf{Command Syntax}

- \texttt{class-map type tapagg match-any class\_name}
- \texttt{no class-map type tapagg match-any class\_name}
- \texttt{default class-map type tapagg match-any class\_name}

\textbf{Parameters}

- \texttt{class\_name} name of class map.

\textbf{Commands Available in Class-Map (tapagg) Configuration Mode}

- \texttt{match (class-map (tapagg))}
- \texttt{resequence (class-map (tapagg))}

\textbf{Related Commands}

- \texttt{class (policy-map (tapagg))}

\textbf{Example}

This command creates a TAP aggregation class map named \texttt{t-class\_1} and places the switch in class-map configuration mode.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#
```
19.1.9.3  mac timestamp

The **mac timestamp** command enables timestamping on the configuration mode interface.

When timestamping is enabled on an egress interface, packets leave the interface with timestamps that were applied in hardware upon arriving at the switch. This is facilitated by applying a hardware timestamp to all frames arriving on all interfaces when timestamping is enabled on any interface, then removing timestamps on packets egressing interfaces where timestamping is not enabled.

The switch supports two timestamp modes, which differ in managing the egress frame’s 32-bit frame check sequence (FCS):

- **before-fcs**: the switch discards the original FCS, appends the ingress timestamp at the end of the frame data, recalculates a new FCS based on the appended timestamp, then appends the new FCS to the end of the frame. This creates a valid Ethernet frame but does not update headers of any nested protocols.
- **replace-fcs**: the switch replaces the original FCS with the timestamp. This mode maintains the size of the original frame without any latency impact, but the FCS is not valid.

The `no mac timestamp` and `default mac timestamp` commands restore the default behavior of disabling timestamping on the configuration mode interface by removing the corresponding `mac timestamp` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
mac timestamp TS_PROPERTY
```

**Parameters**

- **TS_PROPERTY** specifies the timestamp insertion mode. Options include:
  - **before-fcs** the ingress timestamp is appended to the frame and the FCS is recalculated.
  - **replace-fcs** the ingress timestamp replaces the original FCS.

**Examples**

- These commands enable timestamping in before-fcs mode on Ethernet interface 44.

```
switch(config)#interface ethernet 44
switch(config-if-Et44)#mac timestamp before-fcs
switch(config-if-Et44)#show active
interface Ethernet44
  mac timestamp before-fcs
switch(config-if-Et44)#
```

- These commands disable timestamping on Ethernet interface 44.

```
switch(config-if-Et44)#no mac timestamp
switch(config-if-Et44)#show active
interface Ethernet44
switch(config-if-Et44)#
```
19.1.9.4  match (class-map (tapagg))

The `match` command adds an ACL to the configuration-mode class map and associates a sequence number to the ACL. A class map is an ordered list of ACLs that define a data stream; the sequence number specifies an ACL’s priority within the list. A class map is used by policy maps to filter data packets. Tapagg class maps utilize ACL permit rules to pass packets and deny rules to drop packets.

Class map (tapagg) configuration mode is a group change mode. `Match` statements are not saved to `running-config` until the edit session is completed by exiting the mode.

The `no match` and `default match` commands remove the specified `match` statement from the configuration-mode class map by deleting the corresponding `match` command from `running-config`.

**Command Mode**

Class-map (tagagg) Configuration accessed through `class-map type tapagg` command.

**Command Syntax**

```
[SEQ_NUM] match ip access-group list_name
no SEQ_NUM] match ip access-group list_name
default SEQ_NUM] match ip access-group list_name
```

**Parameters**

- SEQ_NUM sequence number assigned to the ACL. Options include:
  - `<no parameter>` number is derived by adding 10 to the number of the map's last ACL.
  - `1 to 4294967295` number assigned to ACL.
- `list_name` name of ACL assigned to class map.

**Guidelines**

`match` statements accept IPv4 ACLs.

**Related Commands**

- `class-map type tapagg` places the switch in Class-Map configuration mode.
- `exit` saves pending class map changes, then returns the switch to global configuration mode.
- `abort` discards pending class map changes, then returns the switch to global configuration mode.
- `class (policy-map (tapagg))` assigns a class map to a policy map.

**Example**

These commands add two IPv4 ACLs (“tacl-1” and “tacl-2”) to the “t-class_1” class map, save the command by exiting class-map mode, and re-enter the mode to display the added ACLs.

```
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#match ip access-group tacl-1
switch(config-cmap-t-class_1)#match ip access-group tacl-2
switch(config-cmap-t-class_1)#exit
switch(config)#class-map type tapagg match-any t-class_1
switch(config-cmap-t-class_1)#show active
  class-map type tapagg match-any t-class_1
    10 match ip access-group tacl-1
    20 match ip access-group tacl-2
switch(config-cmap-t-class_1)#
```
19.1.9.5 match (policy-map (tapagg))

The `match` command adds a rule to the configuration-mode TAP aggregation policy map. A policy map is an ordered list of classes and rules. Each rule contains a filter list, an action, and a sequence number:

- The filter list identifies a data stream through a set of packet field values.
- The action, *(SET_VALUE parameter)* specifies the replication method of filtered data packets, either through an associated aggregation group or identity VLAN tagging.
- The sequence number specifies the rule’s priority within the policy map.

The `no match` and `default match` commands remove the `match` rule from the configuration-mode policy by deleting the corresponding statement from `running-config`.

Command Mode

Policy-Map (tapagg) Configuration accessed through `class (policy-map (tapagg))`.

Command Syntax

```
[SEQ_NUM] match [VLAN_TAG] SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log] SET_VALUE

no match [VLAN_TAG] SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log] SET_VALUE

default match [VLAN_TAG] SOURCE_ADDR [SOURCE_PORT] DEST_ADDR [DEST_PORT] [PROTOCOL] [FLAGS] [MESSAGE] [fragments] [tracked] [DSCP_FILTER] [TTL_FILTER] [log] SET_VALUE
```

**Note:** Commands use a subset of the listed fields. Available parameters depend on specified protocol. Use CLI syntax assistance to view options for specific protocols when creating a permit rule.

Parameters

- **SEQ_NUM** priority of the rule within the policy map. Lower numbers denote higher priority.
  - `<no parameter>` number derived by adding 10 to number of the map’s last class or rule.
  - `<1 to 4294967295>` number assigned to class.
- **VLAN_TAG** VLAN field filter. Options include:
  - `<no parameter>` packets are not filtered by VLAN field.
  - `vlan <1 to 4094> <0 to 4095>` VLAN ID and mask.
  - `vlan inner <1 to 4094> <0 to 4095>` inner VLAN ID and mask.
- **PROTOCOL** protocol field filter. Values include:
  - `<no parameter>` packets are not filtered by host name.
  - `ahp authentication header protocol (51).`
  - `icmp internet control message protocol (1).`
  - `igmp internet group management protocol (2).`
  - `ospf open shortest path first (89).`
  - `pim protocol independent multicast (103).`
  - `tcp transmission control protocol (6).`
  - `udp user datagram protocol (17).`
  - `vrrp virtual router redundancy protocol (112).`
  - `protocol_num integer corresponding to an IP protocol. Values range from 0 to 255.`
• SOURCE_ADDR and DEST_ADDR source and destination address filters. Options include:
  • network_addr subnet address (CIDR or address-mask).
  • any packets from all addresses are filtered.
  • host ip_addr IP address (dotted decimal notation).

  Source and destination subnet addresses support discontiguous masks.
• SOURCE_PORT and DEST_PORT source and destination port filters. Options include:
  • any all ports.
  • eq port-1 port-2 ... port-n a list of ports. Maximum list size is 10 ports.
  • neq port-1 port-2 ... port-n the set of all ports not listed. Maximum list size is 10 ports.
  • gt port the set of ports with larger numbers than the listed port.
  • lt port the set of ports with smaller numbers than the listed port.
  • range port_1 port_2 the set of ports whose numbers are between the range.
• fragments filters packets with FO bit set (indicates a non-initial fragment packet).
• FLAGS flag bit filters (TCP packets). Use CLI syntax assistance (?) to display options.
• MESSAGE message type filters (ICMP packets). Use CLI syntax assistance (?) to display options.
• tracked rule filters packets in existing ICMP, UDP, or TCP connections.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.
• DSCP_FILTER rule filters packet by its DSCP value. Values include:
  • <no parameter> rule does not use DSCP to filter packets.
  • dscp dscp_value packets match if DSCP field in packet is equal to dscp_value.
• TTL_FILTER rule filters packet by its TTL (time-to-live) value. Values include:
  • <no parameter> rule does not use TTL field to filter packets.
  • ttl eq ttl_value packets match if ttl in packet is equal to ttl_value.
  • ttl gt ttl_value packets match if ttl in packet is greater than ttl_value.
  • ttl lt ttl_value packets match if ttl in packet is less than ttl_value.
  • ttl neq ttl_value packets match if ttl in packet is not equal to ttl_value.
  • log triggers an informational log message to the console about the matching packet.
  • Valid in ACLs applied to the control plane.
  • Validity in ACLs applied to data plane varies by switch platform.
• SET_VALUE specifies the replication method for filtered packets.
  • set aggregation group agg_group replication specified by aggregation group.
  • set id-tag <1 to 4094> packet is identity tagged with specified VLAN number.
  • set aggregation group agg_group id-tag <1 to 4094> assigns agg group and identity tag.

Related Commands
• policy-map type tapagg places the switch in policy-map (tapagg) configuration mode.
• class (policy-map (tapagg)) assigns a class to the configuration-mode policy map.

Example
This command creates a match rule for the “t-policy_1” policy map that filters OSPF packets and
replicates them as specified by the “t-group” tap aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#match ip ospf any any set aggregation-group t-group
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
```
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
switch(config-pmap-t-policy_1)#
19.1.9.6  mode (tap-agg configuration mode)

The *mode* command configures the switch’s TAP aggregation mode. The *mode exclusive* command enables TAP aggregation. When TAP aggregation is enabled, TAP and tool ports are enabled, switching mode is disabled, and switching ports are errdisabled. TAP aggregation is disabled by default.

The *no mode* and *default mode* commands disable TAP aggregation mode and enable switching mode by removing the *mode* command from *running-config*.

**Command Mode**

TAP Aggregation Configuration

**Command Syntax**

```
mode exclusive
no mode exclusive
default mode exclusive
```

**Parameters**

exclusive TAP aggregation is enabled.

**Related Command**

*tap aggregation* places the switch in TAP-aggregation configuration mode.

**Examples**

- These commands place the switch in TAP-aggregation configuration mode, enable TAP aggregation mode, and display the results.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#show active
tap aggregation
    mode exclusive
switch(config-tap-agg)#
```

- These commands disable TAP-aggregation mode by removing the *mode* command from *running-config*, then display the results.

```
switch(config)#tap aggregation
switch(config-tap-agg)#no mode
switch(config-tap-agg)#show active
switch(config-tap-agg)#
```
19.1.9.7 mode exclusive no-errdisable (tap-agg configuration mode)

The `mode exclusive no-errdisable` command configures the specified interface to remain enabled, regardless of its switchport mode, when TAP aggregation is enabled. This command is used primarily to configure a port to support PTP functions while the switch operates as a TAP aggregator.

Each command configures one Ethernet or port-channel interface. Subsequent `mode exclusive no-errdisable` commands add to the list of ports that remain enabled when TAP aggregation is enabled.

The `no mode exclusive no-errdisable` and `default mode exclusive no-errdisable` commands configure the specified interface to be error-disabled when programmed in access, trunk, or dot1q-tunnel switching mode (when TAP aggregation is enabled) by removing the corresponding `mode exclusive no-errdisable` command from `running-config`.

**Command Mode**
TAP Aggregation Configuration

**Command Syntax**

```
mode exclusive no-errdisable INT_NAME
```

**Parameters**

- `INT_NAME` interface type and number. Options include:
  - `ethernet e_num` Ethernet interface specified by `e_num`.
  - `port-channel p_num` port-channel interface specified by `p_num`.

**Related Commands**

- `tap aggregation` places the switch in TAP-aggregation configuration mode.
- `mode (tap-agg configuration mode)` configures the switch’s TAP-aggregation mode.

**Guidelines**

In order for a TAP-aggregation switch to receive PTP traffic, the upstream device to which it is connected should be set to statically send PTP multicast traffic to the connected port on the switch.

Since IGMP snooping is disabled on TAP-aggregation switches and with no configuration to support sending upstream join messages in such a state, the messages are transmitted statically from the upstream device. Once the upstream messages are received, the port will move to the slave state and follow the standard PTP mechanism.

**Example**

These commands place the switch in TAP-aggregation configuration mode and place Ethernet interface 21/3 in no-errdisable mode.

```
switch(config)#tap aggregation
switch(config-tap-agg)#mode exclusive
switch(config-tap-agg)#mode exclusive no-errdisable ethernet 21/4
switch(config-tap-agg)#
```
19.1.9.8  platform fm6000 keyframe device

The platform fm6000 keyframe device command configures the 16-bit number that the specified keyframe lists as the device ID in its payload. By default, the device value placed in the specified keyframes is 0.

The no platform fm6000 keyframe device and default platform fm6000 keyframe device commands restore the default device ID insertion value of 0 for the specified keyframe by removing the corresponding platform fm6000 keyframe device command from running-config. The no platform fm6000 keyframe and default platform fm6000 keyframe command also removes the corresponding platform fm6000 keyframe device command from running-config.

Command Mode
Global Configuration

Command Syntax
platform fm6000 keyframe kf_name device device_id
no platform fm6000 keyframe kf_name device
default platform fm6000 keyframe kf_name device

Parameters
• kf_name keyframe name.
• device_id value inserted in keyframe’s device ID field. Values range from 0 to 65535. Default is 0.

Example
These commands enable the generation of a keyframe named “key-1,” then configure 100 as the value that is placed in the keyframe’s device ID field.

switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 device 100
switch(config)#
19.1.9.9 platform fm6000 keyframe fields skew

Keyframes may optionally include skew numerator and skew denominator fields. These skew fields form a ratio indicating the ASIC clock skew. If the ratio is greater than 1, the clock is skewed fast; if the ratio is less than 1, the clock is skewed slow. Clock skew fields are omitted by default.

The platform fm6000 keyframe fields skew command enables the inclusion of clock skew fields in the keyframe.

The no platform fm6000 keyframe fields skew and default platform fm6000 keyframe fields skew commands remove the clock skew fields from the keyframe.

Command Mode
Global Configuration

Command Syntax
platform fm6000 keyframe kf_name fields skew

Parameters
kf_name keyframe name.

Example
This command enables the inclusion of clock skew fields in the keyframe named “key-1.”

switch(config)#platform fm6000 keyframe key-1 fields skew
switch(config)#
19.1.9.10 platform fm6000 keyframe rate

The `platform fm6000 keyframe rate` command specifies the transmission rate for the specified keyframe from each interface from which it is configured to egress. By default, one keyframe is sent per second.

The `no platform fm6000 keyframe rate` and `default platform fm6000 keyframe rate` commands restore the default transmission rate for the specified keyframe of one per second by removing the corresponding `platform fm6000 keyframe rate` command from `running-config`. The `no platform fm6000 keyframe` and `default platform fm6000 keyframe` command also removes the corresponding `platform fm6000 keyframe rate` command from `running-config`.

Command Mode
Global Configuration

Command Syntax

```
platform fm6000 keyframe kf_name rate tx_rate
```

Parameters

- `kf_name` the keyframe’s name.
- `tx_rate` keyframe transmission rate (frames per second). Values range from 1 to 100. Default value is 1.

Example

These commands enable the generation of a keyframe named “key-1,” then configure the generation rate for the keyframe of 10 frames per second on each of the five interfaces that it is configured to egress.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 rate 10
switch(config)#
```
19.1.9.11  platform fm6000 keyframe source

The platform fm6000 keyframe source command configures the source IP address that the specified keyframe lists in its IP header. By default, keyframes use the IP address of the management interface as their source address.

The no platform fm6000 keyframe source and default platform fm6000 keyframe source commands restore the management interface IP address as the specified keyframe’s source IP address by removing the corresponding platform fm6000 keyframe source command from running-config. The no platform fm6000 keyframe and default platform fm6000 keyframe command also removes the corresponding platform fm6000 keyframe source command from running-config.

Command Mode
Global Configuration

Command Syntax
platform fm6000 keyframe kf_name source ip ipv4_addr
no platform fm6000 keyframe
kf_name source ip
default platform fm6000 keyframe kf_name source ip

Parameters
• kf_name keyframe’s name.
• ipv4_addr keyframe’s source IPv4 address (dotted decimal notation).

Example
These commands enable the generation of a keyframe named “key-1,” then sets the keyframe source IP address to 10.1.1.101.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#platform fm6000 keyframe key-1 source 10.1.1.101
switch(config)#
```
19.1.9.12  platform fm6000 keyframe

The `platform fm6000 keyframe` command enables keyframe generation for data streams transmitted from specified ethernet interfaces. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with absolute UTC time and the switch’s complete ASIC time counter.

The switch supports a maximum of ten keyframes. The keyframe name is the label that distinguishes different keyframes. Each keyframe can egress from every ethernet port. Command options specify the destination MAC address and IP address in the keyframe’s header. Other keyframe commands specify the transmission rate and the frame’s source.

The `no platform fm6000 keyframe` and `default platform fm6000 keyframe` commands disable generation of the specified keyframe by deleting the corresponding platform fm6000 keyframe command from `running-config`. These command also remove all supporting `platform fm6000 keyframe` commands for the specified keyframe.

**Command Mode**

Global Configuration

**Command Syntax**

```
platform fm6000 keyframe kf_name interface ethernet e_range ipv4_addr mac_addr
no platform fm6000 keyframe kf_name
default platform fm6000 keyframe kf_name
```

**Parameters**

- `kf_name` the keyframe’s name.
- `e_range` Ethernet interface range over which the keyframe egresses. Valid formats include number, range, or comma-delimited list of numbers and ranges.
- `ipv4_addr` destination IPv4 address inserted into keyframes (dotted decimal notation).
- `mac_addr` destination MAC address inserted into keyframes (48-bit dotted hex notation).

**Guidelines**

Subsequent issuance of this command for a specified keyframe replaces the existing command in `running-config`. Ethernet interfaces are inserted into an existing keyframe only by issuing the complete command that identifies all interfaces through which the keyframe is transmitted.

**Example**

This command enables the generation of a keyframe named “key-1.” This keyframe egresses from Ethernet interfaces 11 through 15 and specifies a source IP address of 10.21.1.4 and a MAC address of 10.4E21.9F11.

```
switch(config)#platform fm6000 keyframe key-1 interface ethernet 11-15 10.21.1.4 10.4E21.9F11
switch(config)#
```
The platform sand multicast replication default command configures the default replication mode on Sand platform switches. The factory default replication mode differs in various scenarios as follows:

- The default replication mode on switches with fabric is fabric-egress mode.
- The default replication mode on switches with single Fabric Access Processor (FAP) systems is ingress mode.
- The default replication mode on switches without fabric barring single FAP systems is ingress-egress mode.
- If a tool group with less than 60 LAGs has at least one hardware LAG, then the default replication mode of the tool group is ingress-only mode. Else the default replication mode of the tool group is the one configured across all LAGs in the tool group.

The default platform sand multicast replication default and no platform sand multicast replication default commands revert the current state to the factory default behavior.

**Command Mode**
Global Configuration

**Command Syntax**

```
platform sand multicast replication default {fabric-egress | ingress}
no platform sand multicast replication default
default platform sand multicast replication default
```

**Parameters**

- fabric-egress configures the replication mode to use fabric-egress VoQ buffers.
- ingress configures the replication mode to use ingress VoQ buffers.

**Guidelines**
This command is supported on Sand platforms only.

**Related Commands**

- platform sand multicast replication ingress maximum
- show platform sand mcast capacity

**Example**

This command configures the default replication mode to ingress.

```
switch(config)#platform sand multicast replication default ingress
```

switch(config)#
19.1.9.14 platform sand multicast replication ingress maximum

The `platform sand multicast replication ingress maximum` command configures maximum members for ingress-only replication.

The `default platform sand multicast replication ingress maximum` command reverts the maximum members for ingress-only replication to the default value.

The `no platform sand multicast replication ingress maximum` command deletes the maximum member value for ingress-only replication.

**Command Mode**
Global Configuration

**Command Syntax**

platform sand multicast replication ingress maximum *max_value*

no platform sand multicast replication ingress maximum
default platform sand multicast replication ingress maximum

**Parameters**

*max_value* specifies the maximum number of members for ingress-only replication. Values range from 1 to 64. The default value is 64.

⚠️  **Note:** *max_value* for a single FAP Jericho system ranges from 1 to 4096.

**Guidelines**

This command is supported on Sand platforms only.

**Related Commands**

- `platform sand multicast replication default`
- `show platform sand mcast capacity`

**Example**

This command specifies a maximum of sixty-three members for ingress-only replication.

```
switch(config)# platform sand multicast replication ingress maximum 63
switch(config)#
```
19.1.9.15  policy-map type tapagg

The `policy-map type tapagg` command places the switch in policy-map (tapagg) configuration mode, which is a group-change mode that modifies a TAP-aggregation policy map. A TAP-aggregation policy map is a data structure that consists of class maps and match statements that filter a specific data stream. Packets in that data stream are either managed as specified by a TAP aggregation group or modified to add a VLAN identity tag. Policy maps manage traffic when applied to an Ethernet or port-channel interface.

The `exit` command saves pending policy map changes to `running-config` and returns the switch to global configuration mode. Policy map changes are also saved by entering a different configuration mode. The `abort` command discards pending changes, returning the switch to global configuration mode.

The `no policy-map type tapagg` and `default policy-map type tapagg` commands delete the specified policy map by removing the corresponding `policy-map type tapagg` command and the associated policy map statements from `running-config`.

Command Mode
Global Configuration

Command Syntax

```plaintext
policy-map type tapagg map_name
no policy-map type tapagg map_name
default policy-map type tapagg map_name
```

Parameters

`map_name` name of policy map.

Commands Available in Policy-Map Configuration Mode

- `class (policy-map (tapagg))`
- `match (policy-map (tapagg))`

Related Commands

- `class-map type tapagg`
- `service-policy type tapagg (Interface mode)`

Example

This command creates the TAP-aggregation policy map named “t-policy_1” and places the switch in policy-map configuration mode.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#
```
19.1.9.16  resequence (class-map (tapagg))

The `resequence` command assigns sequence numbers to access control lists (ACLs) in the configuration mode TAP-aggregation class map. Sequence numbers denote an ACL's priority within the class map. Command parameters specify the number of the first ACL and the numeric interval between consecutive ACLs.

Maximum rule sequence number is 4294967295.

Command Mode

Class-map (tagagg) Configuration

accessed with the `class-map type tapagg` command

Command Syntax

`resequence [start_num [inc_num]]`

Parameters

- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

Example

These commands display a policy map whose entities were entered with default sequence numbers, then renumber the contents.

```
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
  20 class fred
    set aggregation-group t-group id-tag 444
  30 class t-class_2
    set id-tag 500
  40 class t-class_3
    set id-tag 600
  50 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  100 match ip ospf any any set aggregation-group t-group
  120 class fred
    set aggregation-group t-group id-tag 444
  140 class t-class_2
    set id-tag 500
  160 class t-class_3
    set id-tag 600
  180 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#
```
19.1.9.17 resequence (policy-map (tapagg))

The `resequence` command assigns sequence numbers to classes and rules in the configuration mode TAP-aggregation policy map. Sequence numbers denote the priority of a class or rule within the policy map. Command parameters specify the number of the first policy map entity and the numeric interval between consecutive entities.

Maximum rule sequence number is 4294967295.

**Command Mode**
Policy-Map (tapagg) Configuration accessed with the `class (policy-map (tapagg))` command

**Command Syntax**
```
resequence [start_num [inc_num]]
```

**Parameters**
- `start_num` sequence number assigned to the first rule. Default is 10.
- `inc_num` numeric interval between consecutive rules. Default is 10.

**Example**
These commands display a policy map whose entities were entered with default sequence numbers, then use the `resequence` command to renumber the contents.

```bash
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 match ip ospf any any set aggregation-group t-group
  20 class fred
    set aggregation-group t-group id-tag 444
  30 class t-class_2
    set id-tag 500
  40 class t-class_3
    set id-tag 600
  50 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#resequence 100 20
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  100 match ip ospf any any set aggregation-group t-group
  120 class fred
    set aggregation-group t-group id-tag 444
  140 class t-class_2
    set id-tag 500
  160 class t-class_3
    set id-tag 600
  180 class t-class_4
    set id-tag 700
switch(config-pmap-t-policy_1)#
```
19.1.9.18 service-policy type tapagg (Interface mode)

The `service-policy type tapagg` command applies a specified TAP-aggregation policy map to the configuration-mode interface. A policy map is a data structure that identifies data traffic through class maps and match rules, then specifies the method of replicating the traffic. This command is active only when TAP aggregation mode is enabled on the switch.

The `no service-policy type tapagg` and `default service-policy type tapagg` commands remove the policy map assignment from the configuration mode interface by deleting the corresponding `service-policy tapagg` command from `running-config`.

Command Mode
Interface-Ethernet Configuration
Interface-Port-Channel Configuration

Command Syntax
`service-policy type tapagg input policymap_name`

Parameters
- `input` policy map applies to inbound packet streams. This is the only option.
- `map_name` name of policy map.

Guidelines
A policy map that is attached to a port-channel interface takes precedence for member interfaces of the port channel over their individual Ethernet interface configuration. Members that are removed from a port channel revert to the policy-map implementation specified by its Ethernet interface configuration.

Related Commands
`class (policy-map (tapagg))` places the switch in policy-map configuration mode to create a policy map.

Example
These commands apply the "t-policy_1" policy map to Ethernet interface 17.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#service-policy type tapagg input t-policy_1
switch(config-if-Et17)#
```
The `set` command specifies the data replication method for traffic filtered by the associated class map in the configuration-mode policy map. The `set` command specifies one of these replication actions for filtered data packets:

- specifies an aggregation group.
- specifies a VLAN identity tag for replicated packets.
- specifies an aggregation group and a VLAN identity tag.

The `no set` and `default set` commands remove the specified set command data action from the configuration-mode class by deleting the associated `set` command from `running-config`.

**Command Mode**

Policy-map-class (tapagg) Configuration

accessed using the `class (policy-map (tapagg))` command

**Command Syntax**

- `set SET_VALUE`
- `no set SET_VALUE`
- `default set SET_VALUE`

**Parameters**

- `SET_VALUE` specifies the replication method for filtered packets. Options include:
  - aggregation group `agg_group` replication specified by aggregation group.
  - id-tag `VLAN_number` packet is identity tagged with specified VLAN number. VLAN numbers range from 1 to 4094.
  - aggregation group `agg_group` id-tag `VLAN_number` assigns aggregation group and identity tag (VLAN number). VLAN numbers range from 1 to 4094.

**Related Commands**

- `policy-map type tapagg` places the switch in policy-map (tapagg) configuration mode.
- `class (policy-map (tapagg))` assigns a class to the policy-map configuration mode.
- `match (policy-map (tapagg))` assigns a rule to the policy-map configuration mode.

**Guidelines**

When a class is not associated with a `set` command, the filtered traffic is managed as specified by the TAP port’s default aggregation group.

**Example**

These commands place the switch in policy-map-class to add the “t-class_1” class map to the “t-policy_1” policy map. Packets filtered by the class map are identity tagged with VLAN 444 and replicated as specified through the “t-group” aggregation group.

```
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#class t-class_1
switch(config-pmap-c-t-policy_1-t-class_1)#set aggregation-group t-group id-tag 444
switch(config-pmap-c-t-policy_1-t-class_1)#exit
switch(config-pmap-t-policy_1)#exit
switch(config)#policy-map type tapagg t-policy_1
switch(config-pmap-t-policy_1)#show active
policy-map type tapagg t-policy_1
  10 class t-class_1
    set aggregation-group t-group id-tag 444
```
switch(config-pmap-t-policy_1)#
show hardware tcam profile

Use the `show hardware tcam profile` command to display the TCAM profile by configuration and status.

**Command Mode**
EXEC

**Command Syntax**
`show hardware tcam profile detail`

**Parameters**
detail Displays TCAM profile details.

**Example**
```
(config-tap-agg)#show hardware tcam profile

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>FixedSystem foo*</td>
<td>foo</td>
</tr>
</tbody>
</table>
* configuration overridden by TapAgg
```
19.1.9.21 show interfaces tap

The `show interfaces tap` command displays TAP-port configuration information for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

```
show interfaces [INTERFACE] tap [INFO_LEVEL]
```

**Parameters**

- **INTERFACE** interface type and numbers. Options include:
  - `<no parameter>` all interfaces.
  - `ethernet e_range` Ethernet interface range specified by `e_range`.
  - `management m_range` management interface range specified by `m_range`.
  - `port-channel p_range` port-channel interface range specified by `p_range`.

  Valid `e_range`, `m_range`, and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO_LEVEL** amount of information that is displayed. Options include:
  - `<no parameter>` command displays table that summarizes TAP data.
  - `detail` command displays TAP data summary table and a list of ACLS applied to TAP ports.

**Examples**

- This command displays TAP-port configuration information for Ethernet interfaces 36 through 40.

```
switch# show interface ethernet 31-35 tap
Port      Configured     Status         Native   Id   Truncation
Default   Mode                          Vlan     Vlan            Group
-----------------------------------------------------------------------
Et31      tap            tap            301      31   0          tag_1
Et32      tap            tap            1        132  0          tag_1
Et33      tap            tap            303      233  0          tag_1
Et34      tap            tap            1        334  0          tag_3
Et35      tap            tap            1        345  0          tag_3
switch#
```

- This command displays detailed TAP-port configuration information for Ethernet interface 31.

```
switch# show interface ethernet 31 tap detail
Port      Configured     Status         Native   Id   Truncation
Default   Mode                          Vlan     Vlan            Group
-----------------------------------------------------------------------
Et31      tap            tap            301      31   0          tag_1
Port      ACLs Applied
------------------------------------------------------------------------
switch#
```
19.1.9.22  show interfaces tool

The show interfaces tool command displays tool port configuration information for the specified interfaces.

**Command Mode**

EXEC

**Command Syntax**

`show interfaces [INTERFACE] tool`

**Parameters**

- INTERFACE interface type and numbers. Options include:
  - <no parameter> all interfaces.
  - ethernet e_range Ethernet interface range specified by e_range.
  - management m_range management interface range specified by m_range.
  - port-channel p_range port-channel interface range specified by p_range.

Valid e_range, m_range, and p_range formats include number, number range, or comma-delimited list of numbers and ranges.

**Example**

This command displays tool port configuration information for Ethernet interfaces 36 through 40.

```
switch#show interface ethernet 36-40 tool
Port     Configured   Status          Allowed             Id
         Mode          Vlans        Tag  Mode
-----------------------------------------------------------------------
Et36     tool         tool           201-205   Off  None
Et37     tool         tool           201-205   Off  None
Et38     tool         tool           201-205   Off  None
Et39     access       errdisabled    All      Off  None
Et40     tool         tool           All       On   None

switch#
```
19.1.9.23 show platform fm6000 keyframe

The `show platform fm6000 keyframe` command displays configured information for the specified keyframes. Keyframes are routable IP packets that the switch inserts into a data stream to provide contextual information that correlate timestamps inserted into data packets with the absolute UTC time and the switch’s complete ASIC time counter.

**Command Mode**
Privileged EXEC

**Command Syntax**

```
show platform fm6000 keyframe [KEYFRAME_ID]
```

**Parameters**

- **KEYFRAME_ID** specifies keyframes that the command displays. Options include:
  - `<no parameter>` command displays all configured keyframes.
  - `kf_name` specifies a single keyframe to display information for.

**Example**

This command displays information concerning the three keyframes that the switch sends.

```
switch# show platform fm6000 keyframe
Keyframe key-2
------------------------
Egress Interface(s): Ethernet17, Ethernet18, Ethernet19, Ethernet20, Ethernet21
Source IP: 10.22.30.144
Destination IP: 10.21.1.14
Destination MAC: 00:09:00:09:00:09
Device ID: 0
Rate: 5 packet(s) per second

Keyframe key-1
------------------------
Egress Interface(s): Ethernet11, Ethernet12, Ethernet13, Ethernet14, Ethernet15
Source IP: 10.22.30.146
Destination IP: 10.21.1.4
Destination MAC: 00:10:4e:21:9f:11
Device ID: 0
Rate: 2 packet(s) per second

switch#
```
show platform sand mcast capacity

The `show platform sand mcast capacity` command displays the usage details of hardware resources on Sand platform switches.

**Command Mode**

EXEC

**Command Syntax**

`show platform sand mcast capacity [threshold threshold_value]`

**Parameters**

`threshold threshold_value` displays the list of resources whose usage percentage is greater than or equal to the specified threshold value. Values range from 0 to 100. The default value is 100.

**Guidelines**

This command is supported on Sand platforms only.

**Examples**

This command displays the usage details of hardware resources on a Sand platform switch.

```
switch# show platform sand mcast capacity

switch#`
```
19.1.9.25  **show tap aggregation groups**

The **show tap aggregation groups** command displays the TAP and tool port members of the specified TAP aggregation groups.

**Command Mode**

EXEC

**Command Syntax**

show tap aggregation groups [INFO_LEVEL] [GROUP_NAMES]

**Parameters**

- **INFO_LEVEL** port information to display. Options include:
  - <no parameter> displays active TAP and tool ports.
  - detail displays all configured TAP and tool ports, including inactive ports.

- **GROUP_NAMES** TAP aggregation groups. Options include:
  - <no parameter> displays information for all TAP aggregation groups.
  - group_list displays information for the specified TAP aggregation group list.

  Valid **group_list** format is a space-delimited list of one or more TAP aggregation group names.

**Example**

This command displays the contents of all configured TAP aggregation groups.

```
switch#show tap aggregation groups
Group Name                          Tool Members
---------------------------------------------------------
analyze2                            Po101, Po102
analyze3                            Po101, Po103

Group Name                          Tap Members
---------------------------------------------------------
analyze2                            Et41, Et42
analyze3                            Et43
switch#
```
switchport tap allowed vlan

The `switchport tap allowed vlan` command creates or modifies the list of VLANs for which the configuration mode interface, in TAP mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in `running-config` without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The `no switchport tap allowed vlan` and `default switchport tap allowed vlan` commands restore the TAP mode default allowed VLAN setting of all by removing the corresponding `switchport tap allowed vlan` statement from `running-config`.

**Command Mode**

Interface-Ethernet Configuration
Interface-Port Channel Configuration

**Command Syntax**

```
switchport tap allowed vlan EDIT_ACTION
```

**Parameters**

- `EDIT_ACTION` modifications to the VLAN list. Options include:
  - `v_range` creates VLAN list from range of VLANs specified by `v_range`.
  - `add v_range` adds specified VLANs to current list.
  - `all VLAN list contains all VLANs.
  - `except v_range` VLAN list contains all VLANs except those specified by `v_range`.
  - `none VLAN list is empty (no VLANs).
  - `remove v_range` removes VLANs specified by `v_range` from current list.

Valid `v_range` formats include number (1 to 4094), range, or comma-delimited list of numbers and ranges.

**Example**

These commands create the TAP mode allowed VLAN list of 26-30 for Ethernet interface 20.

```
switch(config)#interface ethernet 20
switch(config-if-Et20)#switchport tap allowed vlan 26-30
eswitch(config-if-Et20)#show active
interface Ethernet20
  switchport mode tap
  switchport tap allowed vlan 26-30
switch(config-if-Et20)#
```
19.1.9.27  switchport tap default group

The `switchport tap default group` command assigns the configuration-mode interface to the specified tool group as a TAP port member. TAP aggregation groups associate a set of TAP ports with a set of tool ports. Both TAP ports and tool ports may belong to multiple TAP aggregation groups.

The `no switchport tap default group` and `default switchport tap default group` commands remove the configuration-mode interface from the TAP aggregation group to which it is assigned by deleting the corresponding `switchport tap default group` statement from `running-config`.

Command Mode

Interface-Ethernet Configuration

Interface-port Channel Configuration

Command Syntax

```
switchport tap default group group_name
no switchport tap default group
default switchport tap default group
```

Parameters

`group_name` tool group name.

Restriction

This command is only available on FM6000 platform switches.

Example

These commands assign port channel 101 to TAPs aggregation group “tag-1.”

```
switch(config)# interface port-channel 101
switch(config-if-Po101)# switchport tap default group tag-1
switch(config-if-Po101)# show interfaces port-channel 101 tap
Port      Configured     Status         Native   Id   Truncation Default Group
Mode                          Vlan     Vlan            Group
-----------------------------------------------------------------------
Po101     access         notconnect     1        1    0          tag-1
```

switch(config)#

3263
19.1.9.28 switchport tap identity

The `switchport tap identity` command associates a VLAN number to the configuration mode TAP interface. Tool ports that are configured to encapsulate packets with an dot1q-style tag enter the number specified by this command as the s-VLAN (tier 1) for packets received from this TAPs port. The default identity value is 1.

The `no switchport tap identity` and `default switchport tap identity` commands restore VLAN 1 as the configuration-mode port's identity VLAN by removing the corresponding `switchport tap identity` command from `running-config`.

Command Mode

Interface-Ethernet Configuration
Interface-Port Channel Configuration

Command Syntax

```
switchport tap identity port_id
no switchport tap identity
default switchport tap identity
```

Parameters

`port_id` port's identity VLAN. Values range from 1 to 4094. Default is 1.

Related Commands

`switchport tool identity` configures a tool port to encapsulate packets received from TAP ports.

Restriction

This command is available only on FM6000 platform switches.

Example

These commands 171 as the identity value for Ethernet interface 17.

```
switch(config)#interface ethernet 17
switch(config-if-Et17)#switchport tap identity 171
switch(config-if-Et17)#show active
interface Ethernet17
  switchport tap identity 171
switch(config-if-Et17)#show interfaces ethernet 17 tap

```

switch(config-if-Et17)#
19.1.9.29  switchport tap native vlan

The `switchport tap native vlan` command specifies the TAP-mode native VLAN for the configuration-mode interface. Interfaces in TAP mode associate untagged frames with the native VLAN. The default native VLAN for all interfaces is VLAN 1. Command settings persist in `running-config` without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode.

The `no switchport tap native vlan` and `default switchport tap native vlan` commands restore VLAN 1 as the TAP-mode native VLAN to the configuration-mode interface by removing the corresponding `switchport tap native vlan` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port Channel Configuration

**Command Syntax**

```
switchport tap native vlan v_num
no switchport tap native vlan
default switchport tap native vlan
```

**Parameters**

- `v_num` TAP-mode native VLAN ID. Values range from 1 to 4094. Default is 1.

**Restriction**

This command is available only on FM6000 platform switches.

**Example**

These commands assign VLAN 25 as the TAP-mode native VLAN for Ethernet interface 7.

```
switch(config)#interface ethernet 7
switch(config-if-Et7)#switchport tap native vlan 25
switch(config-if-Et7)#show interface ethernet 7 tap
Port  Configured Status  Native Id  Truncation  Default Group
Mode          Vlan Vlan
Et7   tool    connected  25   1     0          ---
```

switch(config-if-Et7)#
19.1.9.30 switchport tap truncation

The `switchport tap truncation` command configures the configuration-mode interface, as a TAP port, to truncate inbound packets to the specified packet size. This command is in effect when the port is in TAP mode and the switch is in TAP aggregation mode. Command settings persist in `running-config` without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP mode. By default, TAP ports do not truncate inbound packets.

The `no switchport tap truncation` and `default switchport tap truncation` commands restore the default behavior of not truncating packets received by the configuration-mode interface by removing the corresponding `switchport tap truncation` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port Channel Configuration

**Command Syntax**

```
switchport tap truncation packet_size
no switchport tap truncation
default switchport tap truncation
```

**Parameters**

`packet_size` size of truncated packets (bytes). Values range from 100 to 9236. Default value of 0 corresponds to not truncating packets.

**Restriction**

This command is available only on FM6000 platform switches.

**Examples**

- These commands configure Ethernet interface 38 to truncate packets to 150 bytes.

  ```
  switch(config)#interface ethernet 38
  switch(config-if-Et38)#switchport tap truncation 150
  switch(config-if-Et38)#show interface ethernet 38 tap
  Port     Configured     Status         Native   Id   Truncation
  Default                           Vlan     Vlan            Group
  Et38     access         notconnect     1        1     150        ---
  switch(config-if-Et38)#
  ```

- These commands configure Ethernet interface 38 to send complete packets to tool ports in its TAP aggregation group.

  ```
  switch(config-if-Et38)#no switchport tap truncation
  switch(config-if-Et38)#show interface ethernet 38 tap
  Port     Configured     Status         Native   Id   Truncation
  Default                           Vlan     Vlan            Group
  Et38     access         notconnect     1        1     0          ---
  switch(config-if-Et38)#
  ```
19.1.9.31 switchport tool allowed vlan

The switchport tool allowed vlan command creates or modifies the list of VLANs for which the configuration-mode interface, in tool mode, handles tagged traffic. By default, interfaces handle tagged traffic for all VLANs. Command settings persist in running-config without taking effect when the switch is not in TAP aggregation mode or the interface is not in TAP aggregation mode.

The no switchport tool allowed vlan and default switchport tool allowed vlan commands restore the tool mode default allowed VLAN setting of all by removing the corresponding switchport tool allowed vlan statement from running-config.

Command Mode
Interface-Ethernet Configuration
Interface-Port Channel Configuration

Command Syntax
switchport tool allowed vlan EDIT_ACTION

Parameters
- EDIT_ACTION modifications to the VLAN list. Options include:
  - v_range creates VLAN list from v_range.
  - add v_range adds specified VLANs to current list.
  - all VLAN list contains all VLANs.
  - except v_range VLAN list contains all VLANs except those specified.
  - none VLAN list is empty (no VLANs).
  - remove v_range removes specified VLANs from current list.

Valid v_range formats include number, range, or comma-delimited list of numbers and ranges.

Example
These commands create the tool mode allowed VLAN list of 16-20 for Ethernet interface 38.

```
switch(config)#interface ethernet 38
switch(config-if-Et38)#switchport tool allowed vlan 16-20
switch(config-if-Et38)#show interfaces ethernet 38 tool
Port      Configured  Status         Allowed              Id
Timestamp  Mode         Vlans  Tag  Mode
-----------------------------------------------------------------------
Et38       access       notconnect  16-20  Off  None
switch(config-if-Et38)#
```
19.1.9.32 switchport tool group

The switchport tool group command modifies the configuration-mode interface’s tool port membership in the specified TAP aggregation groups. Tool ports may belong to multiple TAP aggregation groups. Command options for configuring a port’s TAP aggregation group membership include:

• specifying the groups to which the port belongs (supersedes the port’s previous group memberships).
• adding to the list of groups to which the port belongs.
• deleting from the list of groups to which the port belongs.

TAP aggregation groups associate a set of TAP ports with a set of tool ports. A TAP port can belong to a maximum of one default TAP aggregation group.

The no switchport tool default group and default switchport tool default group commands remove the configuration-mode interface from all TAP aggregation groups to which it is assigned as a tool port by modifying the corresponding statements in running-config.

Command Mode
Interface-Ethernet Configuration
Interface-Port Channel Configuration

Command Syntax
switchport tool group EDIT_ACTION

Parameters
• EDIT_ACTION specifies changes to the list of groups to which the port belongs
  • add group_list specifies additional groups to which the port belongs.
  • remove group_list removes interface as a tool port member from specified groups.
  • set group_list specifies groups to which interface belongs as a tool port.

Valid group_list format is a space-delimited list of one or more TAP aggregation group names.

Restriction
This command is available only on FM6000 platform switches.

Examples
• These commands associate interface Ethernet 40 with three TAP aggregation groups.

  switch(config)#interface ethernet 40
  switch(config-if-Et40)#switchport tool group set tag-1 tag-2 tag-3
  interface Ethernet40
    switchport tool group set tag-3 tag-2 tag-1
  switch(config-if-Et40)#

• These commands add tag-7 to the tap aggregation groups to which Ethernet interface 40 belongs.

  switch(config-if-Et40)#switchport tool group add tag-7
  interface Ethernet40
    switchport tool group set tag-3 tag-7 tag-2 tag-1
  switch(config-if-Et40)#

• These commands specify “tag-9” as the only group to which Ethernet interface 40 belongs.

  switch(config-if-Et40)#switchport tool group set tag-9
  switch(config-if-Et40)#show active
interface Ethernet40
    switchport tool group set tag-9
switch(config-if-Et40)#
19.1.9.33 switchport tool identity

The `switchport tool identity` command configures the configuration-mode interface to add a tier-1 VLAN tag (dot1q) to packets it receives from TAP ports. The VLAN number on the dot1q tag is specified by the `switchport tap identity` command configured for the TAP port that supplies the packets. By default, tool ports do not encapsulate packets with the tier-1 VLAN tag.

The `no switchport tool identity` and `default switchport tool identity` commands restore the default VLAN handling method for the configuration-mode interface by removing the corresponding `switchport tool identity` statement from `running-config`.

**Command Mode**

Interface-Ethernet Configuration  
Interface-Port Channel Configuration

**Command Syntax**

```
switchport tool identity dot1q
no switchport tool identity dot1q
default switchport tool identity dot1q
```

**Restriction**

This command is available only on FM6000 platform switches.

**Example**

These commands configure Ethernet interface 40 to include a dot1q tag on egress packets.

```
switch(config)#interface ethernet 40
switch(config-if-Et40)#switchport tool identity dot1q
switch(config-if-Et40)#show active
interface Ethernet40
   switchport mode tool
   switchport tool identity dot1q
   switchport tool group set tag-9
switch(config-if-Et40)#
```
19.1.9.34  switchport tool truncation

The `switchport tool truncation` command configures the configuration-mode interface, as a tool port, to truncate outbound packets to 160 bytes. This command is in effect when the port is in tool mode and the switch is in TAP aggregation mode. Command settings persist in `running-config` without taking effect when the switch is not in TAP aggregation mode or the interface is not in tool mode. By default, tool ports do not truncate outbound packets.

The `no switchport tool truncation` and `default switchport tool truncation` commands restore the default behavior (not truncating packets that exit the configuration mode interface) by removing the corresponding `switchport tool truncation` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration

Interface-Port Channel Configuration

**Command Syntax**

`switchport tool truncation packet_size`

`no switchport tool truncation`

`default switchport tool truncation`

**Parameters**

- `packet_size` size of truncated packets in bytes. The only permitted value is 160.

**Examples**

- These commands configure Ethernet interface 38, as a tool port, to truncate packets on egress to 160 bytes.

  ```
  switch(config)#interface ethernet 38
  switch(config-if-Et38)#switchport mode tool
  switch(config-if-Et38)#switchport tool truncation 160
  switch(config-if-Et38)#
  ```

- These commands configure Ethernet interface 38 to send complete packets.

  ```
  switch(config)#interface ethernet 38
  switch(config-if-Et38)#no switchport tool truncation
  switch(config-if-Et38)#
  ```
**19.1.9.35 tap aggregation**

The `tap aggregation` command places the switch in TAP-aggregation configuration mode. The switch’s TAP aggregation mode is enabled or disabled by the `mode` command in TAP-aggregation configuration mode.

When TAP aggregation mode is enabled, normal switching and routing operations are disabled. A port’s switchport status depends on the switch’s TAP aggregation mode and the port’s switchport mode:

- **TAP aggregation mode enabled**: TAP and tool ports are enabled. Switching ports are errdisabled.
- **TAP aggregation mode disabled**: TAP and tool ports are errdisabled. Switching ports are enabled.

The `no tap aggregation` and `default tap aggregation` commands disable tap aggregation mode on the switch by removing all TAP-aggregation configuration mode commands from `running-config`.

TAP-aggregation configuration mode is not a group-change mode; `running-config` is changed immediately upon entering commands. Exiting TAP-aggregation configuration mode does not affect `running-config`. The `exit` command returns the switch to global configuration mode.

**Command Mode**
Global Configuration

**Command Syntax**

```
tap aggregation
no tap aggregation
default tap aggregation
```

**Commands Available in TAP-aggregation Configuration Mode**

- `mode (tap-agg configuration mode)`

**Related Commands**

- `switchport mode`

**Example**

- These commands place the switch in TAP-aggregation configuration mode and enable TAP aggregation.

  ```
  switch(config)# tap aggregation
  switch(config-tap-agg)# mode exclusive
  switch(config-tap-agg)# show active
tap aggregation
  mode exclusive
  switch(config-tap-agg)#
  ```

- This command disables TAP aggregation and removes all TAP-aggregation configuration mode commands from `running-config`.

  ```
  switch(config)# no tap aggregation
  switch(config)#
  ```

**19.2 Latency Analyzer (LANZ)**

Arista Networks’ Latency Analyzer (LANZ) is a family of EOS features that provide enhanced visibility into network dynamics, particularly in areas related to the delay packets experience through the
network. The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho, Tomahawk and XP80 switch platforms.

This section describes the purpose, behavior, and configuration of LANZ features. Topics covered by this section include:

- Introduction to LANZ
- LANZ Overview
- Configuring LANZ
- LANZ Commands

19.2.1 Introduction to LANZ

LANZ tracks interface congestion and queuing latency with real-time reporting. With LANZ application layer event export, external applications can predict impending congestion and latency. This enables the application layer to make traffic routing decisions with visibility into the network layer.

With LANZ, network operations teams and administrators have near real-time visibility into the network, enabling early detection of microbursts. LANZ continually monitors congestion, allowing for rapid detection of congestion and sending of application layer messages.

19.2.2 LANZ Overview

LANZ monitors output queue lengths to provide congestion information for individual interfaces. This allows for more detailed analysis of congestion events, and allows identification of potential latency problems before they arise. On some platforms, LANZ also monitors global buffer usage.

Output queues for each port are monitored, and information about queue congestion events can be accessed in the form of system log messages, reports, or streaming.

19.2.2.1 LANZ Monitoring Mechanism

LANZ provides congestion data by continuously monitoring each port’s output queue lengths. When the length of an output queue exceeds the upper threshold for that port, LANZ generates an over-threshold event.

19.2.2.1.1 Notifying and Polling Modes

Notifying Mode

In Notifying Mode (available on all platforms), LANZ monitors congestions on all queues and generates Start, Update, and End events every five seconds or at user-configured intervals.

- **Start** event is generated when any queue on an interface exceeds the upper threshold.
- **Update** events are generated periodically while the congested queue remains above the lower threshold. The interval at which Update events are generated is configured using the `queue-monitor length update-interval` command.
- **End** event is generated when the congested queue drops below the lower threshold.

Polling Mode

Polling Mode is available only on Arad and Jericho switches. On these switches, LANZ can be configured to use Notifying Mode, but it operates in Polling Mode by default. In Polling Mode, LANZ polls the most congested queue in each ASIC and continues to report an over-threshold state every 800 microseconds until all queue lengths for the port pass below the lower threshold.
19.2.2 LANZ Logging

Over-threshold events generated by LANZ can be logged as system log messages. Log messages are generated for events on all ports, at a maximum rate of one message per second per interface. The interval between messages can be configured globally.

Log messages indicate the time of the event, the interface affected, the threshold set for that interface, and the actual number of entries in the port’s queue.

19.2.2.3 LANZ Reporting

Detailed LANZ data can be viewed through the CLI or exported as a CSV-formatted report.

A circular FIFO event buffer is dynamically shared by all interfaces. When an interface begins generating LANZ over-threshold events it can fill all available buffer space. However, each interface is guaranteed sufficient resources for a minimum of 500 entries.

19.2.2.4 LANZ Streaming

On some platforms, external client applications can also receive congestion event information as a data stream. The switch can stream LANZ data to up to 100 clients via TCP through port 50001.

Streamed data is in Google protocol buffer format, and includes both over-threshold events and LANZ configuration information.

19.2.2.5 Platforms

The LANZ feature is available on the FM6000, Arad, Trident II, Trident 3, Jericho and Tomahawk switch platforms. To determine the switch platform from the CLI, enter `show platform ?` at the prompt.

Settings and capabilities differ slightly between the platforms:

- Arad chips measure threshold values in bytes; all others measure threshold values in segments:
  - FM6000 480-byte segments
  - Trident II and Tomahawk 208-byte segments
  - Trident 3 256-byte segments
- FM6000, Trident II, Trident 3, and Tomahawk chips allow configuration of both upper and lower threshold values.
- FM6000, Arad, Jericho, Trident II, Trident 3, and Tomahawk chips support LANZ data streaming.
- Only FM6000 chips support global buffer monitoring.
- While the FM6000, Trident II, Trident 3, Jericho and Tomahawk chips can monitor congestion events for all queues, the Arad chips only monitor the most congested queues.
- Polling Mode is available on Arad and Jericho platforms.
- LANZ is available on CPU ports on Arad, Jericho, Trident II and Tomahawk platforms.
- LANZ is available on fabric ports on Trident, Trident II, Trident 3, and Tomahawk platforms.

19.2.3 Configuring LANZ

LANZ is disabled by default and must be enabled to function. Upper and lower queue-length thresholds can be defined for individual interfaces.

These sections describe the basic LANZ configuration steps:

- Enabling and Disabling LANZ
- Specifying the LANZ Mode on Jericho and Arad Switches
- Configuring LANZ Congestion Thresholds
- Setting LANZ Traffic Sampling
- Logging LANZ Congestion Events
Visibility and Monitoring Services

19.2.3.1  Enabling and Disabling LANZ

LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), allowing the switch to collect and display latency information. LANZ is disabled by default on all other switches. If LANZ is disabled, the `queue-monitor length (global configuration mode)` command enables LANZ with the current settings, or with the default settings if none have been configured.

When LANZ is enabled, the switch monitors queue lengths on all front-panel ports, and on CPU and fabric ports on selected platforms. Queue length data is available in the following forms:

- syslog data (see `queue-monitor length log`)
- CLI display or CSV-format output (see `show queue-monitor length`)
- data stream (see `queue-monitor streaming`)

To disable LANZ globally, enter the `no queue-monitor length` command in global configuration mode. Disabling LANZ globally also discards LANZ log data, but retains settings. To disable LANZ on an individual interface, enter the `no queue-monitor length` command in interface Ethernet configuration mode.

**Examples**

- This command enables LANZ on the switch.

  ```
  switch(config)#queue-monitor length
  switch(config)#
  ```

- This command disables LANZ on the switch.

  ```
  switch(config)#no queue-monitor length
  switch(config)#
  ```

- These commands disable LANZ on Ethernet interface 7.

  ```
  switch(config)#interface ethernet 7
  switch(config-if-Et7)#no queue-monitor length
  switch(config-if-Et7)#
  ```

19.2.3.2  Specifying the LANZ Mode on Jericho and Arad Switches

On Jericho and Arad switches, LANZ operates by default in Polling Mode, which provides congestion data for the most congested queue per ASIC. They also support Notifying Mode (the LANZ mode used on all other switches), which generates Start, Update, and End events for all queues.

Notifying Mode is enabled using the `queue-monitor length notifying` command.

**Examples**

- This command enables Notifying Mode on a Jericho or Arad switch.

  ```
  switch(config)#queue-monitor length notifying
  ```

- This command disables Notifying Mode on a Jericho or Arad switch, returning LANZ to the default Polling Mode.

  ```
  switch(config)#no queue-monitor length notifying
  ```
19.2.3.3 Configuring LANZ Congestion Thresholds
When LANZ is enabled on the switch, it generates over-threshold events when queue lengths on any monitored interface exceed the upper threshold value and continues generating them until all the queue lengths on that interface drop back below the lower threshold.

19.2.3.3.1 Setting the Congestion Update Interval
The queue-monitor length update-interval command specifies the frequency with which congestion information is updated in microseconds.

- This command sets the time between congestion updates to 10 seconds.

```
switch(config)# queue-monitor length update-interval 1000000
switch(config)#
```

- This command resets the time between congestion updates to its default value of 5 seconds.

```
switch(config)# default queue-monitor length update-interval
switch(config)#
```

19.2.3.3.2 Congestion Thresholds on FM6000, Trident II, Trident 3, and Tomahawk Switches
Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, and in 256-byte segments on Trident 3 switches. The default threshold values are 512 segments and 256 segments. To change the threshold values for a specific interface, use the `queue-monitor length thresholds` command.

FM6000 switches can also monitor global buffer usage. Global buffers are measured in 160-byte segments; the default threshold values are 10940 segments and 4376 segments. To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To change the threshold values for global buffer usage monitoring on the switch, use the `queue-monitor length global-buffer thresholds` command.

Examples
- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# queue-monitor length thresholds 300 200
switch(config-if-Et5)#
```

- These commands enable global buffer monitoring on the switch and set the upper and lower thresholds to 9000 segments and 4000 segments.

```
switch(config)# queue-monitor length global-buffer
switch(config)# queue-monitor length global-buffer thresholds 9000 4000
switch(config)#
```

19.2.3.3.3 Congestion Thresholds on Arad Switches
Queue lengths are measured in bytes. The top threshold value can be between 2 and 52428800 bytes (the default value is 52428800 bytes). To change the upper threshold value for a specific interface, use the `queue-monitor length threshold (Arad/Jericho)` command.
Example

These commands set the upper queue-length threshold on Ethernet interface 5 to 2614400 bytes.

```
switch(config)# interface ethernet 5
switch(config-if-Et5)# queue-monitor length thresholds 2614400
switch(config-if-Et5)#
```

19.2.3.3.4 CPU Port Congestion Thresholds

CPU port queue lengths are also monitored on selected platforms. All CPU ports share common threshold values, which are configured using the `queue-monitor length cpu thresholds` command. Individual CPU port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.

  ```
  switch(config)# queue-monitor length cpu thresholds 1000 300
  switch(config)#
  ```

- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.

  ```
  switch(config)# default queue-monitor length cpu thresholds
  switch(config)#
  ```

19.2.3.3.5 Fabric Port Congestion Thresholds

Fabric port queue lengths are also monitored on selected platforms. All fabric ports share common threshold values, which are configured using the `queue-monitor length fabric thresholds` command. Individual fabric port congestion thresholds cannot be separately configured.

Examples

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.

  ```
  switch(config)# queue-monitor length fabric thresholds 1000 300
  switch(config)#
  ```

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.

  ```
  switch(config)# default queue-monitor length fabric thresholds
  switch(config)#
  ```

19.2.3.4 Setting LANZ Traffic Sampling

The switch can be configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination when a queue threshold is crossed by enabling LANZ mirroring through the command `queue-monitor length mirror`. The CPU or an egress interface mirror destination is then configured through the command `queue-monitor length mirror destination`. LANZ traffic sampling includes exporting congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection through the command `tcpdump queue-monitor`. 
Examples

• This command enables LANZ traffic sampling.

```
switch(config)#queue-monitor length mirror
switch(config)#
```

• This command disables LANZ traffic sampling.

```
switch(config)#no queue-monitor length mirror
switch(config)#
```

• This command configures LANZ traffic sampling for a CPU interface mirror destination.

```
switch(config)#queue-monitor length mirror destination cpu
switch(config)#
```

• This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 1 through 5.

```
switch(config)#queue-monitor length mirror destination Ethernet 1-5
switch(config)#
```

• This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 6, 10, and 12 through 14.

```
switch(config)#queue-monitor length mirror destination Ethernet 6,10,12-14
switch(config)#
```

• This command inspects traffic on the switch.

```
switch(config)#tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

19.2.3.5 Logging LANZ Congestion Events

To generate syslog messages when queue lengths on an interface exceed its upper threshold, enable logging with the `queue-monitor length log` command. When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see `queue-monitor length threshold` (Arad/Jericho) or `queue-monitor length thresholds`). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Queue length information is not included in log messages, but can be accessed by displaying LANZ data or exporting reports.

On FM6000 platforms, log messages can also be created whenever global buffer usage exceeds its upper threshold value (see `queue-monitor length global-buffer thresholds`). To enable global buffer monitoring, use the `queue-monitor length global-buffer` command. To log over-threshold events for the global buffer, use the `queue-monitor length global-buffer log` command.
Examples:

- This command enables queue-length over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.

  switch(config)#queue-monitor length log 10

- This command disables queue-length over-threshold logging on the switch.

  switch(config)#queue-monitor length log 0

- This is an example of a queue-length log message.

  Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.

- This command enables global buffer over-threshold logging on the switch with a minimum interval of 60 seconds between messages.

  switch(config)#queue-monitor length global-buffer log 60

19.2.3.6 Viewing LANZ Data

LANZ status, and the data stored in the LANZ data buffer, can be viewed using the CLI. Output varies by switch platform, and can be limited to a specified number of records.

19.2.3.6.1 Viewing LANZ Data on Arad Platform Switches

When LANZ is enabled on an Arad platform switch, the `show queue-monitor length` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the `show queue-monitor length limit` command.

Example

This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch#show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                        Interface   Queue length (segments, 1 to 512 bytes)
-------------------------------------------------------------------------------
0:00:07.43393 ago           Et6         1049
0:00:39.22856 ago           Et7         2039
1 day, 4:33:23.12345 ago    Et6         1077
```

To view the current LANZ configuration for the switch and for each interface, use the `show queue-monitor length status` command.

Example

This command displays LANZ configuration and status information.

```
switch(config)#show queue-monitor length status
Per-Interface Queue Length Monitoring
-------------------------------------------------------------------
Queue length monitoring is enabled
```
19.2.3.6.2 Viewing LANZ Data on FM6000, Trident II, Trident 3, and Tomahawk Platform Switches

When LANZ is enabled on an FM6000, Trident II, Trident 3, or Tomahawk platform switch, the show queue-monitor length command displays a report of recent over-threshold events for a range of interfaces or for all interfaces. By default, the command displays data for all interfaces, limited to the last 1000 records, with the most recent events listed first. To view a subset of the LANZ data, limited to a specified number of records, use the show queue-monitor length limit command.

Example

This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch# show queue-monitor length ethernet 6-8 limit 100
Report generated at 2010-01-01 12:56:13

Time                        Interface   Queue length (segments, 1 to 512 bytes)
-------------------------------------------------------------------------------
0:00:07.43393 ago           Et6         1049
0:00:39.22856 ago           Et7         2039
1 day, 4:33:23.12345 ago    Et6         1077
```

To view the current LANZ configuration for the switch and for each interface, use the show queue-monitor length status command.

Example

This command displays LANZ configuration and status information.

```
switch(config)# show queue-monitor length status
queue-monitor length enabled
Global Buffer Monitoring
------------------------
Global buffer monitoring is enabled
Segment size in bytes :   160
Total buffers in segments : 36864
High threshold : 10940
Low threshold : 4376

Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Segment size in bytes :   480
Maximum queue length in segments : 3647
Port thresholds in segments:
Port     High threshold  Low threshold
Et1                 512            256
Et2                 512            256
Et3                 512            256
Et4                 512            256
Et5                 512            256
```
Segment size for E, U and S congestion records is 480 bytes
Segment size for GL, GU and GH congestion records is 160 bytes

* Max queue length during period of congestion
+ Period of congestion exceeded counter

On the FM6000, Trident II, Trident 3, and Tomahawk platforms, information is also available for the number of dropped packets (see show queue-monitor length drops) and transmission latency (see show queue-monitor length tx-latency); global buffer usage can also be viewed on FM6000 platforms (see show queue-monitor length global-buffer).

19.2.3.7 Streaming LANZ Data

To support analysis of latency conditions, the switch can be configured to stream LANZ congestion and configuration data. The switch streams LANZ data via TCP in Google protocol buffer format through port 50001 and through the management interface.

You must create a client application to receive the streaming data. By default, the switch will accept up to 10 client connections for streaming LANZ data. This limit can be configured up to a maximum of 100. Maximum connections can be configured when LANZ is disabled.

19.2.3.7.1 Enabling and Disabling LANZ Data Streaming

LANZ data streaming is disabled by default. To enable streaming, issue the no show queue-monitor streaming clients command in queue-monitor streaming configuration mode. To disable streaming, use the show queue-monitor streaming clients command.

When streaming is disabled, a message is sent to any connected clients and the connections are closed.

To ensure client access to LANZ data, add a rule to any relevant ACL permitting traffic destined for the LANZ port (50001) before initiating a client connection for streaming from a remote host. A static rule (sequence number 130) in the default control plane ACL permits LANZ traffic, but a similar rule must be added to any user-created ACL.

Examples

- These commands enable the streaming of LANZ data from the switch.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#
```
• These commands disable LANZ data streaming.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#shutdown
switch(config-qm-streaming)#
```

19.2.3.7.2 Configuring Maximum Connections

By default, the switch will accept a maximum of 10 client connections for LANZ data streaming. This maximum can be configured using the `max-connections` command. If a client connects to the switch after the limit has been reached, an error message is sent and the connection is closed.

**Example**

This command sets the maximum number of client connections for LANZ data streaming to 50.

```
switch(config-qm-streaming)#max-connections 50
```

19.2.3.7.3 LANZ Streaming Messages

When streaming is enabled, LANZ sends a message whenever a congestion event or a configuration event occurs. The messages are streamed in Google protocol buffer format.

**Configuration Messages**

A configuration message is sent whenever a change is made to the LANZ configuration settings on the switch. The switch also sends a configuration message when a new client connection is established.

The configuration message includes the following information:

- `timestamp` time of change in configuration in tens of microseconds (UTC).
- `lanzVersion` LANZ feature version.
- `numOfPorts` number of ports in the switch.
- `segmentSize` segment size.
- `maxQueueSize` maximum queue size in segments.
- `qLenInterval` frequency of updates.
- `intfName` name of the port.
- `switchId` ID of the chip on a multi-chip system.
- `portId` ID of the port.
- `internalPort` “true” if it is an internal port.
- `highThreshold` higher threshold value.
- `lowThreshold` lower threshold value.

**Congestion Messages**

A congestion message is sent whenever LANZ generates an over-threshold event.

The congestion message includes the following information:

- `timestamp` time of congestion in micro-seconds (UTC).
- `intfName` name of the port.
- `switchId` ID of the chip on a multi-chip system.
- `portId` ID of the port.
- `queueSize` queue size in segments at time of congestion.
19.2.3.7.4 Creating the LANZ Client

For a client device to receive streaming data from the LANZ server, it must be running a client application designed to receive LANZ data. Client programs must be based on the Google protocol buffer schema file describing the structure of the congestion and configuration messages which LANZ streams.

Google Protocol Buffers

Google protocol buffers provide an efficient mechanism for serializing LANZ data for streaming. A protocol buffer package is needed in order to run a LANZ client.

The latest version of the Google protocol buffer source code is available at this address: http://code.google.com/p/protobuf/downloads/list

LANZ Message Schema

LANZ client applications must be designed based on the LANZ protocol buffer schema, which defines the format and contents of the streamed messages. The schema file is shown below, and is also available in the Extensions/LANZ directory on this page: https://www.arista.com/en/support/software-download

```protobuf
package LanzProtobuf;

message ConfigRecord {
    required uint64 timestamp = 1; // Time of change in configuration in micro-seconds (UTC)
    required uint32 lanzVersion = 2; // LANZ feature version
    required uint32 numOfPorts = 3; // Num of ports in the switch
    required uint32 segmentSize = 4; // Segment size
    required uint32 maxQueueSize = 5; // Maximum queue size in segments
    optional uint32 qLenInterval = 10; // Frequency of update
    message PortConfigRecord {
        required string intfName = 1; // Name of the port
        required uint32 switchId = 2; // Id of the chip on a multi-chip system
        required uint32 portId = 3; // Id of the port
        required bool internalPort = 4; // 'True' if it's an internal port
        required uint32 highThreshold = 5; // Higher threshold
        required uint32 lowThreshold = 6; // Lower threshold
    }
    repeated PortConfigRecord portConfigRecord = 6; // Lanz config details of each port
}

message CongestionRecord {
    required uint64 timestamp = 1; // Time of congestion in micro-seconds (UTC)
    required string intfName = 2; // Name of the port
    required uint32 switchId = 3; // Id of the chip on a multi-chip system
    required uint32 portId = 4; // Id of the port
    required uint32 queueSize = 5; // Queue size in segments at time of congestion
}

message ErrorRecord {
    required uint64 timestamp = 1; // Time of event in micro-seconds (UTC)
    required string errorMessage = 2; // Text message
}

message LanzRecord {
    optional ConfigRecord configRecord = 1;
    optional CongestionRecord congestionRecord = 2;
}
```
Implementation Procedure
The following steps create and install a functional client to receive streamed LANZ data. This procedure assumes a functional Python programming environment.

1. Download the example client (lanz_client.py) from the Arista website. It is available in the Extensions/LANZ directory on this page: https://www.arista.com/en/support/software-download
2. Decompress the GPB archive to a directory.
3. Run the GPB C++ compilation and install. With default flags using GCC on *nix platforms, this will produce a binary called “protoc” in your /usr/local/bin directory.
4. From the archive root, cd to python, and run the following commands:
   python setup.py build
   python setup.py test
5. Next, use the protoc compiler to convert the Lanz.proto file into a Python program called Lanz_pb2.py, used by the client. The command to do so is:
   protoc --python_out=. Lanz.proto
   The --python_out=. flag drops the compiled Python program in the directory where you ran the command.
6. Run lanz_client.py -h to activate the LANZ client.
19.2.4 LANZ Commands

LANZ Commands: Global Configuration
- clear queue-monitor length statistics
- queue-monitor length (global configuration mode)
- queue-monitor length cpu thresholds
- queue-monitor length fabric thresholds
- queue-monitor length global-buffer
- queue-monitor length global-buffer log
- queue-monitor length global-buffer thresholds
- queue-monitor length log
- queue-monitor length mirror
- queue-monitor length mirror destination
- queue-monitor length notifying
- queue-monitor length update-interval
- queue-monitor streaming
- tcpdump queue-monitor

LANZ Commands: Interface Ethernet Configuration Mode
- queue-monitor length threshold (Arad/Jericho)
- queue-monitor length thresholds

LANZ Commands: Queue-Monitor Streaming Configuration Mode
- max-connections

LANZ Display Commands
- show queue-monitor length
- show queue-monitor length all
- show queue-monitor length cpu
- show queue-monitor length csv
- show queue-monitor length drops
- show queue-monitor length ethernet
- show queue-monitor length global-buffer
- show queue-monitor length limit
- show queue-monitor length drops
- show queue-monitor length statistics
- show queue-monitor length status
- show queue-monitor length tx-latency
- show queue-monitor streaming clients
19.2.4.1 clear queue-monitor length statistics

The `clear queue-monitor length statistics` command resets the occurrences of all over-threshold events on the switch including global buffer information (if supported).

**Command Mode**
Privileged EXEC

**Command Syntax**
`clear queue-monitor length statistics`

**Example**
This command resets all over-threshold events and global buffer information on an FM6000 switch.

```
switch#clear queue-monitor length statistics
switch#
```
19.2.4.2  max-connections

The max-connections command sets the maximum number of client connections the switch accepts for streaming LANZ data. The default maximum is 10 connections. To stream LANZ data, you must use the queue-monitor streaming command to enable LANZ data streaming.

Command Mode
Queue-Monitor-Streaming Configuration

Command Syntax
max-connections connections

Parameters
connections  maximum number of simultaneous LANZ streaming client connections the switch will accept. Values range from 1 through 100.

Related Commands
queue-monitor streaming places the switch in queue-monitor-streaming configuration mode.

Example
This command sets the maximum number of client connections the switch accepts for LANZ data streaming to 50.

switch(config-qm-streaming)#max-connections 50
switch(config-qm-streaming)#
19.2.4.3 queue-monitor length (global configuration mode)

The **queue-monitor length** (global configuration mode) command enables LANZ with the current settings, or with the default settings if LANZ has not yet been configured. LANZ is enabled by default on Sand platform switches (those with Arad, Jericho, or Qumran chipsets), and disabled by default on all other switches.

When LANZ is enabled, the switch monitors queue lengths on all ports and generates over-threshold events when an output queue becomes congested. Over-threshold event data is available in the following forms:

- syslog data (see **queue-monitor length log**)
- CLI display or CSV-format output (see **show queue-monitor length**)
- data stream (see **queue-monitor streaming**)

The **no queue-monitor length** command entered in global configuration mode disables LANZ and discards LANZ log data, but retains settings. LANZ settings include:

- logging settings (see **queue-monitor length log**)
- queue length thresholds (see **queue-monitor length threshold (Arad/Jericho/Qumran)** or **queue-monitor length thresholds**).
- data streaming settings (see **queue-monitor streaming**).

To disable LANZ on an interface, use the **no queue-monitor length** command in interface configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length

no queue-monitor length

default queue-monitor length
```

**Examples**

- This command enables LANZ on the switch.
  
  ```
  switch(config)#queue-monitor length
  switch(config)#
  ```

- This command disables LANZ on the switch and discards LANZ data but maintains configurations.
  
  ```
  switch(config)#no queue-monitor length
  switch(config)#
  ```

- This command disables LANZ on Ethernet interface 3/30.
  
  ```
  switch(config)#interface ethernet 3/30
  switch(config-if-Et3/30)#no queue-monitor length
  switch(config-if-Et3/30)#
  ```
19.2.4.4  queue-monitor length cpu thresholds

The `queue-monitor length cpu thresholds` command sets the queue length threshold to define "congested" on all CPU ports for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on a CPU interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.) Different monitoring thresholds cannot be set for individual CPU ports.

The `no queue-monitor length cpu thresholds` and `default queue-monitor length cpu thresholds` commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

**Command Mode**

Global Configuration

**Command Syntax**

```
queue-monitor length cpu thresholds upper_limit lower_limit

no queue-monitor length cpu thresholds

default queue-monitor length cpu thresholds
```

**Parameters**

- `upper_limit` is the queue length in segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512. Segment size varies by platform.
- `lower_limit` When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than `upper_limit`. Values range from 1 to 16382. Default setting is 256.

**Examples**

- This command sets the upper queue-length threshold for congestion monitoring on all CPU ports to 1000 segments and the lower limit to 300 segments.

```
switch(config)# queue-monitor length cpu thresholds 1000 300
```

- This command resets the queue-length thresholds for CPU port congestion to the default values of 512 and 256.

```
switch(config)# default queue-monitor length cpu thresholds
```

19.2.4.5 queue-monitor length fabric thresholds

The `queue-monitor length fabric thresholds` command sets the `queue length threshold` to define “congested” on all fabric ports for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on a fabric interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.) Different monitoring thresholds cannot be set for individual fabric ports.

The `no queue-monitor length fabric thresholds` and `default queue-monitor length fabric thresholds` commands reset thresholds to the default values (high: 512 segments; low: 256 segments).

**Command Mode**
Global Configuration

**Command Syntax**

```
queue-monitor length fabric thresholds upper_limit lower_limit
no queue-monitor length fabric thresholds
default queue-monitor length fabric thresholds
```

**Parameters**

- `upper_limit` is the queue length in segments that triggers an over-threshold event. Values range from 8 to 16382. Default setting is 512. Segment size varies by platform.
- `lower_limit` When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than `upper_limit`. Values range from 1 to 16382. Default setting is 256.

**Examples**

- This command sets the upper queue-length threshold for congestion monitoring on all fabric ports to 1000 segments and the lower limit to 300 segments.

  ```
  switch(config)#queue-monitor length fabric thresholds 1000 300
  switch(config)#
  ```

- This command resets the queue-length thresholds for fabric port congestion to the default values of 512 and 256.

  ```
  switch(config)#default queue-monitor length fabric thresholds
  switch(config)#
  ```
19.2.4.6  queue-monitor length global-buffer log

The `queue-monitor length global-buffer log` command enables logging of global buffer over-threshold events. When logging is enabled, a log message is generated each time the contents of the global buffer exceed the upper threshold value set for the switch (see `queue-monitor length global-buffer thresholds`). Once the global buffer is over the threshold, additional messages are generated at a maximum rate of one per interval as long as the buffer value remains above the lower threshold for the switch.

Global buffer logging is disabled by default.

Log messages do not include buffer usage or congestion information. To view this information, use the `show queue-monitor length global-buffer` command.

The `no queue-monitor length global-buffer log` and `default queue-monitor length global-buffer log` commands disable global buffer logging by removing the corresponding `queue-monitor length global-buffer log` command from `running-config`. The `queue-monitor length global-buffer log` command with an interval value of 0 also disables global buffer logging.

**Command Mode**

Global Configuration

**Command Syntax**

`queue-monitor length global-buffer log interval`

`no queue-monitor length global-buffer log`

`default queue-monitor length global-buffer log`

**Parameters**

- `interval`  minimum interval in seconds between logged messages.
  - 0  global buffer logging is disabled on the switch (the default setting).
  - 1 to 65535  minimum logging interval (in seconds).

**Guidelines**

This command is available on FM6000 platform switches.

**Examples**

- This command enables global buffer logging with a minimum interval of 10 seconds between messages.
  
  switch(config)#queue-monitor length global-buffer log 10

- This command disables global buffer logging on the switch.
  
  switch(config)#no queue-monitor length global-buffer log
19.2.4.7 queue-monitor length global-buffer thresholds

The queue-monitor length global-buffer thresholds command sets global buffer thresholds for the switch. An over-threshold event is generated when usage of the global buffer exceeds the upper threshold, and over-threshold events continue to be generated until usage drops below the lower threshold. (To log these events, use the queue-monitor length global-buffer log command.)

The no queue-monitor length global-buffer and default queue-monitor length global-buffer commands disable global buffer reporting.

The no queue-monitor length global-buffer thresholds and default queue-monitor length global-buffer thresholds commands erase custom global buffer threshold settings.

Command Mode
Global Configuration

Command Syntax
queue-monitor length global-buffer thresholds max_segments min_segments
no queue-monitor length global-buffer log
default queue-monitor length global-buffer log

Parameters
• max_segments  upper threshold in 160-byte segments. Value ranges from 2 to 36864. Default is 10940.
• min_segments  lower threshold in 160-byte segments. Value ranges from 1 to 36864. Default is 4376.

Examples
• This command sets the upper and lower global buffer thresholds to 9000 segments and 3000 segments.

```plaintext
switch(config)#queue-monitor length global-buffer thresholds 9000 3000
switch(config)#
```

• This command resets the upper and lower global buffer thresholds to their default values.

```plaintext
switch(config)#no queue-monitor length global-buffer thresholds 9000 3000
switch(config)#
```
19.2.4.8  queue-monitor length global-buffer

The `queue-monitor length global-buffer` command includes global buffer usage in LANZ reporting.

When global buffer reporting is enabled, over-threshold events are generated when global buffer usage exceeds the upper threshold. To set the threshold value, use the `queue-monitor length global-buffer thresholds` command. Usage data may be viewed using the `show queue-monitor length global-buffer` command. To view status and threshold information, use the `show queue-monitor length status` command.

Global buffer usage is measured in segments of 160 bytes.

The `no queue-monitor length global-buffer` and `default queue-monitor length global-buffer` commands disable global buffer usage reporting by removing the corresponding `queue-monitor length global-buffer` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

- `queue-monitor length global-buffer`
- `no queue-monitor length global-buffer`
- `default queue-monitor length global-buffer`

**Guidelines**

This command is available on FM6000 platform switches.

**Examples**

- This command enables global buffer monitoring on the switch.

  ```
  switch(config)#queue-monitor length global-buffer
  switch(config)#
  ```

- This command disables global buffer monitoring on the switch.

  ```
  switch(config)#no queue-monitor length global-buffer
  switch(config)#
  ```
queue-monitor length log

The **queue-monitor length log** command enables logging of queue-length over-threshold events when LANZ is enabled on the switch (see queue-monitor length (global configuration mode)). When logging is enabled, a log message is generated each time one or more queues on an interface exceed the upper threshold value for that interface (see queue-monitor length threshold (Arad/Jericho)). Once an interface is over threshold, additional messages are generated at a maximum rate of one per interval as long as the queue length remains above the lower threshold for that interface. No syslog message is generated when queue length drops back under threshold.

Logging is disabled by default.

Log messages do not include queue length information. To view queue length information, use the **show queue-monitor length** command.

The queue-monitor length log command with an interval value of 0 disables event logging.

**Command Mode**
Global Configuration

**Command Syntax**

```
queue-monitor length log interval
```

**Parameters**
- **interval** minimum interval in seconds between logged messages from a single interface.
  - 0 queue-length logging is disabled on the switch (the default setting).
  - 1 to 65535 minimum logging interval (in seconds).

**Examples**
- This command enables over-threshold logging with a minimum interval of 10 seconds between messages for a given interface.

```
switch(config)#queue-monitor length log 10
```

- This command disables queue-length over-threshold logging on the switch.

```
switch(config)#queue-monitor length log 0
```

- This is an example of a queue-length log message.

```
Oct 27 12:48:22 switch QUEUE_MONITOR-6-LENGTH_OVER_THRESHOLD: Interface Ethernet6 queue length is over threshold of 512, current length is 1024.
```
19.2.4.10 queue-monitor length mirror destination

The `queue-monitor length mirror destination` command results in automatically sending traffic experiencing congestion to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. Before using this command, first enable LANZ mirroring through the command `queue-monitor length mirror`.

**Command Mode**
Global Configuration

**Command Syntax**

```
queue-monitor length mirror destination cpu | Ethernet <ports 1-24>
```

**Parameters**

`ports` any combination of Ethernet ports 1 through 24.

**Examples**

- This command configures LANZ traffic sampling for a CPU interface mirror destination.

  ```
  switch(config)#queue-monitor length mirror destination cpu
  switch(config)#
  ```

- This command configures LANZ traffic sampling for an Ethernet interface mirror destination for ports 3, 11, and 15 through 20.

  ```
  switch(config)#queue-monitor length mirror destination Ethernet 3,11,15-20
  switch(config)#
  ```
19.2.4.11 queue-monitor length mirror

The `queue-monitor length mirror` command enables LANZ mirroring. As a result, the switch is configured to automatically send congested traffic to either the CPU or an Ethernet egress interface destination, once a queue threshold is crossed. To set the destination for the mirrored traffic, use the `queue-monitor length mirror destination` command.

**Command Mode**
Global Configuration

**Command Syntax**

`queue-monitor length mirror`

**Examples**

- This command enables LANZ traffic sampling.
  
  ```
  switch(config)#queue-monitor length mirror
  switch(config)#
  ```

- This command disables LANZ traffic sampling.
  
  ```
  switch(config)#no queue-monitor length mirror
  switch(config)#
  ```
19.2.4.12 queue-monitor length notifying

The `queue-monitor length notifying` command enables Notifying Mode on Arad and Jericho switches. By default, LANZ operates in Polling Mode on Arad and Jericho switches. On all other switches, LANZ operates only in Notifying Mode.

When Notifying Mode is enabled, the switch provides detailed congestion information including Start, Update, and End events, rather than only polling the most congested queue in each ASIC. Notifying Mode uses both upper and lower threshold values. Both can be set with the `queue-monitor length thresholds` command. While a queue is congested, the maximum queue size is updated every five seconds by default; this interval can be configured using the `queue-monitor length update-interval` command.

The `no queue-monitor length notifying` and `default queue-monitor length notifying` commands reset LANZ to the default Polling Mode.

Command Mode
Global Configuration

Command Syntax

`queue-monitor length notifying`
`no queue-monitor length notifying`
`default queue-monitor length notifying`

Guidelines

- Polling mode is available only on Arad and Jericho platform switches.
- On Jericho platforms, LANZ will revert to Polling Mode if there are not enough counter resources to operate in Notifying Mode.
- On Arad platforms, Notifying Mode is incompatible with SSO. Enabling SSO while Notifying Mode is enabled will cause LANZ to revert to Polling Mode.
- On Arad platforms, Notifying Mode is not available for CPU queues. Use Polling Mode when monitoring congestion on CPU queues on Arad switches.
- If the switch is rebooted while Notifying Mode is enabled, queue threshold values may be lost.

Examples

- This command enables Notifying Mode on an Arad or Jericho switch.

```
switch(config)#queue-monitor length notifying
switch(config)#
```

- This command disables Notifying Mode on an Arad or Jericho switch, returning LANZ to the default Polling Mode.

```
switch(config)#no queue-monitor length notifying
switch(config)#
```
The `queue-monitor length threshold` command sets the upper queue-length threshold on Arad, Jericho, and Qumran platforms to define "congested" on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.)

Entering the `no queue-monitor length` command in interface configuration mode disables LANZ on the interface. Entering either the `queue-monitor length threshold` command or the `default queue-monitor length threshold` command enables LANZ on the interface by removing the `no queue-monitor length` command from the configuration.

The `no queue-monitor length threshold` and `default queue-monitor length threshold` commands erase custom queue length threshold settings for the interface.

**Command Mode**
Interface-Ethernet Configuration

**Command Syntax**
```
queue-monitor length threshold upper_limit
no queue-monitor length
default queue-monitor length
```

**Parameters**

`upper_limit` is the queue length in bytes that triggers an over-threshold event. Values range from 40962 to 52428800 bytes. Default setting is 52428800.

**Guidelines**

On Arad, Jericho, and Qumran platforms, the queue length is measured in bytes. Only the upper threshold is configurable using this command, and it is set at a default value of 52428800 bytes. Both upper and lower thresholds can be set using the `queue-monitor length thresholds` command.

**Examples**

- These commands set the upper queue-length threshold on Ethernet interface 3/30 to 40000000 bytes.

  ```
  switch(config)#interface ethernet 3/30
  switch(config-if-Et3/30)#queue-monitor length threshold 40000000
  switch(config-if-Et3/30)#
  ```

- These commands reset the upper queue-length threshold on Ethernet interface 3/30 to its default value of 52428800 bytes.

  ```
  switch(config)#interface ethernet 3/30
  switch(config-if-Et3/30)#default queue-monitor length threshold
  switch(config-if-Et3/30)#
  ```
19.2.4.14 queue-monitor length thresholds

The `queue-monitor length thresholds` command sets both upper and lower queue length thresholds to define “congested” on the command-mode interface for purposes of LANZ reporting. If LANZ is enabled (see `queue-monitor length (global configuration mode)`), an over-threshold event is generated when one or more queues on the interface exceed the upper threshold, and over-threshold events continue to be generated until all queue lengths on the interface drop below the lower threshold. (To log these events, use the `queue-monitor length log` command.)

Entering the `no queue-monitor length` command in interface configuration mode disables LANZ on the interface. Entering either the `queue-monitor length` command or the `default queue-monitor length` command in interface configuration mode enables LANZ on the interface by removing the `no queue-monitor length` command from the configuration.

The `no queue-monitor length thresholds` and `default queue-monitor length thresholds` commands in interface configuration mode both erase custom queue length threshold settings for the interface.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
queue-monitor length thresholds upper_limit lower_limit
no queue-monitor length
default queue-monitor length
```

**Parameters**

- `upper_limit` queue length in segments that triggers an over-threshold event. Must be higher than `lower_limit`. The minimum value is 2. The maximum is the largest number of segments which can be queued before packets are dropped, and varies based on factors including flow control state and private buffer settings. Default setting is 512.

- `lower_limit` lower queue length threshold in segments. When logging is enabled, an over-threshold interface continues generating over-threshold events until all its queues drop back below this length. Must be lower than `upper_limit`. Values range from 1 to 4806. Default setting is 256.

**Guidelines**

Queue lengths are measured in 480-byte segments on FM6000 switches, in 208-byte segments on Trident II and Tomahawk switches, in 256-byte segments on Trident 3 switches, and in bytes on Arad and Jericho switches. Default thresholds vary by platform. Both upper and lower thresholds are configurable.

**Examples**

- These commands set the upper and lower queue-length thresholds on Ethernet interface 5 to 300 segments and 200 segments.

  switch(config)#interface ethernet 5
  switch(config-if-Et5)#queue-monitor length thresholds 300 200
  switch(config-if-Et5)#

- These commands reset the upper and lower queue-length thresholds on Ethernet interface 5 to their default values.

  switch(config)#interface ethernet 5
  switch(config-if-Et5)#default queue-monitor length thresholds
  switch(config-if-Et5)#
19.2.4.15 queue-monitor length update-interval

The `queue-monitor length update-interval` command sets the interval between congestion updates when LANZ is in Notifying Mode.

The `no queue-monitor length update-interval` and `default queue-monitor length update-interval` commands reset the update interval to its default value of 5000000 (5 seconds).

**Command Mode**
Global Configuration

**Command Syntax**

```plaintext
queue-monitor length update-interval interval
no queue-monitor length
default queue-monitor length
```

**Parameters**

`interval` is the time in microseconds between congestion updates. Values range from 80-10000000; default setting is 5000000 (5 seconds).

**Examples**

- This command sets the time between congestion updates to 10 seconds.

  ```plaintext
  switch(config)#queue-monitor length update-interval 10000000
  switch(config)#
  ```

- This command resets the time between congestion updates to its default value of 5 seconds.

  ```plaintext
  switch(config)#default queue-monitor length update-interval
  switch(config)#
  ```
19.2.4.16 queue-monitor streaming

The `queue-monitor streaming` command places the switch in queue-monitor-streaming configuration mode. Queue-monitor-streaming configuration mode is not a group change mode; `running-config` is changed immediately upon command entry. The exit command does not affect `running-config`.

To enable LANZ data streaming on the switch, use the `no show queue-monitor streaming clients` command.

The `exit` command returns the switch to global configuration mode.

**Command Mode**

Global Configuration

**Command Syntax**

queue-monitor streaming

**Commands Available in queue-monitor streaming Configuration Mode**

- max-connections
- show queue-monitor streaming clients

**Example**

This command places the switch in queue-monitor streaming configuration mode.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#
```
show queue-monitor length all

The `show queue-monitor length all` command displays all available over-threshold event records on the switch including global buffer information, with the most recent events listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

Command Mode
EXEC

Command Syntax
```
show queue-monitor length all
```

Guidelines
This command is available on FM6000 platform switches.

Example
This command displays all available LANZ records from the switch.

```
switch> show queue-monitor length all

E-End, U-Update, S-Start, TC-Traffic Class

switch>
```
19.2.4.18 show queue-monitor length cpu

The `show queue-monitor length cpu` command displays LANZ data for CPU ports on the switch. On Trident II and Tomahawk platforms, the “Interface” column identifies the CPU port by its card slot and chip index.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length cpu`

**Examples**

- This command displays LANZ data for CPU ports on a Trident II or Tomahawk switch.

```
show queue-monitor length drops

The `show queue-monitor length drops` command displays a report of cumulative transmission drop totals for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length [INTERFACES][FACTOR] drops`

**Parameters**

- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - `<no parameter>` displays the last 1000 records.
  - `limit number samples` displays the last `number` records.
  - `limit number seconds` displays all records generated during the last `number` seconds.

Value of number ranges from 1 to 1000000.

**Guidelines**

This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

**Example**

- This command displays the last 10 records of transmission drop data on an FM6000 switch.

```
switch>show queue-monitor length limit 10 samples drops

```
19.2.4.21 show queue-monitor length ethernet

The `show queue-monitor length ethernet` command displays a report of recent over-threshold events for a range of interfaces, with the newest events listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length ethernet e-range`

**Parameters**

`e-range` the range of interfaces to be included in the report; formats include a number, number range, or comma-delimited list of numbers and ranges

**Examples**

- This command displays the last 1000 records for Ethernet interface 9 on an FM6000 platform switch.

```
switch>show queue-monitor length ethernet 9

switch>
```
This command displays the last 1000 records for Ethernet interface 24 on an Arad or Jericho platform switch in Polling Mode.

Note: The non-sequential listing of ingress ports shown here is specific to Jericho switches; interfaces on Arad switches are always displayed sequentially.
19.2.4.22 show queue-monitor length global-buffer

The `show queue-monitor length global-buffer` command displays a report of recent high usage, low usage and update events for the global buffer. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length global-buffer`

**Guidelines**

This command is available on FM6000 platform switches.

**Example**

- This command displays the global buffer event records for the switch.

```
switch> show queue-monitor length global buffer
Report generated at 2013-04-01 14:30:07

19.2.4.23 show queue-monitor length limit

The `show queue-monitor length limit` command displays a report of recent over-threshold events for a range of interfaces or for all interfaces, limited by a specified number of records.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length limit [INTERFACES] number`

**Parameters**

- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges
- **number** number of records to display. Values range from 1 to 1000000.
Example

This command displays the last 100 records for Ethernet interfaces 6 through 8.

```
switch>show queue-monitor length ethernet 6-8 limit 100 samples
Report generated at 2010-01-01 12:56:13

switch>
```
19.2.4.24  show queue-monitor length statistics

The `show queue-monitor length statistics` command displays LANZ statistics for all interfaces, showing the traffic class and number of recorded congestion events for each interface.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length statistics`

**Example**

This command displays LANZ statistics for all interfaces on the switch.

```
switch> show queue-monitor length statistics
Report generated at 2016-02-09 22:59:56
Interface   Traffic Class Count
---------------------------------------------------------

<td>1</td>
</tr>
</tbody>
</table>
19.2.4.25 show queue-monitor length status

The `show queue-monitor length status` command displays the current LANZ configuration for the switch and for each interface. On certain platforms, the status of global buffer monitoring and per-linecard LANZ mode are displayed.

Command Mode
EXEC Global Configuration

Command Syntax
```
show queue-monitor length status
```

Guidelines
On FM6000 platform switches, this command includes status information about global buffer monitoring.

On Arad and Jericho based linecards, if LANZ is globally enabled (using the `queue-monitor length` command), the command displays the monitoring mode per-linecard.

On Arad and Jericho switches, even when all linecards are configured in Notifying Mode (using the `queue-monitor length notifying` command), some linecards may still run LANZ in Polling Mode under the following circumstances:

- On Arad-based linecards, LANZ falls back to Polling Mode when SSO redundancy mode is configured on the card (here, the mode is shown as “polling due to SSO configured”).
- On Jericho-based linecards, LANZ may run in Polling Mode when many features that use the switch’s statistic capabilities have been configured (here, the mode is shown as “polling due to counters exhausted”).

Examples

- This command displays the current LANZ configuration on an FM6000 device.

```
switch# show queue-monitor length status
queue-monitor length enabled
queue-monitor length packet sampling is disabled
queue-monitor length update interval in micro seconds:  5000000
Global Buffer Monitoring
-------------------------------
Global buffer monitoring is enabled
Segment size in bytes :  160
Total buffers in segments : 49152
High threshold : 16862
Low threshold :  6745

Per-Interface Queue Length Monitoring
-------------------------------------
Queue length monitoring is enabled
Segment size in bytes :  480
Maximum queue length in segments :  5621
Port thresholds in segments:
         Port | High threshold | Low threshold | Mirroring | Enabled
         Cpu |  512         |     256       |       True|
         Et1 |  512         |     256       |       True|
         Et2 |  512         |     256       |       True|
         Et3 |  512         |     256       |       True|

```
The `show queue-monitor length tx-latency` command displays the latency data of recent LANZ events for a range of interfaces or for all interfaces. Output can be limited to a specified number of seconds or records. The most recent events are listed first. By default, the command displays data for all interfaces, limited to the last 1000 records. Newest events are listed first.

LANZ must be enabled to use this command (see `queue-monitor length (global configuration mode)`). If LANZ is disabled, the command displays “queue-monitor is disabled.”

**Command Mode**
EXEC

**Command Syntax**
```
show queue-monitor length [INTERFACES][FACTOR] tx-latency
```

**Parameters**
- **INTERFACES** interface type and number for report. Values include:
  - `<no parameter>` displays information for all interfaces.
  - `ethernet e-range` e-range formats include a number, number range, or comma-delimited list of numbers and ranges.
- **FACTOR** limiting parameter for report. Values include:
  - `<no parameter>` displays the last 1000 records.
  - `limit number samples` displays the last `number` records.
  - `limit number seconds` displays all records generated during the last `number` seconds.

Value of `number` ranges from 1 to 1000000.

**Guidelines**
This command is available on FM6000, Trident II, Trident 3, and Tomahawk platform switches.

**Example**
This command displays transmission latency data for the last 1000 LANZ events on the switch.

```
switch>show queue-monitor length tx-latency

```
19.2.4.27  show queue-monitor length

The **show queue-monitor length** command displays a report of recent over-threshold events for all interfaces, limited to the last 1000 records, with the newest events listed first.

LANZ must be enabled to use this command (see *queue-monitor length (global configuration mode)*). If LANZ is disabled, the command displays “queue-monitor is disabled.”

To limit the output to a specified number of seconds and/or records, use the **show queue-monitor length limit** command.

**Command Mode**

EXEC

**Command Syntax**

`show queue-monitor length`

**Examples**

- This command displays the last 1000 LANZ records on an Arad or Jericho platform switch in Polling Mode.

```
switch> show queue-monitor length

switch>
19.2.4.28  show queue-monitor streaming clients

The `show queue-monitor streaming clients` command displays the number of presently connected clients through LANZ streaming, and also displays their host-names. Ensure that both LANZ and LANZ streaming are enabled in order to use this command.

Command Mode

EXEC

Command Syntax

`show queue-monitor streaming clients`

Example

This command displays the number of clients connected to LANZ streaming.

```
switch# show queue-monitor streaming clients
Number of clients connected: 3
--------------------------------
172.20.63.161:6565
172.24.17.58:42
172.38.54.142:333
```
19.2.4.29 shutdown (queue-monitor-streaming configuration)

The `shutdown` command disables the streaming of LANZ data to external clients. The `no shutdown` command enables LANZ data streaming. Streaming is disabled by default.

**Command Mode**

Queue-Monitor-Streaming Configuration

**Command Syntax**

`shutdown`

`no shutdown`

**Example**

These commands enable the streaming of LANZ data on the switch.

```
switch(config)#queue-monitor streaming
switch(config-qm-streaming)#no shutdown
switch(config-qm-streaming)#
```
19.2.4.30 tcpdump queue-monitor

The tcpdump queue-monitor command exports congested traffic to a packet capture device or another tool for analysis, or directly to the switch CPU for inspection.

Command Mode
Global Configuration

Command Syntax

tcpdump queue-monitor

tcpdump queue-monitor [file | filecount | filter | lookup-names | max-file-size | packet-count | size | verbose]

Parameters

- **file** output file.
  - certificate: certificate file.
  - flash: flash file.
  - sslkey: sslkey file.
  - usb1: usb1 file.
- **filecount** specify the number of output files: 1 to 100.
- **filter** set the filtering expression to select which packets will be dumped.
- **lookup-names** enable reverse DNS lookups.
- **max-file-size** specify the maximum file size by entering 1 to 100 million bytes.
- **packet-count** specify 1 to 10000 packets to capture.
- **size** specify the maximum number of bytes to dump per packet with a size of 1 to 65536 bytes.
- **verbose** enable verbose mode.

Example

This command inspects traffic on the switch.

```
switch(config)#tcpdump queue-monitor
tcpdump: WARNING: lanz: no IPv4 address assigned
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on lanz, link-type EN10MB (Ethernet), capture size 65535 bytes
...
0 packets captured
0 packets received by filter
0 packets dropped by kernel
switch(config)#
```

19.3 Sampled Flow Tracking

This chapter describes Arista’s implementation of sampled flow tracking, including configuration instructions and command descriptions. Topics covered by this chapter include:

- Sampled Flow Tracking Overview
- Configuring Sampled Flow Tracking
- Hardware Flow Tracking with IPFIX Export
- Sampled Flow Tracking Configuration Examples
- Sampled Flow Tracking Commands
19.3.1 Sampled Flow Tracking Overview

Network administrators require access to flow information that passes through various network elements to analyze and monitor networks. Sampled flow tracking provides access to IP flow information by sampling traffic flows in ingress direction on the interfaces on which it is configured. The samples are then used to create flow records that are exported to the configured collectors in the Internet Protocol Flow Information Export (IPFIX) format.

Sampled flow tracking terminology:

- Flow tracker: It is a collection of interfaces that collect samples and create flow records. The flow tracker has one or more exporters.
- Exporter: It sends flow records to one or more collectors.
- Collector: It receives flow records from one or more exporters.
- Data record: It contains values of the parameters corresponding to a template record.
- Template record: It defines the structure and interpretation of fields in a data record. It is an ordered sequence of type and length pairs.
- Options template record: It is a type of template record that defines the structure and interpretation of fields in a data record, including how to scope the applicability of the data record.

Data records are created based on the following flow key fields: source IP address, destination IP address, IP protocol, source port, destination port, VRF, and VLAN. These records support IPv4 flow data record and IPv6 flow data record.

Sampled flow tracking supports the following options data records:

- VRF record: mapping of VRF ID to VRF name.
- Interface record: mapping of interface ID to interface name.
- Flow key indicator record: mapping of template ID to flow key indicator.
- Flow tracker record: contains information about configured flow tracker.

19.3.1.1 Sampled Flow Tracking Limitations

The limitations of Sampled flow tracking are:

- Sampled flow tracking is active only when sFlow is disabled on the device.
- Sampled flow tracking does not support export of IPFIX messages over ECMP paths.
- Sampled flow tracking route simulation is not supported for ECMP paths.

19.3.2 Configuring Sampled Flow Tracking

These sections describe sampled flow tracking configurations.

Configuring Sampled Flow Tracking

Use the `flow tracker sampled` command to enable sampled flow tracking on a tracker. Each tracker should have a minimum of one exporter configured.

Example

This command enables sampled flow tracking on an interface Eth1 and the flow tracker ftr1.

```bash
switch(config)# interface Eth1
switch(config-if-Et1)# flow tracker sampled ftr1
```

Use the `sample` command to enable the sample rate for a specific sampled flow tracker. The default sample rate is 1048576.

Example
These commands configure a sample rate of 1024 for the sampled flow tracker.

switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#sample 1024

19.3.2.1 Configuring the Sampled Flow Tracker

Use the `tracker` command to configure a sampled flow tracker for a device.

**Example**

This command configures a sampled flow tracker named `ftr1`.

switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1

Use the `record export on interval` command to configure the interval at which active flow records are exported. The default interval is 300000 milliseconds.

**Example**

These commands configure an active record interval of 7000 for the exporter `exp1`.

switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on interval 7000

Use the `record export on inactive timeout` command to configure the interval at which timed-out inactive flow records are exported. The default interval is 15000 milliseconds.

These commands configure an inactive record interval of 4000 for the exporter `exp1`.

switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#record export on inactive timeout 4000

19.3.2.2 Configuring Exporter for Sampled Flow Tracker

Use the `exporter` command to configure or unconfigure an exporter for a specific tracker.

**Example**

This command configures exporter `exp1` for the specific tracker `ftr1`.

switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1

Use the `collector` command to configure the collector for the specific exporter.

**Example**

These commands configure a collector for the IPv4 address 192.0.2.0 and collector port number 10.

switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
Use the **local interface** command to configure the local source interface for the specific exporter.

**Example**

These commands configure the local source interface Ethernet1 for the exporter exp1.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#local interface Ethernet1
```

Use the **dscp** command to configure the DSCP value for the specific exporter. The default DSCP value is 0.

**Example**

These commands configure a DSCP value of 10 for the exporter exp1.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#dscp 10
```

Use the **format ipfix version** command to configure the IPFIX version and maximum packet size for the specific exporter. The default IPFIX version is 10 and the default maximum packet size is 9152.

**Example**

These commands configure an IPFIX version of 10 and a maximum packet size of 854 for the exporter exp1.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#format ipfix version 10 max-packet-size 854
```

Use the **template interval** command to configure the interval at which templates are exported for the specific exporter. The default template interval is 3600000 milliseconds.

**Example**

This command configures the interval of 3400000 milliseconds for the exporter exp1.

```
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
```

## 19.3.3 Hardware Flow Tracking with IPFIX Export

Hardware flow tracking uses match criteria to collect data from packets based on defined flow profiles. The data collected is sent to an external node called Collector using IPFIX flow export protocol. The flow tracking engine tracks up to 32K flows going through a given set of ports in a switch with IPFIX-capability. Flow tracking is configured on physical interfaces or LAG interfaces. The matching fields in the packet header are:

- IP source
- IP destination
- IP protocol
- IP protocol's source port
- IP protocol's destination port

The information collected is:
- Byte count (4 bytes)
- Packet count (4 bytes)
- New-learn timestamp
- Flow start timestamp
- Flow end timestamp

**Platform Compatibility:**

Hardware flow-tracking is currently supported on CCS-720XP.

**Configuring Hardware Flow-tracking**

This file extract show a hardware flow-tracking configuration.

```
! Define a loopback interface to act as the local source interface for IPFIX export
int Loopback0
  ip address 1.2.3.4/32

@ Enable IP routing for IPFIX packet to be routed to the collector
ip routing

! The flow tracker definition
flow tracking hardware
  tracker myFtr
    record export on inactive timeout 60000
    record export on interval 30000
    !
    exporter myExporter
      local interface Loopback0
      template interval 5000
      collector 172.28.130.153
      no shutdown

! Flow tracked interface/port
int Ethernet48
  flow tracker hardware myFtr
  no shutdown
```

This command shows general information about hardware flow tracking.

```
switch# show flow tracking hardware

19.3.4 Sampled Flow Tracking Configuration Examples

This section describes the command configurations required to configure sampled flow tracking.

19.3.4.1 Sampled Flow Tracking Basic Configuration

The following commands enable a basic configuration.

1. Enable configuration mode for the sampled flow tracking on a device.

   switch(config)#flow tracking sampled

2. Configure a sampled flow tracker for a device.

   switch(config-flow-tracking-sampled)# tracker ftr1

3. Configure an exporter for the specific tracker.

   switch(config-ftr-sampled-tr-ftr1)# exporter exp1

4. Configure the collector for the specific exporter.

   switch(config-ftr-sampled-tr-ftr1-exp-exp1)#collector 172.31.22.131

5. Configure the local source interface Ethernet1 for the specific exporter.

   switch(config-ftr-sampled-tr-ftr1-exp-exp1)#local interface Ethernet1

   switch(config-ftr-sampled-tr-ftr1-exp-exp1)#no shutdown

7. Configure the interface Ethernet2 for the specific exporter.

   switch(config)#interface Ethernet2

---

Flow Keys Table, Template ID: 258, Scope: templateId

</tbody>
</table>
8. Configure the sampled flow tracker on the interface Ethernet2.

```
switch(config)#interface Ethernet2
switch(config-if-Et2)# flow tracker sampled ftr1
```
19.3.5 Sampled Flow Tracking Commands

This section contains descriptions of Sampled flow tracking commands.

Configuration Commands
- collector
- dscp
- exporter
- flow tracking sampled
- format ipfix version
- local interface
- record export on inactive timeout
- record export on interval
- sample
- shutdown (sampled flow tracking)
- template interval
- tracker

Interface Configuration Command
- flow tracker sampled

Privileged EXEC Command
- clear flow tracking sampled counters

Sampled Flow Tracking Display Commands
- show flow tracking sampled
- show flow tracking sampled counters
- show flow tracking sampled flow-table
- show flow tracking sampled ipfix options-table
- show flow tracking sampled ipfix template
19.3.5.1 clear flow tracking sampled counters

The clear flow tracking sampled counters command clears the flow tracking counters for all trackers, a specified tracker, or a specified tracker and exporter.

Command Mode
Privileged EXEC

Command Syntax

```
clear flow tracking sampled counters [ tracker tracker_name [ exporter exporter_name ] ]
```

Parameters

- tracker tracker_name Specifies the flow tracker.
- exporter exporter_name Specifies the exporter.

Example

- This command clears the flow counters for the tracker ftr1 and exporter exp1.

  ```
  switch#clear flow tracking sampled counters tracker ftr1 exporter exp1
  switch#
  ```
19.3.5.2 collector

The collector command configures a collector to receive flow records from a specified exporter.

The no collector and default collector commands remove the configured collector from running-config.

Command Mode

Sampled Flow Tracking Exporter Configuration

Command Syntax

```
collector { ipv4_address | ipv6_address }[ port port_number ]

no collector { ipv4_address | ipv6_address }[ port port_number ]

default collector { ipv4_address | ipv6_address }[ port port_number ]
```

Parameters

- `ipv4_address` Specifies the IPv4 address of the collector.
- `ipv6_address` Specifies the IPv6 address of the collector.
- `port port_number` Specifies the port number for the collector. Values range from 1 to 65535. The default value is 4739.

Example

- These commands configure a collector for the IPv4 address 192.0.2.0 and collector port number 10.

```
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter expl
switch(config-ftr-sampled-tr-ftr1-exp-expl)#collector 192.0.2.0 port 10
switch(config-ftr-sampled-tr-ftr1-exp-expl)#exit
switch(config-ftr-sampled-tr-ftr1)#exit
switch(config-flow-tracking-sampled)#exit
switch(config)#
```
19.3.5.3 **dscp**

The `dscp` command configures the Differentiated Services Code Point (DSCP) value for a specific exporter.

The `no dscp` and `default dscp` commands reset the DSCP value to the default of 0.

**Command Mode**

Sampled Flow Tracking Exporter Configuration

**Command Syntax**

```
dscp dscp_value
no dscp dscp_value
default dscp dscp_value
```

**Parameters**

- `dscp_value` the DSCP value assigned to the exporter. Value ranges from 0 to 63. Default value is 0.

**Example**

- These commands configure a DSCP value of 10 for the exporter `exp1`.

```bash
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#dscp 10
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#exit
switch(config-ftr-sampled-tr-ftr1)#exit
switch(config-flow-tracking-sampled)#exit
switch(config)#
```
19.3.5.4 exporter

The exporter command places the switch in sampled flow tracking exporter configuration mode for the specified exporter and creates the exporter if it does not yet exist.

The no exporter and default exporter commands remove the specific exporter from running-config.

Command Mode
Sampled Flow Tracking Tracker Configuration

Command Syntax
exporter exporter_name
no exporter exporter_name
default exporter exporter_name

Parameters
• exporter_name the name of the exporter.

Example
• These commands create exporter exp1 for the flow tracker ftr1 and place the switch in configuration mode for that exporter.

```plaintext
switch(config)#flow tracking sampled
switch(config-flow-tracking-sampled)#tracker ftr1
switch(config-ftr-sampled-tr-ftr1)#exporter expl
switch(config-ftr-sampled-tr-ftr1-exp-exp1)#
```
19.3.5.5  flow tracker sampled

The flow tracker sampled command configures an interface to be part of a flow tracker. An interface can belong to only one flow tracker.

The no flow tracker sampled and default flow tracker sampled commands remove the specified interface from the specified tracker.

**Command Mode**

Interface-Ethernet Configuration

**Command Syntax**

```
flow tracker sampled tracker_name
no flow tracker sampled tracker_name
default flow tracker sampled tracker_name
```

**Parameters**

- `tracker_name` the name of the flow tracker to which the interface is to be added.

**Example**

- This command configures Ethernet interface 1 to participate in the flow tracker ftr1.

```
switch(config)# interface ethernet 1
switch(config-if-Et1)# flow tracker sampled ftr1
switch(config-if-Et1)#
```
19.3.5.6 flow tracking sampled

The flow tracking sampled command places the switch in sampled flow tracking configuration mode. Sampled flow tracking configuration mode is a group-change mode; changes made in a group-change mode are saved by exiting the mode.

The no flow tracking sampled and default flow tracking sampled commands remove all sampled flow tracking configuration from running-config.

Command Mode
Global Configuration

Command Syntax
flow tracking sampled
no flow tracking sampled
default flow tracking sampled

Commands Available in Sampled Flow Tracking Configuration Mode

• abort exits mode without saving changes
• exit exits mode and saved changes
• sample configures sample parameters
• shutdown (sampled flow tracking) enables or disables sampled flow tracking
• tracker configures a flow tracker

Example
• This command places the switch in sampled flow tracking configuration mode.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)#
```
19.3.5.7 format ipfix version

The `format ipfix version` command configures the IPFIX version and maximum packet size for a specific exporter.

The `no format ipfix version` and `default format ipfix version` commands remove the previously configured IPFIX version and the maximum packet size value from `running-config`.

**Command Mode**
Sampled Flow Tracking Configuration

**Command Syntax**

```
format ipfix version ipfix_version [ max-packet-size max-packet-size value ]
no format ipfix version ipfix_version [ max-packet-size ]
default format ipfix version ipfix_version [ max-packet-size ]
```

**Parameters**

- `ipfix_version` the IPFIX version. Default value is 10.
- `max-packet-size` `max-packet-size value` the IPFIX maximum packet size. Value ranges from 512 to 65472. Default value is 9152.

**Example**

- These commands configure an IPFIX version of 10 and a maximum packet size of 854 for the exporter `exp1`.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftrl
switch(config-ftr-sampled-tr-ftrl)# exporter expl
switch(config-ftr-sampled-tr-ftrl-exp-expl)# format ipfix version 10
max-packet-size 854
```
19.3.5.8  **local interface**

The `local interface` command configures the local source interface for the specific exporter.

The `no local interface` and `default local interface` commands remove the local interface for the specific exporter from **`running-config`**.

**Command Mode**

Sampled Flow Tracking Configuration

**Command Syntax**

```
local interface interface
no local interface
default local interface
```

**Parameters**

- **interface** Interface type and numbers. Options include:
  - Ethernet `eth_num` displays the information of the specified Ethernet interface. The value ranges from 1 to 64.
  - Loopback `lb_num` displays the information of the specified loop back interface. The value ranges from 0 to 2100.
  - Management `m_num` displays the information of the specified Management interface. The management port number ranges from 1 to 2.
  - Port-Channel `pc_num` displays the interface or sub-interface information of the specified port channel. The interface and sub-interface values of port channel ranges from <1-1000> and <1-2000> respectively.
  - Tunnel `t_num` displays the information of the specified tunnel. The value ranges from 0 to 255.
  - Vlan `vlan_num` displays the information of the specified VLAN interface. The value ranges from 1 to 4094.

**Example**

- These commands configure the local source interface Ethernet1 for the exporter `exp1`.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
```
19.3.5.9 record export on inactive timeout

The record export on inactive timeout command configures the interval at which inactive flow records time out and are exported for a flow tracker.

The no record export on inactive timeout and default record export on inactive timeout commands remove the timeout interval from running-config.

Command Mode

Sampled Flow Tracking Configuration

Command Syntax

record export on inactive timeout timeout_value

no record export on inactive timeout

default record export on inactive timeout

Parameters

- timeout_value the flow record inactive export timeout value in milliseconds. Value ranges from 3000 to 900000. The default value is 15000 milliseconds.

Example

- These commands configure an inactive record interval of 6000 for the exporter exp1.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter expl
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on inactive timeout
6000
```
19.3.5.10  record export on interval

The `record export on interval` command configures the interval at which active flow records are exported for a flow tracker.

The `no record export on interval` and `default record export on interval` commands remove the interval from `running-config`.

**Command Mode**

Sampled Flow Tracking Configuration

**Command Syntax**

`record export on interval interval_value`

`no record export on interval`

`default record export on interval`

**Parameters**

- `interval_value` the flow record export interval in milliseconds. Value ranges from 5000 to 36000000. The default value is 300000 milliseconds.

**Example**

- These commands configure an active record interval of 9000 for the exporter `exp1`.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# record export on interval 9000
```
19.3.5.11 **sample**

The `sample` command enables the sample rate for a specific sampled flow tracker. The `no sample` and `default sample` commands remove the sample rate configured for a specific sampled flow tracker from *running-config*.

**Command Mode**
Sampled Flow Configuration

**Command Syntax**

```
sample sample_rate
no sample
default sample
```

**Parameters**

- `sample_rate` the sample flow tracking rate to be assigned for a sampled flow tracker. Value ranges from 1024 to 16777216. Default value is 1048576.

**Example**

- These commands configure a sample rate of 2056 for the sampled flow tracker.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# sample 2056
```
19.3.5.12  show flow tracking sampled counters

The `show flow tracking sampled counters` command displays information about the flow tracking counters of a specific tracker and the counters of a specified exporter within that tracker.

**Command Mode**

EXEC

**Command Syntax**

```
show flow tracking sampled counters [ tracker tracker_name [ exporter exporter_name ] ]
```

**Parameters**

- `tracker tracker_name` the specific flow tracker.
- `exporter exporter_name` the specific exporter within the tracker.

**Examples**

- This command displays the flow tracking counter information of the tracker ftr1 and the exporter exp1.

```
switch# show flow tracking sampled counters tracker ftr1 exporter exp1
Tracker: ftr1
  1 flows, 22 RX packets
  Flows created: 1, expired: 0
  Group: IPv4
  1 flows, 22 RX packets
  Group: IPv6
  0 flows, 0 RX packets
  Exporter: exp1 (IPFIX)
  Collector: 172.31.24.133 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
Collector: 172.31.22.131 port 4739
  52 messages, last sent 0:00:27 ago
  0 flow records
  2350 options data records, last sent 0:00:27 ago
  6 templates, last sent 0:12:27 ago
```
19.3.5.13  show flow tracking sampled flow-table

The `show flow tracking sampled flow-table` command displays information about the active flows maintained in the EOS.

**Command Mode**
EXEC

**Command Syntax**
```
show flow tracking sampled flow-table [ detail | dst-ip | dst-port | group | interface | protocol | src-ip | src-port | tracker | vlan | vrf ]
```

**Parameters**
- `detail` displays detailed flow records.
- `dst-ip` displays flow records based on destination IPv4 or IPv6 address.
- `dst-port` displays flow records based on a specified destination port.
- `group` displays flow records based on IPv4 or IPv6 flow groups.
- `interface` displays flow records based on ingress interface.
- `protocol` displays flow records based on the flow IP protocol.
- `src-ip` displays flow records based on source IPv4 or IPv6 address.
- `src-port` displays flow records based on a specified source port.
- `tracker` displays flow records based on flow tracker.
- `vlan` displays flow records based on a specified flow VLAN ID.
- `vrf` displays flow records based on flow VRF.

**Examples**
- This command displays information about the active flows on the device.
  ```
  switch# show flow tracking sampled flow-table
  Tracker: ftr1, Flows: 1
  Group: IPv4, Flows: 1
  VRF VLAN Source Destination Protocol Start TimePkts Bytes
  ---- ------ -------------- ------------- ---------- --------------------
  red 42 10.10.1.1:0 10.20.1.2:0 UDP 2019-04-18 15:06:50 7 700
  ```
- This command displays detailed information about the active flows on the device.
  ```
  switch# show flow tracking sampled flow-table detail
  Tracker: ftr1, Flows: 1
  Group: IPv4, Flows: 1
  Flow: UDP 10.10.1.1:0 - 10.20.1.2:0, VRF: red, VLAN: 42
  15:07:03.607900
  Packets: 15, Bytes: 1500, TOS: 0, TCP flags: none
  Source MAC: 001c.73ee.bfe4, Destination MAC: 001c.7374.3b85
  Ingress Interface: 'Ethernet1', Egress VLAN: routed, Egress Interface: CPU
  Next hop: unknown, BGP next hop: unknown (AS unknown), Source AS:
  unknown
  Source prefix length: 24, Destination prefix length: 32
  ```
19.3.5.14  show flow tracking sampled ipfix options-table

The `show flow tracking sampled ipfix options-table` command displays information about the sampled IPFIX options table available.

Command Mode
EXEC

Command Syntax
`show flow tracking sampled ipfix options-table tracker [ flow-key | flow-tracker | interface | vrf ]`

Parameters
- `tracker` displays the output for a specific flow tracker.
- `flow-key` displays the flow keys options table.
- `flow-tracker` displays the flow tracker options table.
- `interface` displays the interface options table.
- `vrf` displays the VRF options table.

Examples
- This command displays the sampled IPFIX options table for the tracker `ftr1`.

```bash
switch# show flow tracking sampled ipfix options-table
Tracker: ftr1
  Observation domain: ftr1, ID: 1
  Active interval: 30sec
  Inactive timeout: 120sec
  Selector algorithm: random(3)
  Sampling: 1/1024
  Flow tracking type: sampled(1)
  VRF Table, Template ID: 256, Scope: ingressVRFID
  VRF ID   VRF Name
  --------- --------
    0   default
    1     red
    16777215
  Interface Table, Template ID: 257, Scope: ingressInterface
  Interface ID Interface Name
  ------------------ ----------------
    0   unknown
    3013  Ethernet1
    3014  Ethernet2
    1073741823 CPU
    1073741824 discard
    1074029945 Ethernet3/36/1.1
    1074292089 Ethernet3/36/1.2
    2147483648 multicast
  Flow Keys Table, Template ID: 258, Scope: templateId
  Template ID Flow Key Indicator
  ----------------- ------------------
    261     0x7f
    262     0x7f
```
19.3.5.15 show flow tracking sampled ipfix template

The `show flow tracking sampled ipfix template` command displays information about the exported IPFIX data templates and options templates.

**Command Mode**
EXEC

**Command Syntax**
```
show flow tracking sampled ipfix template [ data | options | tracker ]
```

**Parameters**
- data displays the data templates.
- options displays the flow options template.
- tracker displays the flow tracker template.

**Example**
- This command displays the sampled IPFIX options table for the tracker `ftr1`.

```
switch# show flow tracking sampled ipfix template
Tracker: ftr1
Data Template, Group: IPv4, Fields: 26, Template ID: 261
  ingressVRFID (234), 4 bytes
  vlanId (58), 2 bytes
  sourceIPv4Address (8), 4 bytes
  destinationIPv4Address (12), 4 bytes
  protocolIdentifier (4), 1 byte
  sourceTransportPort (7), 2 bytes
  destinationTransportPort (11), 2 bytes
  sourceMacAddress (56), 6 bytes
  postDestinationMacAddress (57), 6 bytes
  octetDeltaCount (1), 8 bytes
  packetDeltaCount (2), 8 bytes
  flowStartMilliseconds (152), 8 bytes
  flowEndMilliseconds (153), 8 bytes
  flowEndReason (136), 1 byte
  tcpControlBits (6), 2 bytes
  ingressInterfaceType (368), 4 bytes
  ingressInterface (10), 4 bytes
  postVlanId (59), 2 bytes
  egressInterface (14), 4 bytes
  ipClassOfService (5), 1 byte
  bgpSourceAsNumber (16), 4 bytes
  bgpDestinationAsNumber (17), 4 bytes
  bgpNextHopIPv4Address (18), 4 bytes
  ipNextHopIPv4Address (15), 4 bytes
  sourceIPv4PrefixLength (9), 1 byte
  destinationIPv4PrefixLength (13), 1 byte

<--------OUTPUT OMITTED FROM EXAMPLE-------->
```
19.3.5.16  show flow tracking sampled

The `show flow tracking sampled tracker` command displays information about the status of a specific tracker and the status of a specified exporter within that tracker. If no tracker is specified in the command, then all information about all trackers is displayed.

**Command Mode**

EXEC

**Command Syntax**

```
show flow tracking sampled [ tracker tracker_name [ exporter exporter_name ]]
```

**Parameters**

- `tracker tracker_name` the specific flow tracker.
- `exporter exporter_name` the specific exporter within the tracker.

**Examples**

- This command displays the status information of the tracker ftr1 and the exporter exp1.

```
switch# show flow tracking sampled tracker ftr1 exporter exp1
Flow tracking status
  Type: Sampled
  Running: yes
  Sample rate: 1024
  Tracker: ftr1
  Active interval: 30000ms
  Inactive timeout: 120000ms
  Groups: IPv4, IPv6
  Exporter: exp1
  VRF: default
  Local interface: Management1 (172.30.150.179)
  Export format: IPFIX version 10, MTU 1500
  DSCP: 48
  Template interval: 3600000ms
  Collectors:
    172.31.22.131 port 4739
  Active interfaces:
    Et1
```
19.3.5.17  shutdown (sampled flow tracking)

The `shutdown` command disables sampled flow tracking for the specific exporter.

The `no shutdown` command enables sampled flow tracking for the specific exporter.

**Command Mode**

Sampled Flow Tracking Configuration

**Command Syntax**

- `shutdown`
- `no shutdown`
- `default shutdown`

**Example**

- These commands enable sampled flow tracking for the specific exporter `exp1`.

```bash
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# local interface Ethernet1
switch(config-ftr-sampled-tr-ftr1-exp-exp1)# no shutdown
```
19.3.5.18 template interval

The **template interval** command configures the interval at which templates are exported for a specific exporter. The default template interval is 3600000 milliseconds.

The **no template interval** and **default template interval** commands reset the interval rate to the default.

**Command Mode**

Sampled Flow Tracking Configuration

**Command Syntax**

```plaintext
template interval interval
no template interval
default template interval
```

**Parameters**

- **interval** the interval rate in milliseconds. The value ranges between 5000 and 3600000 milliseconds. The default rate is 3600000 milliseconds.

**Example**

- This command configures the interval of 3400000 milliseconds for the exporter *exp1*.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
switch(config-ftr-sampled-tr-ftr1)# exporter exp1
switch(config-ftr-sampled-tr-exp-ftr1-exp1)# template interval 3400000
```
19.3.5.19  tracker

The `tracker` command configures a sampled flow tracker for a device. The `no tracker` and `default tracker` commands remove the sampled flow tracker from the running config.

**Command Mode**
Sampled Flow Configuration

**Command Syntax**

```
tracker tracker_name
no tracker tracker_name
default tracker tracker_name
```

**Parameters**
- `tracker_name` the flow tracker name.

**Example**
- These commands configure the sampled flow tracker `ftr1`.

```
switch(config)# flow tracking sampled
switch(config-flow-tracking-sampled)# tracker ftr1
```

19.4  sFlow

This chapter describes Arista’s implementation of sFlow, including configuration instructions and command descriptions. Topics covered by this chapter include:
- sFlow Conceptual Overview
- sFlow Configuration Procedures
- sFlow Subinterfaces
- sFlow Configuration Commands

19.4.1  sFlow Conceptual Overview

19.4.1.1  sFlow Technology

sFlow is a multi-vendor sampling technology that continuously monitors application level traffic flow at wire speed simultaneously on all interfaces. sFlow provides gigabit speed quantitative traffic measurements without impacting network performance.

sFlow has the following network traffic monitoring characteristics:
- sFlow provides a network view of active route usage that measures network traffic.
- sFlow is scalable to 10 Gb/s without impacting switch performance or the network load.
- sFlow is implemented on a wide range of devices, without requiring additional memory and CPU.
- sFlow is an industry standard.

An sFlow configuration consists of:
- sFlow agents, embedded on network equipment, that monitor traffic and generate data.
- sFlow collectors that receive and analyze sFlow data.

Arista switches include an sFlow agent that monitors ingress data through all Ethernet interfaces.
19.4.1.1.1 sFlow Agents

The sFlow agent is a software process that runs as part of the network management software within an Arista switch. It combines interface counters and flow samples into sFlow datagrams that are sent to an sFlow collector. Packets typically include flow samples and state information of the forwarding/routing table entries associated with each sample. Additional data can be gathered for entries originated by BGP.

The sFlow Agent performs minimal processing when packaging data into datagrams. Immediate data forwarding minimizes agent memory and CPU requirements.

19.4.1.1.2 sFlow Collector

An sFlow collector is a server that runs software that analyzes and reports network traffic. Collectors receive flow samples and counter samples respectively as sFlow datagrams from sFlow agents.

Arista switches reference a collector's IP address and UDP port as a configurable setting through a CLI command. Arista switches do not include sFlow collector software.

19.4.1.1.3 sFlow Data

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched flows and time-based sampling of network interface statistics.

- **Switched flow sampling**: A sample is taken by either copying the packet's header or extracting feature data from the packet.
- **Interface statistics sampling**: Counter sampling extracts statistics by periodically polling each data source on the device.

sFlow implements flow sampling and counter sampling as part of an integrated system. An sFlow datagram incorporates both sample types.

19.4.1.2 Arista sFlow Implementation

Arista switches provide a single sFlow agent instance that samples ingress traffic from all Ethernet and port channel interfaces. The switch provides two levels of settings for enabling sFlow:

- a global setting that enables packet sampling on the entire switch.
- interface settings that control sampling on individual interfaces when sFlow is globally enabled.

sFlow default settings include:

- global: sFlow and BGP sFlow export are globally disabled.
- Ethernet and port channel interfaces: sFlow is enabled on all interfaces when it is enabled globally. BGP sFlow export is likewise enabled on all interfaces when it is enabled globally.

The switch performs sFlow polling when sFlow is globally enabled. The CLI provides commands that globally disable sampling while counter polling remains enabled. Sample enabling is not controllable on individual interfaces.

The switch sends sFlow datagrams to the collector located at an IP address specified by a global configuration command. If the collector destination is not configured, the switch samples data without transmitting the resulting datagrams.

Although the CLI enforces the configured sampling rate limit, it may drop samples if it cannot handle the number of samples it receives over a specified period. Under normal operation, the maximum packet sample rate is one per 16384 packets. The CLI allows for higher sampling rates by using the dangerous keyword.

The switch can also be configured to allow the routing agent to export BGP information to the sFlow agent. When BGP sFlow export is enabled, sFlow will add BGP information to packets whose destination is a BGP route.
The following lists describe sFlows sampling behavior relative to different packet types:

- **Packets that are sampled:**
  - CPU
  - IP Options and MTU violations
  - Flooded packets
  - Multicast packets
- **Packets that are not sampled:**
  - LACP frames
  - LLDP frames
  - STP BPDUs
  - IGMP packets
  - PAUSE frames
  - PIM hello packets
  - CRC error frames
  - Packets dropped by ACLs or due to VLAN violations

### 19.4.1.3 sFlow and Mirroring

The sFlow and Mirroring is supported using the same interface for both a mirroring session and sFlow at the same time. But when sFlow and mirroring is configured on the same interface, the TAP Aggregation is not supported. And when TAP Aggregation mode is enabled, the interface configured as a source for both a mirroring session and sFlow will only mirror packets, and sFlow samples are not produced.

The sFlow and Mirroring are supported on the following switch series:

However, the following switches have a limitation:

When a mirroring session and sFlow is configured on a same interface for the above devices, the following packet types are not sampled though they are sampled with only sFlow.

- STP BPDUs
- LACP frames
- LLDP frames
- OSPF packets
- PIM HELLO packets
- Packets dropped due to VLAN violations

### 19.4.2 sFlow Configuration Procedures

Implementing sFlow on an Arista switch consists of configuring the following agent parameters:

1. Collector location address.
2. Agent source address.
3. Polling interval.
4. Sampling rate.

Optionally, sFlow can be configured to include output interface and traffic class information in samples using the `sflow sample` command, and to include BGP information in samples whose destination is a BGP route using the `sflow extension bgp` command.

After configuring the sFlow agent, sampling is initiated by globally enabling sFlow on the switch.
Platform-specific Considerations
When BGP sFlow export is enabled on Arad platform switches (DCS-7280E and DCS-7500E), BGP information can be added to some sFlow packets with ECMP destinations.

DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Configuring the Collector Location
The sflow destination command specifies the IP address and UDP port of an sFlow collector. The switch supports multiple collectors.

Example
- This command configures the switch to send sFlow data to collectors at 10.42.15.12, port 6100 and 10.52.12.2 port 6343 (the default sFlow port).
  
  ```
  switch(config)#sflow destination 10.42.15.12 6100
  switch(config)#sflow destination 10.52.12.2
  switch(config)#
  ```

Configuring the Agent Source Address
The sflow source command specifies the source address that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example
- This command configures 10.2.9.21 as the sFlow source address.
  
  ```
  switch(config)#sflow source 10.2.9.21
  switch(config)#
  ```

The sflow source-interface command can be alternatively used to specify the interface from which an IP address is derived that the switch places in all sFlow datagrams that it sends to the collector. This address is normally set to an IP address configured on the switch.

Example
- This command configures VLAN interface 25 as the sFlow source interface. The switch enters the IP address for VLAN 25 in the source field of sFlow datagrams.
  
  ```
  switch(config)#sflow source-interface vlan 25
  switch(config)#
  ```

running-config cannot simultaneously contain sflow source and sflow source-interface commands.

Configuring the Polling Interval
The sflow polling-interval command specifies the interval for sending counter data to the sFlow collector. The default interval is two seconds.

Example
- This command configures the switch to send sFlow data every ten seconds.
  
  ```
  switch(config)#sflow polling-interval 10
  switch(config)#
  ```
Visibility and Monitoring Services

Configuring the Sampling Rate and Sample Contents

The `sflow sample` command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The default rate is 1048576.

**Example**

- This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).

```
switch(config)#sflow sample 65536
switch(config)#
```

The `sflow sample` command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

By default, samples include information about the output interface. To remove this information, use the `[no] sflow sample output interface` command.

- These commands configure sFlow to include traffic class information in samples but to exclude output interface data.

```
switch(config)#no sflow sample output interface
switch(config)#sflow sample rewrite dscp
switch(config)#
```

Enabling BGP sFlow Export

The `sflow extension bgp` command enables BGP sFlow export. When it is enabled, the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
  - AS numbers
  - AS system path to the destination
  - communities
  - local pref

On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export will also add the above BGP information to sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of 0.

On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as 0.

**Note:** A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol(BGP) chapter for details.

**Example**

- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

```
switch(config)#router bgp 50
switch(config-router-bgp)#exit
switch(config)#sflow extension bgp
switch(config)#
```
Extended Switch and Router Information

By default, extended switch and router information is added to sFlow sample packets.

Extended switch information includes the following:

- source and destination VLANs and priorities

Extended router information includes the following:

- IP version and address of next-hop router
- source and destination mask lengths

The `no` form of `sflow extension switch` and `no` form of `sflow extension router` commands prevent the addition of extended switch and router information to sFlow sample packets.

Example

- These commands prevent extended switch and router information from being added to sFlow sample packets.

```
switch(config)#no sflow extension switch
switch(config)#no sflow extension router
switch(config)#
```

Enabling sFlow

The `sflow run` command globally enables sFlow on the switch. The `sflow enable` command controls sFlow operation on Ethernet and port channel interfaces when sFlow is globally enabled. The `sflow enable` command has no effect when sFlow is globally disabled.

Example

- These commands enable sFlow on the switch, then disables sFlow on Ethernet interface 10.

```
switch(config)#sflow run
switch(config)#interface ethernet 10
switch(config-if-Et10)#no sflow enable
switch(config)#
```

19.4.3 sFlow Subinterfaces

The `sflow sample [ input | output ] subinterface` command configures ifIndex values for subinterfaces on input and output ports to be included in the flow sample. These values are in place of the default parent port ifIndex value. Enabling this feature changes all sFlow samples generated by the switch from the compact to the expanded format.

Configuring sFlow Subinterface

The following configures subinterfaces on the switch for sampling.

```
switch (config)# sflow run
switch (config-if-Et1)# sflow sample input subinterface
switch (config)# sflow sample output subinterface
```

The following file extract displays the output from a `show sflow detail` command.

```
switch# show sflow detail
...  
Status
```
Limitations

- The feature is supported only on some hardware platforms.
- Only L3 subinterfaces and QinQ L3 subinterfaces support the sFlow output subinterface.
- Tunneled packets such as GRE, MPLSoGRE, and IPinIP are not supported.
19.4.4 sFlow Configuration Commands

This section contains descriptions of sFlow commands.

Global Configuration Commands
- sflow extension bgp
- sflow extension router
- sflow extension switch
- sflow destination
- sflow polling-interval
- sflow run
- sflow sample
- [no] sflow sample output interface
- sflow source
- sflow source-interface

Interface Configuration Commands
- sflow enable

Privileged EXEC Command
- clear sflow counters

sFlow Display Commands
- show sflow
- show sflow interfaces
19.4.4.1 clear sflow counters

The `clear sflow counters` command resets the global sFlow statistics, which includes the number of samples and sample pool. The hardware trigger count is not reset.

The `show sflow` command displays global sFlow statistics.

Command Mode
Privileged EXEC

Command Syntax
`clear sflow counters`

Example
- This command resets the sFlow counters.

```
switch#clear sflow counters
switch#
```
19.4.4.2  [no] sflow sample output interface

By default, sFlow samples include information about the output interface of the sampled packet. The `no sflow sample output interface` command prevents sFlow from including that information.

Command Mode
Global Configuration

Command Syntax
`no sflow sample output interface`

Examples
• This command configures sFlow to not include output interface information in samples.

```sql
switch(config)#no sflow sample output interface
switch(config)#
```
19.4.4.3 sflow destination

The sflow destination command specifies an sFlow collector IP address and UDP port. The switch supports sFlow collector addresses through multiple sFlow destination commands in running-config.

The no sflow destination and default sflow destination commands remove the specified sFlow collector IP address by deleting the corresponding sflow destination command from running-config.

Command Mode
Global Configuration

Command Syntax
sflow destination dest_addr [UDP_PORT]
no sflow destination dest_addr [UDP_PORT]
default sflow destination dest_addr [UDP_PORT]

Parameters
• dest_addr sFlow collectors IP address.
• UDP_PORT sFlow collectors data reception port. Options include:
  • <No parameter> port number 6343 (default).
  • port_num port number. Value ranges from 0 to 65535.

Example
• This command configures the switch to send sFlow data to the collector located at 10.42.15.12; the collector receives the data through UDP port 6100.

switch(config)#sflow destination 10.42.15.12 6100
switch(config)#
The `sflow enable` command enables sFlow on the configuration mode interface when sFlow is globally enabled. By default, sFlow is enabled on all interfaces when sFlow is globally enabled (`sflow run`). The `sflow enable` command is required only when `running-config` contains a `no sflow enable` statement for the specified interface.

The `no sflow enable` command disables sFlow on the configuration mode interface. When sFlow is globally disabled, this command persists in `running-config` but has no effect on switch operation.

The `default sflow enable` command removes the corresponding `no sflow enable` command from `running-config` enabling sFlow capability on the interface.

**Command Mode**
- Interface-Ethernet Configuration
- Interface-Port-Channel Configuration

**Command Syntax**
- `sflow enable`
- `no sflow enable`
- `default sflow enable`

**Examples**
- These commands enable sFlow on the switch and disable sFlow on Ethernet interface 12.

```plaintext
switch(config)#sflow run
switch(config)#interface ethernet 12
switch(config-if-Et12)#no sflow enable
switch(config-if-Et12)#
```

- This command removes the `no sflow enable` command for Ethernet interface 12 from `running-config`, enabling sFlow on the interface whenever sFlow is globally enabled.

```plaintext
switch(config-if-Et12)#sflow enable
switch(config-if-Et12)#
```
19.4.4.5  sflow extension bgp

The sflow extension bgp command enables BGP export to sFlow. When enabled, this feature the routing agent will export the BGP routing table and autonomous system path information to the sFlow agent. When sFlow receives a sampled packets whose destination is a BGP route, it will look up the following additional BGP routing information and include it in the sample:

- next hop IP
  - AS numbers
  - AS system path to the destination
  - communities
  - local pref

The no sflow extension bgp and default sflow extension bgp commands disable BGP export to sFlow by deleting the corresponding sflow extension bgp command from running-config.

Note: A BGP instance must be configured on the switch for BGP sFlow export to operate. See the Border Gateway Protocol chapter for details.

Command Mode
Global Configuration

Command Syntax

- sflow extension bgp
- no sflow extension bgp
- default sflow extension bgp

Guidelines

BGP sFlow export behaves differently on different switch platforms as follows:

- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.
- On Arad platform switches (DCS-7280E and DCS-7500E), BGP sFlow export works for sample packets with ECMP destination routes unless they exit the switch via a trunk port or subinterface. When egress port is a trunk port or subinterface, the sample packet will only include AS path information from the first path of the ECMP route and a BGP next hop of 0.
- On all other switch platforms, ECMP destination routes will include AS path information from the first path, but will identify the BGP next hop as 0.
- DCS-7500E switches use actual hardware egress port information in sFlow packets. All other platforms use software simulation to determine the egress port.

Example

- These commands configure a BGP instance in AS 50 and enable BGP sFlow export globally.

  switch(config)#router bgp 50
  switch(config-router-bgp)#exit
  switch(config)#sflow extension bgp
  switch(config)#
19.4.4.6 sflow extension router

By default, the switch provides extended router information in sFlow packets, including the IP version and address of the next-hop router and source and destination mask lengths.

The no version of the sflow extension router command prevents this information from being included in sFlow packets.

The sflow extension router and default sflow extension router commands restore the default behavior by deleting the corresponding no sflow extension router command from running-config.

Command Mode
Global Configuration

Command Syntax
sflow extension router
no sflow extension router
default sflow extension router

Example
• This command prevents the switch from including extended router information in sFlow packets.

switch(config)#no sflow extension router
switch(config) #
19.4.4.7  sflow extension switch

By default, the switch provides extended switch information in sFlow packets, including source and destination VLANs and priorities.

The no version of the sflow extension switch command prevents this information from being included in sFlow packets.

The sflow extension switch and default sflow extension switch commands restore the default behavior by deleting the corresponding no sflow extension switch command from running-config.

Command Mode
Global Configuration

Command Syntax
- sflow extension switch
- no sflow extension switch
- default sflow extension switch

Example
- This command prevents the switch from including extended switch information in sFlow packets.

```plaintext
switch(config)#no sflow extension switch
switch(config)#
```
19.4.4.8  sflow polling-interval

The `sflow polling-interval` command specifies the counters polling interval. The switch uses this interval to schedule a ports counter data transmissions to the sFlow collector.

The default interval is two seconds.

The `no sflow polling-interval` and `default sflow polling-interval` commands revert the polling interval to the default of two seconds by removing the `sflow polling-interval` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
sflow polling-interval  interval_period
no sflow polling-interval
default sflow polling-interval
```

**Parameters**

- `interval_period` polling interval (seconds). Value ranges from 0 to 3600 (60 minutes). Default is 2.

**Example**

- This command configures the switch to send sFlow counter data every ten seconds.

```
switch(config)#sflow polling-interval 10
switch(config)#
```
### 19.4.4.9 sflow run

The `sflow run` command globally enables sFlow on the switch. The default sFlow global setting is **disabled**. sFlow cannot be enabled on individual interfaces when it is globally disabled.

The `sflow enable` interface configuration command controls sFlow operation on individual Ethernet and port channel interfaces when sFlow is globally enabled. When sFlow is enabled globally, sFlow is also enabled on all interfaces by default.

The `no sflow run` and `default sflow run` commands globally disable sFlow on the switch.

#### Command Mode

Global Configuration

#### Command Syntax

```
sflow run
no sflow run
default sflow run
```

#### Examples

- This command enables sFlow on the switch.

```
switch(config)#sflow run
switch(config)#
```

- This command globally disables sFlow.

```
switch(config)#no sflow run
switch(config)#
```
19.4.4.10  sflow sample

The sflow sample command sets the packet sampling rate. Packets are sampled at random intervals to avoid inaccurate sampling of periodic events; the packet sampling rate defines the average number of ingress packets that pass through an interface for every packet that is sampled. A rate of 16384 corresponds to an average sample of one per 16,384 packets. The switch may drop samples if it cannot handle the configured sample rate. Under normal operation, the maximum packet sample rate is one per 16384 packets. Higher sampling rates can be specified with the dangerous option.

By default, samples include information about the output interface. To remove this information, use the [no] sflow sample output interface command.

The sflow sample command can also optionally configure sample packets to include information about the traffic class of the sample. Traffic class is communicated by rewriting the DSCP field in the sample packet.

The no sflow sample and default sflow sample commands reset the packet sampling rate to the default of 1,048,576 and remove output interface and traffic class information from samples by removing the sflow sample command from the configuration.

Command Mode
Global Configuration

Command Syntax
sflow sample  TRUNCATE SAMPLE_RATE  [rewrite dscp]
no sflow sample
default sflow sample

Parameters

• SAMPLE_RATE size of the packet sample from which one packet is selected. Default sample size is 1048576 packets. Options include:
  • recommended_rate  Integer between 16384 to 16777215.
  • dangerous any_rate permits overriding the recommended range of sampling rates. The any_rate value range varies by platform:
    fm6000 1 to 65535
    trident 1 to 16777216
  • rewrite dscp  configures sFlow to rewrite the DSCP field of sample packets to indicate the traffic class of the original packet.
  • TRUNCATE sFlow sample truncation size between the range of 128 to 512. By default, the sFlow sample truncate size is set to 128. Note, this option is hidden.

Examples
• This command configures the sFlow sampling rate as 65536 (one per 65,536 packets).

```
switch(config)#sflow sample 65536
switch(config)#
```

• This command configures the sFlow sampling rate as 256 (one per 256 packets).

```
switch(config)#sflow sample dangerous 25
switch(config)#
```

• This command configures sFlow to include traffic class information in samples.

```
switch(config)#sflow sample rewrite dscp
```
switch(config)#
19.4.4.11  sflow source

The `sflow source` command specifies the IP address used in the `Agent` address field of the IPv4 sFlow datagram that the switch sends to the collector. This command cannot be used if `running-config` contains an `sflow source-interface` command.

The `no sflow source` and `default sflow source` commands remove the `sflow source` command from `running-config`.

**Command Mode**
Global Configuration

**Command Syntax**

```
sflow source  source_addr
no sflow source
default sflow source
```

**Parameters**

- `source_addr` source IP address (dotted decimal notation).

**Example**

- This command configures 10.2.9.21 as the sFlow source address.

```
switch(config)#sflow source 10.2.9.21
switch(config)#
```
19.4.12 sflow source-interface

The `sflow source-interface` command specifies the source IP address that is set to the IP's of the specified interfaces that the switch sends to the collector. Both, the Agent address in the IPv4 sFlow datagram as well as the source IP address sent to the collector are specified in sFlow packet. This command cannot be used if `running-config` contains an `sflow source` command.

The `no sflow source-interface` and `default sflow source-interface` commands remove the `sflow source-interface` command from `running-config`.

Command Mode
Global Configuration

Command Syntax
```
sflow source-interface INT_NAME
no sflow source-interface
default sflow source-interface
```

Parameters
- **INT_NAME** Interface type and number. Options include:
  - `interface ethernet e_num` Ethernet interface specified by `e_num`.
  - `interface loopback l_num` Loopback interface specified by `l_num`.
  - `interface management m_num` Management interface specified by `m_num`.
  - `interface port-channel p_num` Port-Channel Interface specified by `p_num`.
  - `interface vlan v_num` VLAN interface specified by `v_num`.

Example
- This command configures the sFlow source address as the IP address assigned to the loopback 0 interface.

```
switch(config)#sflow source-interface loopback 0
switch(config)#
```
19.4.4.13  show sflow interfaces

The **show sflow interfaces** command displays the interfaces where sFlow is enabled. The **show sflow** command displays configured sFlow parameters, operational status, and statistics.

**Command Mode**

EXEC

**Command Syntax**

`show sflow interfaces`

**Examples**

- This command displays the show sflow interface message when sFlow is globally disabled.

```
switch#show sflow interfaces
sFlow Interface (s):
-------------------------
sFlow is not running
```

- This command displays the show sflow interface message when sFlow is globally enabled and enabled on all interfaces.

```
switch(config)#sflow run
switch(config)#show sflow interfaces
Default sFlow configuration for an interface: Disable
sFlow Interface (s):
-------------------------
Ethernet1  running(Counter)
Ethernet2  running(Counter)
Ethernet3  running(Flow,Counter)
Ethernet4  running(Flow,Counter)
Ethernet5  running(Flow,Counter)
```
19.4.14  show sflow

The `show sflow` command displays configured sFlow parameters, operational status, and statistics.

The `show sflow interfaces` command displays the interfaces where sFlow is enabled.

Command Mode

EXEC

Command Syntax

```
show sflow [detail]
```

Parameters

- `detail` adds hardware sampling status and number of discarded samples to the information displayed.

Example

- This command displays the base sFlow information.

```
switch#show sflow
! Displaying counters that may be stale
sFlow Configuration

This chapter describes the Arista switch SNMP agent and contains these sections:

- **SNMP Introduction**
- **SNMP Conceptual Overview**
- **Configuring SNMP**
- **SNMP Commands**

### 19.5.1 SNMP Introduction

Arista Networks switches support many standard SNMP MIBs, making it easier to integrate these platforms into existing network management infrastructures.
With only a few configurations, many public domain and commercially available network management tools can quickly manage Arista switches out of the box. Support of SNMP V2 groups and views and V3 security allow network managers to tune switch monitoring to match the administration policy of the IT organization.

19.5.2 SNMP Conceptual Overview

Simple Network Management Protocol (SNMP) is a protocol that provides a standardized framework and a common language to monitor and manage network devices.

19.5.2.1 SNMP Structure

The SNMP framework has three parts:

- **SNMP manager**: The SNMP manager controls and monitors network host activities and is typically part of a Network Management System (NMS).
- **SNMP agent**: The SNMP agent is the managed device component that manages and reports device information to the manager.
- **Management Information Base (MIB)**: The MIB stores network management information.

The agent and MIB reside on the switch. Enabling the SNMP agent requires the definition of the manager-agent relationship. The agent contains MIB variables whose values the manager can request or change. The agent gathers data from the MIB and responds to requests for information. For a list of supported MIBs, refer to the release notes for the specific EOS version.

This chapter discusses enabling the SNMP agent on an Arista switch and controlling notification transmissions from the agent. Information on using SNMP management systems is available in the appropriate documentation for the corresponding NMS application.

19.5.2.2 SNMP Notifications

SNMP notifications are messages, sent by the agent, informing of an event or a network condition. A **trap** is an unsolicited notification. An **inform** (or inform request) is a trap that includes a request for a confirmation that the message is received. Events that a notification can indicate include improper user authentication, restart, and connection losses.

For a list of supported traps, refer to the release notes for the specific EOS version.

19.5.2.3 SNMP Versions

Arista switches support the following SNMP versions:

- **SNMPv1**: The Simple Network Management Protocol, defined in RFC 1157. Security is based on community strings.
- **SNMPv2c**: Community-string based Administrative Framework for SNMPv2, defined in RFC 1901, RFC 1905, and RFC 1906. Security is based on SNMPv1.
- **SNMPv3**: Version 3, as defined in RFCs 2273 to 2275.

19.5.2.4 SNMP Authentication and Encryption Methods

The following are the SNMP stronger Authentication and Encryption methods:

- **Authentication**
  - MD5
  - SHA-1
  - SHA-224
  - SHA-256
  - SHA-384
• SHA-512
• Encryption
  • AES
  • DES
  • AES-192
  • AES-256

**Note:** Use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperability issues.
  • When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
  • When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

### 19.5.3 Configuring SNMP

This section describes the steps that configure the switch SNMP agent to communicate with an SNMP manager, including the following:

- Enabling and Disabling SNMP
- Enabling SNMP in a VRF
- Configuring Community Access Control
- Configuring SNMP Parameters
- Configuring the Agent to Send Notifications
- Extending the SNMP Agent Through Runtime Scripts
- SNMP Traps for MAC Move, Learn, and Age Events
- SNMP IP Address ACL Support

#### 19.5.3.1 Enabling and Disabling SNMP

SNMP is enabled globally by issuing any `snmp-server community` or `snmp-server user` command. The `no snmp-server` command disables SNMP agent operation by removing all non-default `snmp-server` commands from `running-config`.

#### 19.5.3.2 Enabling SNMP in a VRF

By default, SNMP is enabled only in the default VRF. The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled.

To enable or disable SNMP in a VRF, use the `snmp-server vrf` command.

#### 19.5.3.3 Configuring Community Access Control

SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. A Network Management System (NMS) can access the switch only if its community string matches at least one of the switch’s community strings.

The `snmp-server community` command configures the community string.

**Example**

This command adds the community string `ab_1` to provide read-only access to the switch agent.

```
switch(config)#snmp-server community ab_1 ro
switch(config)#
```
Community statements can reference views to limit MIB objects that are available to a manager. A view is a community string object that specifies a subset of MIB objects. The `snmp-server view` command configures the community string.

**Examples**

- These commands create a view that includes all objects in the `system` group except for those in `system.2`.

```plaintext
switch(config)# snmp-server view sys-view system include
switch(config)# snmp-server view sys-view system.2 exclude
```

- This command adds the community string `lab_1` to provide read-only access to the switch agent for the previously defined view.

```plaintext
switch(config)# snmp-server community lab_1 view sys-view
```

### 19.5.3.4 Configuring SNMP Parameters

This section describes these SNMP parameter configuration tasks:

- Configuring the Engine ID
- Configuring the Group
- Configuring the User
- Configuring the Host
- Enabling Link Trap Generation
- Specifying the Source Interface
- Configuring the Chassis-id String
- Configuring the Contact String
- Configuring the Location String

#### 19.5.3.4.1 Configuring the Engine ID

The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. Use the `snmp-server engineID local` command for the local engine.

A remote agent's engine ID must be configured before remote users for that agent are configured. User authentication and privacy digests are derived from the engine ID and user passwords. The configuration command fails if the remote engine ID is not configured first.

**Note:** When the remote engine ID is changed, all user passwords associated with the engine must be reconfigured.

**Example**

This command configures DC945798CAB4 as the name of the remote SNMP engine located at 12.23.104.25, UDP port 162.

```plaintext
switch(config)# snmp-server engineID remote 10.23.104.25 udp-port DC945798CA
```
19.5.3.4.2 Configuring the Group

An SNMP group grants specific levels of SNMP access to group users. The `snmp-server group` command configures a new SNMP group.

This command configures `normal_one` as an SNMPv3 group (authentication and encryption) that provides access to the `all-items` read view.

```
switch(config)# snmp-server group normal_one v3 priv read all-items
```

19.5.3.4.3 Configuring the User

Members of SNMP groups are called *users*. The `snmp-server user` command allows a new user to be added to an SNMP group and configures that user's parameters. Remote users are configured by specifying the IP address or port number that accesses the user's SNMP agent.

**Example**

- This command configures the local SNMPv3 user `tech-1` as a member of the SNMP group `tech-sup`.

  ```
  switch(config)# snmp-server user tech-1 tech-sup v3
  switch(config)#
  ```

- This command configures the remote SNMPv3 user `tech-2` as a member of the SNMP group `tech-sup`. The remote user is on the agent located at `13.1.1.4`.

  ```
  switch(config)# snmp-server user tech-2 tech-sup remote 13.1.1.4 v3
  switch(config)#
  ```

19.5.3.4.4 Configuring the Host

The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent). The `snmp-server host` command sets the community string if it was not previously configured.

**Example**

This command adds a v2c inform notification recipient at `12.15.2.3` using the community string `comm-1`.

```
switch(config)# snmp-server host 12.15.2.3 informs version 2c comm-1
switch(config)#
```

19.5.3.4.5 Enabling Link Trap Generation

The `snmp trap link-change` command enables SNMP link trap generation on the configuration mode interface. SNMP link trap generation is enabled by default. If SNMP link trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration. The `show snmp notification` command displays the SNMP link trap generation information.

**Example**

This command disables SNMP link trap generation on the `Ethernet 5` interface.

```
switch(config-if-Et5)# no snmp trap link-change
switch(config-if-Et5)#
```
19.5.3.4.6 Specifying the Source Interface

The `snmp-server local-interface` command specifies the interface from where an SNMP trap originates. The `show snmp local-interface` command displays the interface of the IP address for SNMP traps.

**Example**

This command configures the *Ethernet 1* interface as the source of SNMP traps and informs.

```
switch(config)#snmp-server local-interface ethernet 1
switch(config)#
```

19.5.3.4.7 Configuring the Chassis-id String

The chassis ID string is typically set to the serial number of the switch. The SNMP manager uses this string to associate all data retrieved from the switch with a unique identifying label. Under normal operating conditions, editing the chassis ID string contents is unnecessary.

The `snmp-server chassis-id` command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The `show snmp` command displays the chassis ID.

**Example**

This command configures *xyz-1234* as the chassis-ID string, then displays the result.

```
switch(config)#snmp-server chassis-id xyz-1234
switch(config)#show snmp
Chassis: xyz-1234  <---chassis ID
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
21 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to tacoon.162
SNMP agent enabled
switch(config)#
```

19.5.3.4.8 Configuring the Contact String

The SNMP contact string is information text that typically displays the name of a person or organization associated with the SNMP agent.

The `snmp-server contact` command configures the system contact string. The contact string is displayed by the `show snmp` and `show snmp v2-mib contact` commands.

**Example**
These commands configure *Bonnie H at 3-1470* as the contact string.

```
switch(config)#snmp-server contact Bonnie H at 3-1470
```

**19.5.3.4.9 Configuring the Location String**

The location string typically provides information about the physical location of the SNMP agent. The `snmp-server location` command configures the system location string. By default, the system location string is not set.

**Example**

These commands configure *lab-25* as the location string.

```
switch(config)#snmp-server location lab_25
switch(config)#show snmp v2-mib location
Location: lab_25
switch(config)#
```

**19.5.3.5 Configuring the Agent to Send Notifications**

The following steps are mandatory when setting up the SNMP agent to send notifications:

1. Configure the remote engine ID.
2. Configure the group.
3. Configure the user.
4. Configure the host.
5. Enable link trap generation on the interfaces.

Configuring SNMP Parameters describes each of these tasks.

**19.5.3.6 Extending the SNMP Agent Through Runtime Scripts**

The switch supports the execution of user supplied scripts to service portions of the OID space.

Scripts run under one of two operational modes:

- **Normal mode** scripts run over an indefinite period to process subsequent objects after the initial request. Maintaining an executing script avoids startup and connection delay each time an object requires processing.
- **One-shot mode** scripts process a single object, then terminate execution; requires the one-shot keyword.

Startup and data collection overhead is required for each request. In both modes, the SNMP server is blocked from serving other requests when waiting for script responses.

The `snmp-server extension` command configures the execution of user-supplied scripts to service portions of the OID space. Use the one-shot keyword to specify one-shot execution.

**Examples**

- This command specifies the file *normal-example.sh*, located in flash as the script file that services the specified OID space in normal mode.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:normal-example.sh
switch(config)#
```
• Contents of the script file:

```bash
#!/bin/bash
while read cmd; do
  case $cmd in
    PING)
      printf "PONG\n"
    ;;
    get)
      read oid
      printf "$oid\n"
      printf "integer\n"
      printf "42\n"
    ;;
    *)
      printf "NONE\n"
      ;; esac
  esac
done
```

• Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
switch(config)#
```

• This command specifies the file `one-shot-example.sh`, located in flash as the script file that services the specified OID space in one-shot mode, executing once and then exiting.

```
switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2
flash:one-shot-example.sh one-shot
switch(config)#
```

• Contents of the script file:

```bash
#!/bin/bash
oid="$2"
printf "$oid\n"
printf "integer\n"
printf "42\n"
```

• Testing the script:

```
switch(config)#show snmp mib get .1.3.6.1.4.1.8072.2
NET-SNMP-EXAMPLES-MIB::netSnmpExamples = INTEGER: 42
```

19.5.3.6.1 Normal Script Behavior

The first time the SNMP server requires a script result, it launches it with no arguments. The server communicates with the script through stdin/stdout. Before each request, the script is sent the string PING\n on stdin. The expected response from the script is printing PONG\n to stdout.

GET and GETNEXT Requests

For GET and GETNEXT requests, the script is passed two lines on stdin, the command (get or getnext) and the requested OID. The expected response from the script is the printing of three lines to stdout: the OID for the result varbind, the TYPE, and the VALUE itself.

Table 77: Extension Script Type and Encoding lists legal TYPE values and resulting VALUE encodings. If the command does not return an appropriate varbind, it should print NONE\n to stdout and continue running; this results in an SNMP noSuchName error or a noSuchInstance exception.
Table 77: Extension Script Type and Encoding

<table>
<thead>
<tr>
<th>Type</th>
<th>SNMP type</th>
<th>Encoding for script</th>

</tr>
<tr>
<td>opaque</td>
<td>Opaque</td>
<td>hexadecimal string</td>
</tr>
<tr>
<td>string</td>
<td>OctetString</td>
<td>ascii string</td>
</tr>
</tbody>
</table>

SET Requests

For SET requests, script is passed three lines on stdin: the command (set), and the requested OID, and the TYPE and VALUE, both on the same line. If the assignment is successful, the expected script response is to print `DONE` to stdout. Indicated errors by writing one of the error strings described in Set Request Error Strings. In each case, the command should continue running.

Table 78: Set Request Error Strings

<table>
<thead>
<tr>
<th>Error String</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>authorization-error</td>
<td>no-access</td>
</tr>
<tr>
<td>bad-value</td>
<td>no-access</td>

<td>gen-error</td>
<td>no-creation</td>
</tr>
<tr>
<td>inconsistent-name</td>
<td>no-creatin</td>
</tr>
<tr>
<td>inconsistent-value</td>
<td>no-creatin</td>
</tr>
</tbody>
</table>

19.5.3.6.2 One-Shot Script Behavior

The command should exit after it finishes processing a single object.

GET and GETNEXT

For each GET or GETNEXT request, the script is invoked once for each OID in the space that it serves. It receives two arguments: -g for GET or -n for GETNEXT, and the requested OID.

The expected script response is the response varbind as three separate lines printed to stdout: the result OID, the type, and the value.

If the command does not return an appropriate varbind, then the script should exit without producing any output. This results in an SNMP **noSuchName** error, or a **noSuchInstance** exception.

Possible reasons that a command would not return an appropriate varbind includes:

- The specified OID didn't correspond to a valid instance for a GET request.
• There were no following instances for a GETNEXT.

SET

A SET request results in the command being called with the arguments: -s, OID, TYPE and VALUE, where TYPE is a listed token. Normal Script Behavior indicates the type of the value passed as the third parameter.

When the assignment is successful, the script exits without producing any output. Errors are indicated by writing just the error name (Normal Script Behavior); the agent generates the appropriate error response.

19.5.3.7 SNMP Traps for MAC Move, Learn, and Age Events

This feature adds three new SNMP traps for MAC move, learn, and age events: aristaMacMove, aristaMacLearn, and aristaMacAge, respectively. These are defined in the ARISTA-BRIDGE-EXT-MIB.

19.5.3.7.1 Platform Compatibility

SNMP traps for MAC move, learn, and age events are supported on all platforms.

19.5.3.7.2 Configuration

The aristaMacMove, aristaMacLearn, and aristaMacAge traps are disabled, by default. They may be enabled, like all traps, with the `snmp-server enable traps` command. They are grouped under the “bridge” category, so all can be enabled at once using the `snmp-server enable traps bridge` command, or each be enabled or disabled individually, as shown below:

```
switch(config)#snmp-server enable traps bridge ?
   arista-mac-age   Enable aristaMacAge trap
   arista-mac-learn Enable aristaMacLearn trap
   arista-mac-move  Enable aristaMacMove trap
switch(config)#snmp-server enable traps bridge arista-mac-age
switch(config)#no snmp-server enable traps bridge arista-mac-learn
```

In the above example, aristaMacAge traps are enabled, aristaMacLearn traps are disabled, and aristaMacMove traps have their default value, which is disabled.

19.5.3.7.3 Show Commands

You can display the enabled/disabled status of each trap type using the `show snmp notification` command. Continuing with the example from above:

```
switch(config)#show snmp notification | grep bridge
bridge       arista-mac-age   Yes
bridge       arista-mac-learn No
bridge       arista-mac-move  No
(aristaMacMove default disabled)
```
19.5.3.8 SNMP IP Address ACL Support

SNMP IP address ACL support provides the ability to add access-lists to limit the source addresses that can be used to query the SNMP server. The access-lists are reachable on the switch through the access SNMP data (port 161). The access-lists contain standard **permit** and **deny** commands.

19.5.3.8.1 Platform Compatibility

SNMP IP address ACL support is platform independent.

19.5.3.8.2 Configuration

Use the following command to add SNMP IP address ACL support:

```bash
[no | default] snmp-server [[ipv4 access-list IP4_ACL] | [ipv6 access-list IP6_ACL]][vrf VRF]
```

When the **VRF** is not specified, **default** is assumed.

19.5.3.8.3 Show Commands

Use the **show snmp ipv4 access-list summary** command to display an abbreviated output of an IPv4 access-list.

```
Example

switch#show snmp ipv4 access-list summary
IPv4 ACL Permit169
  Total rules configured: 2
  Configured on VRFs: red VRF
IPv4 ACL Permit168
  Total rules configured: 2
  Configured on VRFs: default VRF
Active on VRFs: default VRF
```

Use the **show snmp ipv4 access-list detail** command to display a detailed output of an IPv4 access-list.

```
Example

switch#show snmp ipv4 access-list detail
IP Access List Permit169
  10 permit ip 192.169.199.0/24 any [match 7 packets, 0:19:56 ago]
  20 deny ip any any [match 13 packets, 0:03:56 ago]
  Total rules configured: 2
  Configured on VRFs: red VRF
IP Access List Permit168
  10 permit ip 192.168.199.0/24 any [match 7 packets, 0:27:00 ago]
  20 deny ip any any [match 13 packets, 0:04:30 ago]
  Total rules configured: 2
  Configured on VRFs: default VRF
Active on VRFs: default VRF
```
Use the `show snmp ipv4 access-list IPv4ACL` command to display a configured access-list. In this example, the configured access-list is **Permit169**.

**Example**

```plaintext
switch#show snmp ipv4 access-list Permit169
IP Access List Permit169
 10 permit ip 192.169.199.0/24 any [match 7 packets, 0:20:12 ago]
 20 deny ip any any [match 13 packets, 0:04:12 ago]
Total rules configured: 2
Configured on VRFs: red VRF
```

Use the `show snmp ipv4 access-list summary` command to display a summary of an active access-list.

**Example**

```plaintext
switch#show snmp ipv4 access-list summary
! Same ACL configured in multiple VRFs. Both VRFs are listed in both the configured!
! and the active sessions
IPv4 ACL Permit169
Total rules configured: 2
Configured on VRFs: default VRF
  red VRF
Active on VRFs: default VRF
  red VRF
```

Use the `show snmp ip access-list summary` command to display a short output of the active access-lists.

**Example**

```plaintext
switch#show snmp ip access-list summary
IPv4 ACL Permit169
Total rules configured: 2
Configured on VRFs: default VRF
  red VRF
Active on VRFs: default VRF
```
19.5.4 SNMP Commands

Global Configuration Commands
- no snmp-server
- snmp-server chassis-id
- snmp-server community
- snmp-server contact
- snmp-server enable traps
- snmp-server enable traps bridge
- snmp-server engineID local
- snmp-server engineID remote
- snmp-server extension
- snmp-server group
- snmp-server host
- snmp-server local-interface
- snmp-server location
- snmp-server qosmib counter-interval
- snmp-server user
- snmp-server view
- snmp-server vrf

Interface Configuration Commands
- snmp trap link-change

Display Commands
- show snmp
- show snmp community
- show snmp engineID
- show snmp group
- show snmp local-interface
- show snmp mib
- show snmp notification host
- show snmp notification
- show snmp notification | grep bridge
- show snmp user
- show snmp v2-mib chassis
- show snmp v2-mib contact
- show snmp v2-mib location
- show snmp view
19.5.4.1  no snmp-server

The no snmp-server and default snmp-server commands disable Simple Network Management Protocol (SNMP) agent operation by removing all snmp-server commands from running-config.

SNMP is enabled with any snmp-server community or snmp-server user command.

Command Mode
Global Configuration

Command Syntax
no snmp-server
default snmp-server

Example
• This command disables SNMP agent operation on the switch.

switch(config)#no snmp-server
switch(config)#
19.5.4.2  show snmp community

The `show snmp community` command displays the Simple Network Management Protocol (SNMP) community access strings configured by the `snmp-server community` command.

**Command Mode**

EXEC

**Command Syntax**

`show snmp community`

**Example**

- This command displays the list of community access strings configured on the switch.

  ```
  switch>show snmp community
  Community name: public
  switch>
  ```
19.5.4.3  show snmp engineID

The `show snmp engineID` command displays the local SNMP engine information configured on the switch.

**Command Mode**

EXEC

**Command Syntax**

`show snmp engineID`

**Example**

- This command displays the ID of the local SNMP engine.

```
switch>show snmp engineid
Local SNMP EngineID: f5717f001c730436d700
switch>
```
19.5.4.4  show snmp group

The `show snmp group` command shows the names of configured SNMP groups along with the security model, and view status of each group.

**Command Mode**

EXEC

**Command Syntax**

```
show snmp group [GROUP_LIST]
```

**Parameters**

- GROUP_LIST the name of the group.
  - `<no parameter>` displays information about all groups.
  - `group_name` the name of the group.

**Field Descriptions**

- `groupname` name of the SNMP group.
- `security model` security model used by the group: `v1`, `v2c`, `orv3`.
- `readview` string identifying the group's read view. Refer to the `show snmp view` command.
- `writeview` string identifying the group's write view.
- `notifyview` string identifying the group's notify view. This command displays the groups configured on the switch.

**Example**

```
switch>show snmp group
    groupname : normal              security model: v3 priv
    readview  : all                  writeview: <no writeview specified>
    notifyview: <no notifyview specified>
switch>
```
19.5.4.5  show snmp local-interface

The show snmp local-interface command displays the interface whose IP address is the source address for SNMP traps.

Command Mode
EXEC

Command Syntax
show snmp local-interface

Example
This command displays the source interface for the SNMP notifications.

switch>show snmp local-interface
SNMP source interface: Ethernet1
switch>
show snmp mib

The show snmp mib command displays values associated with specified MIB object identifiers (OIDs) that are registered on the switch.

Command Mode
EXEC

Command Syntax

```
show snmp mib OBJECTS
```

Parameters

- OBJECTS object identifiers for which the command returns data. Options include:
  - get oid_1 [oid_2 ... oid_x] values associated with each listed OID.
  - get-next oid_1 [oid_2 ... oid_x] values associated with subsequent OIDs relative to listed OIDs.
  - table oid table associated with specified OID.
  - translate oid object name associated with specified OID.
  - walk oid objects below the specified subtree.

Example

- This command uses the get option to retrieve information about the sysORID.1 OID.

```
switch#show snmp mib get sysORID.1
SNMPv2-MIB::sysORID[1] = OID: TCP-MIB::tcpMIB
```

- This command uses the get-next option to retrieve information about the OID that is after sysORID.8.

```
switch#show snmp mib get-next sysORID.8
SNMPv2-MIB::sysORDescr[1] = STRING: The MIB module for managing TCP implementations
```
19.5.4.7  show snmp notification host

The `show snmp notification host` command displays information for Simple Network Management Protocol notification. Details include IP address and port number of the Network Management System, notification type, and SNMP version.

**Command Mode**
EXEC

**Command Syntax**
```
show snmp notification host
```

**Field Descriptions**
- Notification host IP address of the host.
- udp-port port number.
- type notification type.
- user access type of the user.
- security model SNMP version used.
- traps details of the notification.

**Example**
- This command displays the hosts configured on the switch.

```
switch>show snmp notification host
Notification host: 172.22.22.20  udp-port: 162  type: trap
user: public  security model: v2c
switch>
```

19.5.4.8  show snmp notification

The `show snmp notification` command displays the SNMP trap generation information.

**Command Mode**
EXEC

**Command Syntax**
```
show snmp notification
```

**Example**
This command displays the SNMP traps configured on the switch.

```
switch>show snmp notification
<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>entity</td>
<td>entConfigChange</td>
<td>Yes (default)</td>
</tr>
<tr>
<td>entity</td>
<td>entStateOperDisabled</td>
<td>Yes (default)</td>
</tr>
<tr>
<td>entity</td>
<td>entStateOperEnabled</td>
<td>Yes (default)</td>
</tr>
<tr>
<td>lldp</td>
<td>lldpRemTablesChange</td>
<td>Yes (default)</td>
</tr>
<tr>
<td>msdpBackwardTransition</td>
<td>msdpBackwardTransition</td>
<td>Yes</td>

<td>linkDown</td>
<td>Yes</td>
</tr>
<tr>
<td>snmp</td>
<td>linkUp</td>
<td>Yes</td>
</tr>
<tr>
<td>snmpConfigManEvent</td>
<td>aristaConfigManEvent</td>
<td>Yes (default)</td>
</tr>
<tr>
<td>switchover</td>
<td>aristaRedundancySwitchOverNotif</td>
<td>Yes</td>
</tr>
<tr>
<td>test</td>
<td>aristaTestNotification</td>
<td>Yes</td>
</tr>
</tbody>
</table>
switch>
```
19.5.4.9  show snmp notification | grep bridge

Use the `show snmp notification | grep bridge` command to display the enabled or disabled status of each trap type.

**Command Mode**

EXEC

**Command Syntax**

`show snmp notification | grep bridge`

**Example**

```
switch(config)#show snmp notification | grep bridge
bridge   arista-mac-age   Yes
bridge   arista-mac-learn No
bridge   arista-mac-move  No (aristaMacMove default disabled)
```
19.5.4.10  show snmp user

The `show snmp user` command shows information about Simple Network Management Protocol (SNMP) users. Information that the command displays about each user includes their SNMP version, the engine ID of the host where they reside, and security information.

**Command Mode**

EXEC

**Command Syntax**

```plaintext
show snmp user [USER_LIST]
```

**Parameters**

- **USER_LIST** the name of the group.
  - `<no parameter>` displays information about all users.
  - `user_name` specifies name of displayed user.

**Example**

This command displays information about the users configured on the switch.

```
switch>show snmp user
User name: test
Security model: v3
Engine ID: f5717f001c73010e0900
Authentication protocol: SHA
Privacy protocol: AES-128
Group name: normal
switch>
```
show snmp v2-mib chassis

The `show snmp v2-mib chassis` command displays the Simple Network Management Protocol (SNMP) server serial number or the chassis ID string configured by the `snmp-server chassis-id` command.

**Command Mode**
EXEC

**Command Syntax**
`show snmp v2-mib chassis`

**Example**
This command displays the chassis ID string.

```
switch> show snmp v2-mib chassis
Chassis: JFL08320162
switch>
```
19.5.4.12  show snmp v2-mib contact

The `show snmp v2-mib contact` command displays the Simple Network Management Protocol (SNMP) system contact string configured by the `snmp-server contact` command. The command has no effect if a contact string was not previously configured.

**Command Mode**

EXEC

**Command Syntax**

`show snmp v2-mib contact`

**Example**

This command displays the contact string contents.

```
switch>show snmp v2-mib contact
Contact: John Smith
switch>
```
19.5.4.13 show snmp v2-mib location

The `show snmp v2-mib location` command displays the Simple Network Management Protocol (SNMP) system location string. The `snmp-server location` command configures system location details. The command has no effect if a location string was not previously configured.

**Command Mode**

EXEC

**Command Syntax**

`show snmp v2-mib location`

**Example**

This command displays the location string contents.

```
switch>show snmp v2-mib location
Location: santa clara
switch>
```
19.5.4.14  show snmp view

The `show snmp view` command displays the information of a Simple Network Management Protocol configuration and the associated MIB. SNMP views are configured with the `snmp-server view` command.

**Command Mode**

EXEC

**Command Syntax**

`show snmp view [VIEW_LIST]`

**Parameters**

- **VIEW_LIST** the name of the view.
  - `<no parameter>` displays information about all views.
  - `view_name` the name of the view.

**Field Descriptions**

- **First column** view name.
- **Second column** name of the MIB object or family.
- **Third column** inclusion level of the specified family within the view.

**Example**

These commands configure an SNMP view, then displays that view.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
switch(config)#show snmp view
sys-view system - included
sys-view system.2 - excluded
```
19.5.4.15  show snmp

The show snmp command displays SNMP information including the SNMP counter status and the chassis ID string.

Command Mode
EXEC

Command Syntax
show snmp

Example
• This command displays SNMP counter status, the chassis ID, the previously configured location string, logging status and destination, and the VRFs in which the SNMP agent is operating.

```
switch>show snmp
Chassis: JFL08320162
Location: 5470ga.dc
2329135 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  38132599 Number of requested variables
  0 Number of altered variables
  563934 Get-request PDUs
  148236 Get-next PDUs
  0 Set-request PDUs
2329437 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  2329135 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
Logging to 172.22.22.20.162
SNMP agent configured in VRFs: default
SNMP agent enabled in default VRF
switch>
```
19.5.4.16  snmp trap link-change

The `snmp trap link-change` command enables Simple Network Management Protocol (SNMP) link-status trap generation on the configuration mode interface. The generation of link-status traps is enabled by default. If SNMP link-trap generation was previously disabled, this command removes the corresponding `no snmp link-status` statement from the configuration to re-enable link-trap generation.

The `no snmp trap link-change` command disables SNMP link trap generation on the configuration mode interface.

The `snmp trap link-change` and `default snmp trap link-change` commands restore the default behavior by removing the `no snmp trap link-change` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration Interface-Loopback Configuration Interface-Management Configuration Interface-Port-channel Configuration Interface-VLAN Configuration Interface-VXLAN Configuration

**Command Syntax**

- `snmp trap link-change`
- `no snmp trap link-change`
- `default snmp trap link-change`

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the `default` VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

This command disables SNMP link trap generation on the Ethernet 5 interface.

```
switch(config-if-Et5)#no snmp trap link-change
switch(config-if-Et5)#
```
19.5.4.17  snmp-server chassis-id

The snmp-server chassis-id command configures the chassis ID string. The default chassis ID string is the serial number of the switch. The show snmp command displays the chassis ID.

The no snmp-server chassis-id and default snmp-server chassis-id commands restore the default chassis ID string by removing the snmp-server chassis-id command from the configuration.

Command Mode
Global Configuration

Command Syntax

```
snmp-server chassis-id  id_text
no snmp-server chassis-id
default snmp-server chassis-id
```

Parameters

- `id_text` chassis ID string

Example

These commands configure `xyz-1234` as the chassis-id string, then display the result.

```
switch(config)#snmp-server chassis-id xyz-1234
switch(config)#show snmp
Chassis: xyz-1234<---chassis ID
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
21 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
  Logging to taccon.162
SNMP agent enabled
switch(config)#
```
19.5.18 snmp-server community

The `snmp-server community` command configures the community string. SNMP community strings serve as passwords that permit an SNMP manager to access the agent on the switch. The Network Management System (NMS) must define a community string that matches at least one of the switch community strings to access the switch.

The `no snmp-server community` and `default snmp-server community` commands remove the community access string from the configuration.

Command Mode

Global Configuration

Command Syntax

```
snmp-server community string_text [MIB_VIEW][ACCESS][ACL_NAMES]
no snmp-server community string_text
default snmp-server community string_text
```

Parameters

- `string_text` community access string.
- MIB_VIEW community access availability. Options include:
  - `<no parameter>` community string allows access to all objects.
  - `view view_name` community string allows access only to objects in the `view_name` view.
- ACCESS community access availability. Options include:
  - `<no parameter>` read-only access (default setting).
  - `ro` read-only access.
  - `rw` read-write access.
- ACL_NAMES community access availability. Options include:
  - `<no parameter>` community string allows access to all objects.
  - `list_v4` IPv4 ACL list.
  - `ipv6 list_v6` IPv6 ACL list.
  - `ipv6 list_v6 list_v4` IPv4 and IPv6 ACL list.

Example

This command adds the community string `lab_1` to provide read-only access to the switch agent.

```
switch(config)#snmp-server community lab_1 ro
switch(config)#
```
19.5.4.19 snmp-server contact

The `snmp-server contact` command configures the system contact string. The contact is displayed by the `show snmp` and `show snmp v2-mib contact` commands.

The `no snmp-server contact` and `default snmp-server contact` commands remove the `snmp-server contact` command from the `running-config`.

Command Mode
Global Configuration

Command Syntax

```
   snmp-server contact  contact_string
   no snmp-server contact
   default snmp-server contact
```

Parameters
- `contact_string` system contact string.

Example

These commands configure *Bonnie H* as the contact string, then display the result.

```
switch(config)#snmp-server contact Bonnie H
switch(config)#show snmp
Chassis: xyz-1234
Contact: Bonnie H.
8 SNMP packets input
  0 Bad SNMP version errors
  0 Unknown community name
  0 Illegal operation for community name supplied
  0 Encoding errors
  8 Number of requested variables
  0 Number of altered variables
  4 Get-request PDUs
  4 Get-next PDUs
  0 Set-request PDUs
24 SNMP packets output
  0 Too big errors
  0 No such name errors
  0 Bad value errors
  0 General errors
  8 Response PDUs
  0 Trap PDUs
SNMP logging: enabled
   Logging to taccon.162
SNMP agent enabled
switch(config)#
```
The `snmp-server enable traps` command enables both Simple Network Management Protocol (SNMP) traps and SNMP inform requests; use the `snmp-server host` command to specify which will receive SNMP notifications. Sending notifications requires at least one `snmp-server host` command.

The `snmp-server enable traps` and `no snmp-server enable traps` commands, without a MIB parameter, specify the default notification trap generation setting for all MIBs. These commands, when specifying a MIB, control notification generation for the specified MIB. The `default snmp-server enable traps` command resets notification generation to the default setting for the specified MIB.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server enable traps [trap_type]
no snmp-server enable traps [trap_type]
default snmp-server enable traps [trap_type]
```

**Parameters**

- `trap_type` controls the generation of informs or traps for the specified MIB:
  - `<no parameter>` controls notifications for MIBs not covered by specific commands.
  - `entity` controls entity-MIB modification notifications.
  - `lldp` controls LLDP notifications.
  - `msdpBackwardTransition` controls msdpBackwardTransition notifications.
  - `msdpEstablished` controls msdpEstablished notifications.
  - `snmp` controls SNMP-v2 notifications.
  - `switchover` controls switchover notifications.
  - `snmpConfigManEvent` controls snmpConfigManEvent notifications.
  - `test` controls test traps.

**Examples**

- These commands enables notification generation for all MIBs except spanning tree.

  ```
  switch(config)#snmp-server enable traps
  switch(config)#no snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables spanning-tree MIB notification generation, regardless of the default setting.

  ```
  switch(config)#snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command resets the spanning-tree MIB notification generation to follow the default setting.

  ```
  switch(config)#default snmp-server enable traps spanning-tree
  switch(config)#
  ```

- This command enables switchover MIB notification generation, regardless of the default setting.

  ```
  switch(config)#snmp-server enable traps switchover
  switch(config)#
  ```
• This command resets the switchover MIB notification generation to follow the default setting.

```bash
switch(config)# default snmp-server enable traps switchover
switch(config)#
```
19.5.4.21  snmp-server enable traps bridge

The aristaMacMove, aristaMacLearn, and aristaMacAge traps are disabled by default. You can enable them, like all traps, using the `snmp-server enable traps` command. They are grouped under the `bridge` category, so you enable all of them at once using the `snmp-server enable traps bridge` command.

**Command Mode**
Configuration mode

**Command Syntax**

```
snmp-server enable traps bridge [arista-mac-age | arista-mac-learn | arista-mac-move]
no snmp-server enable traps bridge [arista-mac-age | arista-mac-learn | arista-mac-move]
```

**Parameters**

- **arista-mac-age** Enables aristaMacAge trap.
- **arista-mac-learn** Enables aristaMacLearn trap.
- **arista-mac-move** Enables aristaMacMove trap.

**Examples**

In the following example, aristaMacAge traps are enabled, aristaMacLearn traps are disabled, and aristaMacMove traps have their default value, which is disabled.

```
switch(config)#snmp-server enable traps bridge ?
  arista-mac-age   Enable aristaMacAge trap
  arista-mac-learn Enable aristaMacLearn trap
  arista-mac-move  Enable aristaMacMove trap
switch(config)#snmp-server enable traps bridge arista-mac-age
switch(config)#no snmp-server enable traps bridge arista-mac-learn
```
19.5.4.22 snmp-server engineID local

The `snmp-server engineID local` command configures the name for the local Simple Network Management Protocol (SNMP) engine. The default SNMP engineID is generated by the switch and is used when an engineID is not configured with this command. The `show snmp engineID` command displays the default or configured engine ID.

SNMPv3 authenticates users through security digests (MD5 or SHA) that are based on user passwords and the local engine ID. Passwords entered on the CLI are similarly converted, then compared to the user's security digest to authenticate the user.

Note: Changing the local engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID` and `default snmp-server engineID` commands restore the default engineID by removing the `snmp-server engineID` command from the `running-config`.

Command Mode
Global Configuration

Command Syntax

```
snmp-server engineID local engine_hex
no snmp-server engineID local
default snmp-server engineID
```

Parameters

- `engine_hex` the switch name for the local SNMP engine (hex string).

The string must consist of at least ten characters with a maximum of 64 characters.

Example

- This command configures DC945798CAB4 as the name of the local SNMP engine.

```
switch(config)#snmp-server engineID local DC945798CAB4
switch(config)#
```
19.5.4.23  snmp-server engineID remote

The `snmp-server engineID remote` command configures the name of a Simple Network Management Protocol (SNMP) engine located on a remote device. The switch generates a default engineID; use the `show snmp engineID` command to view the configured or default engineID.

An SNMPv3 inform requires a remote engine ID to compute the security digest that authenticates and encrypts data transmitted to remote users. SNMPv3 authenticates users with MD5 or SHA through the engine ID and user passwords. CLI passwords are similarly authenticated.

Note: Changing the engineID value invalidates SNMPv3 security digests, requiring the reconfiguration of all user passwords.

The `no snmp-server engineID remote` and `default snmp-server engineID remote` commands remove the `snmp-server engineID remote` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server engineID remote  engine_addr [PORT] engine_hex
no snmp-server engineID remote  engine_addr [PORT]
default snmp-server engineID remote  engine_addr [PORT]
```

**Parameters**
- `engine_addr` location of remote engine (IP address or host name).
- PORT udp port location of the remote engine. Options include:
  - `<No parameter>` port number 161 (default).
  - `udp-port port_num` port number. Ranges from 0 to 65535.
- `engine_hex` the switch’s name for the remote SNMP engine (hex string).
  The string must have at least ten characters and can contain a maximum of 64 characters.

**Example**

This command configures DC945798CA as the engineID of the remote SNMP engine located at 10.23.10.25, UDP port 162.

```bash
switch(config)# snmp-server engineID remote 10.23.10.25 udp-port 162 DC945798CA
switch(config)#
```
19.5.4.24  snmp-server extension

The snmp-server extension command configures the execution of user supplied scripts to service portions of the OID space.

The no snmp-server extension and default snmp-server extension commands deletes the snmp-server extension command from the running-config.

Command Mode
Global Configuration

Command Syntax

snmp-server extension OID_space FILE_PATH [DURATION]

Parameters

• OID_space OID branch serviced by the script, in numerical format.
• FILE_PATH path and name of the script file. Options include:
  • file: file is located in the switch file directory.
  • flash: file is located in flash memory.
• DURATION the execution scope of the script.
  • <no parameter> script runs after initial request to process subsequent requests.
  • one-shot script processes a single object (runs once), then terminates.

Examples

This command specifies the file example.sh, located in flash, as the script file that services the listed OID space.

switch(config)#snmp-server extension .1.3.6.1.4.1.8072.2 flash:example.sh
The `snmp-server group` command configures a new Simple Network Management Protocol (SNMP) group or modifies an existing group. An SNMP group is a data structure that user statements reference to map SNMP users to SNMP contexts and views, providing a common access policy to the specified users.

An SNMP context is a collection of management information items accessible by an SNMP entity. Each item may exist in multiple contexts. Each SNMP entity can access multiple contexts. A context is identified by the EngineID of the hosting device and a context name.

The `no snmp-server group` and `default snmp-server group` commands delete the specified group by removing the corresponding `snmp-server group` command from the configuration.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
snmp-server group  group_name  VERSION [CNTX][READ][WRITE][NOTIFY]
no snmp-server group  group_name  VERSION
default snmp-server group  group_name  VERSION
```

**Parameters**

- `group_name` the name of the group.
- `VERSION` the security model utilized by the group.
  - v1 SNMPv1. Uses a community string match for authentication.
  - v2c SNMPv2c. Uses a community string match for authentication.
  - v3 no auth SNMPv3. Uses a username match for authentication.
  - v3 auth SNMPv3. HMAC-MD5 or HMAC-SHA authentication.
  - v3 priv SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
- `CNTX` associates the SNMP group to an SNMP context.
  - `<no parameter>` command does not associate group with an SNMP context.
  - `context context_name` associates group with context specified by `context_name`.
- `READ` specifies read view for SNMP group.
  - `<no parameter>` command does not specify read view.
  - `read read_name` read view specified by `read_name` (string maximum 64 characters).
- `WRITE` specifies write view for SNMP group.
  - `<no parameter>` command does not specify write view.
  - `write write_name` write view specified by `write_name` (string maximum 64 characters).
- `NOTIFY` specifies notify view for SNMP group.
  - `<no parameter>` command does not specify notify view.
  - `notify notify_name` notify view specified by `notify_name` (string maximum 64 characters).

**Example**

This command configures normal_one as SNMP version 3 group (authentication and encryption) that provides access to the all-items read view.

```plaintext
switch(config)#snmp-server group normal_one v3 priv read all-items
switch(config)#
```
The `snmp-server host` command configures an SNMP host (to which SNMP traps will be sent) and sets the community string if it was not previously configured. The host is denoted by host location and community string. The command also specifies the type of SNMP notifications that are sent: a trap is an unsolicited notification; an inform is a trap that includes a request for a confirmation that the message is received.

The configuration can contain multiple statements to the same host location with different community strings. For instance, a configuration can simultaneously contain all of the following:

- `snmp-server host host-1 version 2c comm-1`
- `snmp-server host host-1 informs version 2c comm-2`
- `snmp-server host host-1 version 2c comm-3 udp-port 666`
- `snmp-server host host-1 version 3 auth comm-3`

The `no snmp-server host` and `default snmp-server host` commands remove the specified host by deleting the corresponding `snmp-server host` statement from the configuration. When removing a statement, the host (address and port) and community string must be specified.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server host host_id [VRF_INST][MESSAGE][VERSION] comm_str [PORT]
no snmp-server host host_id [VRF_INST][MESSAGE][VERSION] comm_str [PORT]
default snmp-server host host_id [VRF_INST][MESSAGE][VERSION] comm_str [PORT]
```

**Parameters**

- `host_id` hostname or IP address of the SNMP host.
- `VRF_INST` specifies the VRF instance being modified.
  - `<no parameter>` changes are made to the default VRF.
  - `vrf vrf_name` changes are made to the specified user-defined VRF.
- `MESSAGE` message type that is sent to the host.
  - `<no parameter>` sends SNMP traps to host (default).
  - `informs` sends SNMP informs to host.
  - `traps` sends SNMP traps to host.
- `VERSION` SNMP version. Options include:
  - `<no parameter>` SNMPv2c (default).
  - `version 1` SNMPv1; option not available with informs.
  - `version 2c` SNMPv2c.
  - `version 3 noauth` SNMPv3; enables user-name match authentication.
  - `version 3 auth` SNMPv3; enables MD5 and SHA packet authentication.
  - `version 3 priv` SNMPv3. HMAC-MD5 or HMAC-SHA authentication. AES or DES encryption.
  - `comm_str` community string to be sent with the notification as a password.

Arista recommends setting this string separately before issuing the `snmp-server host` command. To set the community string separately, use the `snmp-server community` command.

- `PORT` port number of the host.
  - `<no parameter>` socket number set to 162 (default)
  - `udp-port p-name` socket number specified by `p-name`.

**Guidelines**
The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the **default** VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

This command adds a version 2c inform notification recipient.

```
switch(config)#snmp-server host 10.15.2.3 informs version 2c comm-1
switch(config)#
```
19.5.4.27  snmp-server local-interface

The `snmp-server local-interface` command specifies the interface where SNMP originates informs and traps.

The `no snmp-server local-interface` and `default snmp-server local-interface` commands remove the inform or trap source assignment by removing the `snmp-server local-interface` command from `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server local-interface INTERFACE
no snmp-server local-interface
default snmp-server local-interface
```

**Parameters**

- INTERFACE Interface type and number. Values include:
  - ethernet `e_num` Ethernet interface specified by `e_num`.
  - loopback `l_num` Loopback interface specified by `l_num`.
  - management `m_num` Management interface specified by `m_num`.
  - port-channel `p_num` Port-Channel Interface specified by `p_num`
  - vlan `v_num` VLAN interface specified by `v_num`.
  - vrf `vrf_name` The VRF in which SNMP is enabled. The keyword default specifies the default VRF.

**Example**

This command configures the Ethernet 1 interface as the source of SNMP traps and informs.

```
switch(config)#snmp-server local-interface ethernet 1
```

```
switch(config)#
```
19.5.4.28  **snmp-server location**

The `snmp-server location` command configures the system location string. By default, no system location string is set.

The `no snmp-server location` and `default snmp-server location` commands delete the location string by removing the `snmp-server location` command from the configuration.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server location  node_locate
no snmp-server location
default snmp-server location
```

**Parameters**

- `node_locate` system location information (string).

**Example**

These commands configure `lab-east` as the location string.

```
switch(config)#snmp-server location lab_east
switch(config)#
```
19.5.4.29  snmp-server qosmib counter-interval

The `snmp-server qosmib counter-interval` command configures the interval (in seconds) after which the QoS counters are updated periodically. By default the counter updates are disabled.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server qosmib counter-interval timer_interval
do not snmp-server qosmib counter-interval
default snmp-server qosmib counter-interval
```

**Parameter**

- `timer_interval` Update interval for refreshing QoS counters (in seconds) between (10-600).

**Example**

- The following command configures an interval of 50 seconds after which the QoS counters are updated periodically.

  ```
  switch(config)#snmp-server qosmib counter-interval 50
  ```
19.5.4.30  snmp-server user

The `snmp-server user` command adds a user to a Simple Network Management Protocol (SNMP) group or modifies an existing user's parameters.

To configure a user, the IP address or port number of the device where the user's remote SNMP agent resides must be specified. A user's authentication come from the engine ID and the user's password. Remote user configuration commands fail if the remote engine ID is not configured first.

The `no snmp-server user` and `default snmp-server user` commands remove the user from an SNMP group by removing the user command from `running-config`.

![Image](image.png)

**Note:** Use the following minimums when using the stronger SNMPv3 encryption algorithm to avoid any interoperability issues.

- When using AES-192 for encryption/privacy, use a minimum of SHA-224 for authentication.
- When using AES-256 for encryption/privacy, use a minimum of SHA-256 for authentication.

**Command Mode**
Global Configuration

**Command Syntax**

```
snmp-server user  user_name  group_name [AGENT] VERSION [ENGINE][SECURITY]
no snmp-server user  user_name  group_name [AGENT] VERSION
default snmp-server user  user_name  group_name [AGENT] VERSION
```

**Parameters**

- `user_name` name of user.
- `group_name` name of group to which user is being added.
- **AGENT** Options include:
  - `<no parameter>` local SNMP agent.
  - `remote addr [udp-port p_num]` remote SNMP agent location.

  `addr` denotes the IP address; `p_num` denotes the udp port socket (default port is 162).

- **VERSION** SNMP version; options include:
  - v1 SNMPv1.
  - v2c SNMPv2c.
  - v3 SNMPv3.

- **ENGINE** engine ID used to localize passwords. Available only if VERSION is v3.
  - `<no parameter>` Passwords localized by SNMP copy specified by `agent`.
  - localized `engineID` octet string of engineID.

- **SECURITY** Specifies authentication and encryption levels. Available only if VERSION is v3. Encryption is available only when authentication is configured.
  - `<no parameter>` no authentication or encryption.
  - `auth a_meth a_pass [priv e_meth e_pass]` authentication parameters.
  - `a_meth` authentication method: options are md5 (HMAC-MD5-96) and sha (HMAC-SHA-96).
  - `a-pass` authentication string for users receiving packets.
  - `e_meth` encryption method: Options are aes (AES-128) and des (CBC-DES).
  - `e-pass` encryption string for the users sending packets.

**Example**

```bash
3415
```
This command configures the remote SNMP user *tech-1* to the *tech-sup* SNMP group.

```
switch(config)#snmp-server user tech-1 tech-sup remote 10.1.1.2 v3
```
The `snmp-server view` command defines a view.

An SNMP view defines a subset of objects from an MIB. Every SNMP access group specifies views, each associated with read or write access rights, to allow or limit the group's access to MIB objects.

The `no snmp-server view` command deletes a view entry by removing the corresponding `snmp-server view` command from the *running-config*.

**Command Mode**

Global Configuration

**Command Syntax**

```
snmp-server view  view_name family_name INCLUSION
no snmp-server view  view_name [family_name]
default snmp-server view  view_name [family_name]
```

**Parameters**

- `view_name` Label for the view record that the command updates. Other commands reference the view with this label.
- `family_name` name of the MIB object or family.

MIB objects and MIB subtrees can be identified by name or by the numbers representing the position of the object or subtree in the MIB hierarchy.

- `INCLUSION` inclusion level of the specified family within the view. Options include:
  - `include` view includes the specified subtree.
  - `exclude` view excludes the specified subtree.

**Example**

- These commands create a view named sys-view that includes all objects in the system subtree except for those in `system.2`.

```
switch(config)#snmp-server view sys-view system include
switch(config)#snmp-server view sys-view system.2 exclude
```
The `snmp-server vrf` command enables SNMP in the specified VRF. By default, SNMP is enabled only in the default VRF.

- User-defined VRFs: The `no snmp-server vrf` command disables SNMP in the specified VRF by removing the corresponding `snmp-server vrf` command from the `running-config`.
- Default VRF: The `no snmp-server vrf` command disables SNMP in the VRF by adding a `no snmp-server vrf default` statement to `running-config`.

**Command Mode**

Global Configuration

**Command Syntax**

```plaintext
snmp-server vrf vrf_name
no snmp-server vrf vrf_name
default snmp-server vrf vrf_name
```

**Parameters**

- `vrf_name` The VRF in which SNMP is enabled. The keyword `default` specifies the default VRF.

**Guidelines**

The switch can only send SNMP traps and informs if the host that has been configured to receive them is accessible through an interface in a VRF in which SNMP has been enabled. SNMP is enabled by default only in the default VRF. Enable or disable SNMP in a VRF with the `snmp-server vrf` command.

**Example**

These commands disable SNMP in the default VRF, then enable it in the user-defined VRFs named `magenta` and `columbia`.

```plaintext
switch(config)#no snmp-server vrf default
switch(config)#snmp-server vrf magenta
switch(config)#snmp-server vrf columbia
switch(config)#
```

## 19.6 VM Tracer

This chapter describes VM Tracer configuration and usage and contains these sections:

- VM Tracer Introduction
- VM Tracer Description
- VM Tracer Configuration Procedures
- VM Tracer Commands

### 19.6.1 VM Tracer Introduction

VM Tracer is a switch feature that determines the network configuration and requirements of connected VMware hypervisors. The switch uses VMware's SOAP XML API to discover VMware host server components, including:

- instantiated VMs with their network configuration (VLANs and distributed/virtual Switches).
- server hardware IPMI data which can be shown to the network manager.
VM Tracer also supports adaptive auto-segmentation, which automatically provisions and prunes VLANs from server-switched ports as VMs are instantiated and moved within the data center.

### 19.6.2 VM Tracer Description

Cloud operating systems manage large virtualized computing infrastructures, including software and hardware. Cloud operating systems consist of virtual machines and hypervisors:

- A virtual machine (VM) is a software implementation of a computer that operates as running on dedicated physical hardware. Multiple VMs share physical machine resources from a single physical device. Each VM is controlled by its operating system.
- A hypervisor, also called a virtual Machine Manager (VMM), is software that manages multiple operating systems running concurrently on a physical device.

VM Tracer tracks activity of VMs that are controlled by hypervisors connected to the switch’s Ethernet or LAG ports. VM Tracer supports vSphere versions 6.0–7.0. The vSphere features include distributed virtual switches (DVS) and VM movement among VMware servers (VMotion).

vSphere components include:

- ESX and ESXi: hypervisors that run on VMware host server hardware.
- vCenter: centralized tool that manages multiple servers running VMware hypervisors.
- NSX for vSphere® (NSX-V): network virtualization platform delivering networking and security.

Monitoring VLAN based configurations requires vCenter access. Monitoring VXLAN based configurations requires access to vCenter and NSX-V. The following sections describe topologies that monitor these networks:

- Monitoring VLAN Based Configurations
- Monitoring VXLAN Based Configurations

#### 19.6.2.1 Monitoring VLAN Based Configurations

vCenter manages ESX hosts and VMs through a central database. VM Tracer identifies interfaces connected to a specified ESX host and sends discovery packets (CDP or LLDP) on interfaces where VM Tracer is enabled. The ESX host updates the vCenter when it receives a discovery packet. VM Tracer reads this data from the vCenter through a SOAP XML API to associate the ESX host to the connected switch ports. The network topology of this configuration is displayed below.

![Figure 140: VM Tracer Topology – Monitoring VLAN Based Configurations](image)

VM Tracer connects to a maximum of four vCenters through a SOAP (Simple Object Access Protocol) API to discover VMs in the data centers that the vCenters manage. VM Tracer maintains a list of VMs in the data center and gathers network related information about each VM, including the number of Vnics (virtual network interface card), the MAC address of each Vnic, the switch to which it connects,
and the host on which it resides. VM Tracer also identifies the host NICs connected to the switch through the bridge MAC address and the interface port name. VM Tracer then searches for VMs on this host and connected to the vswitch or dvswitch whose uplink is mapped to the connected NIC.

For each connected interface, VM Tracer creates a VM Table that lists its active VMs, sorted by Vnic MAC address. Each VM entry includes its name, Vnic name, VLAN, switch name, datacenter name, and portgroup. An entry is deleted when the corresponding VM is removed, moved to a different host, or its Vnic is no longer part of the vswitch or dvswitch. An entry is added when a VM is created or moved to a host connected to the interface. VM Tracer monitors vCenter for VM management updates. If an interface goes down, all VM entries for that interface are removed from the VM Table.

19.6.2.2 Monitoring VXLAN Based Configurations

Monitoring VXLAN based configurations require access to the NSX for vSphere® (NSX-V), in addition to the configuration described in Monitoring VLAN Based Configurations. Each VM Tracer session can communicate with one NSX-V through a REST interface over XML and gathers VXLAN information by polling it on a 30 second polling cycle. VXLAN data that the switch receives from the NSX-V includes:

- VNI range.
- VXLAN segment.
- Multicast address range.
- network scope.

The network scope specifies the virtual address space the VXLAN segments span and is defined by the server group (cluster) collections within the segments, which in turn contain a collection of distributed virtual switches (DVS) from ESX hosts within the clusters.

VM Tracer uses this information to build a network model. Communications with NSX-V requires a single polling thread that detects network connectivity and constantly updates the local data model. The network topology of this configuration is displayed below.

![VM Tracer Topology – Monitoring VXLAN Based Configurations](image)

19.6.3 VM Tracer Configuration Procedures

The following sections describe the session configuration process, configuring the NSX-V connection for VXLAN based configurations, and the procedure for enabling VM Tracer on individual interfaces. The switch defines vmtracer configuration mode and VMtracer mode:

- vmtracer configuration mode is a command mode for configuring VM Tracer monitoring sessions.
- VMtracer mode is defines an interface state where discovery packets are sent to attached vSwitches.
19.6.3.1 Configuring vCenter Monitoring Sessions

A VM Tracer session connects the switch to a vCenter server for downloading data about VMs and vSwitches managed by ESX hosts connected to the switch’s ports. The switch supports four VM Tracer sessions.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The vmtracer session command places the switch in vmtracer configuration mode for a specified session. The command either creates a new session or loads an existing session for editing.

- This command enters vmtracer configuration mode for the system_1 session.

```bash
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

In vmtracer configuration mode, the url (vmtracer mode), username (vmtracer mode), and password (vmtracer mode) commands specify the location and the account information that authenticates the switch. The URL parameter must reference a fully formed secure URL.

- These commands specify the IANA url along with the username and password that allow the switch to access the location.

```bash
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```

Default session settings allow auto-segmentation, or the dynamic allocation and pruning of VLANs when a VM managed by the ESX host connected to the switch is created, deleted, or moved to a different host. The autovlan disable command prevents auto-segmentation, regardless of VM activity. The allowed-vlan command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

- This command disables auto-segmentation.

```bash
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```

- These commands enable auto-segmentation and limit the list of allowed VLANs to VLAN 1-2000.

```bash
switch(vmtracer-system_1)#no autovlan disable
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

The exit command returns the switch to Global configuration mode and enables the VM Tracer session. Vmtracer configuration mode can be re-entered for this session to edit session parameters.

- This command exits vmtracer configuration mode.

```bash
switch(vmtracer-system_1)#exit
switch(config)#
```

The no vmtracer session command disables the session and removes it from running-config.

- This command disables and deletes the system_1 VM Tracer session.

```bash
switch(config)#no vmtracer session system_1
switch(config)#
```
19.6.3.2 Configuring vShield Monitoring Sessions

To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session.

The switch is placed in vmtracer configuration mode to edit session parameters, including the vCenter location and dynamic VLAN usage. Changes take effect by exiting vmtracer mode.

The \texttt{vxlan} (vmtracer mode) command is executed from vmtracer mode for a specified session and places the switch in vmtracer-vxlan configuration mode for that session. Each VM Tracer session can be associated with one vShield instance.

- These commands create the vShield instance for the VMTracer session named vnet-1.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

In vmtracer-vxlan configuration mode, the \texttt{url} (vmtracer-vxlan mode), \texttt{username} (vmtracer-vxlan mode), and \texttt{password} (vmtracer-vxlan mode) commands specify the vShield server's location and the account information that authenticates the switch to the vShield server. The \texttt{url} parameter must reference a fully formed secure url, such as \texttt{https://vcsshield.democorp.com/sdk}.

- These commands specify the vShield's URL along with the username and password that allow the switch to access the vShield server.

```
switch(config-vmtracer-vnet-1-vxlan)#url https://vshieldserver.comp any1.org/sdk
switch(config-vmtracer-vnet-1-vxlan)#username a-shield_01
switch(config-vmtracer-vnet-1-vxlan)#password home
switch(config-vmtracer-vnet-1-vxlan)#
```

19.6.3.3 Enabling VMtracer Mode

VMtracer mode is an interface setting that enables interfaces to send discovery packets to the connected vSwitch. The \texttt{vmtracer} command enables VMtracer mode on the configuration mode interface.

- These commands enable VMtracer mode on the Ethernet 3 interface.

```
switch(config)#interface Ethernet3
switch(config-if-Et3)#vmtracer vmware-esx
switch(config-if-Et3)#
```

The \texttt{no} \texttt{vmtracer} command disables vmtracer mode on the configuration mode interface.

- This command disables vmtracer mode on the Ethernet 3 interface.

```
switch(config-if-Et3)#no vmtracer vmware-esx
switch(config-if-Et3)#
```

19.6.3.4 Displaying VM Tracer Data

19.6.3.4.1 Displaying Session Status

The \texttt{show vmtracer session} command displays information about the specified session.
Without the detail parameter, the command displays connection parameters and status for the vCenter associated to the specified session.

- This command displays connection parameters for the vCenter associated with the system_1 session.

```
switch#show vmtracer session system_1
vCenter URL https://vmware-vcenter1/sdk
username arista
password arista
Session Status Disconnected
```

With the detail parameter, the command displays connection status and data concerning messages the vCenter previously received from ESX hosts connected to the switch.

- This command displays connection parameters and message details for the vCenter associated with the system_1 session.

```
switch#show vmtracer session system_1 detail
vCenter URL https://vmware-vcenter1/sdk
username arista
sessionState Connected
lastStateChange 19 days, 23:03:59 ago

### 19.6.3.4.2 Displaying VM Interfaces

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on switch interfaces where vmtracer mode is enabled. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

This command displays the Vnics connected to all VM Tracer-enabled interfaces.

```
switch#show vmtracer interface
Ethernet8 : example.com
    VM Name VM Adapter VLAN Status
    esx3.aristanetworks.com vmk0 0 Up/Down
    vspheremanagement Network adapter 1 0 Up/Down

Ethernet15 : example.com
    VM Name VM Adapter VLAN Status
    Openview Network adapter 1 123 Up/Down
    VmTracerVm Network adapter 1 123 Down/Down

Ethernet23 : example.com
    VM Name VM Adapter VLAN Status
```
19.6.3.4.3 Displaying VMs

The `show vmtracer vm` command displays VM interfaces (Vnics) accessible to the VM Tracer-enabled interfaces. For each active listed VM, the command displays its name, adapter, and the connected hypervisor.

- This command displays the VMs connected to all VM Tracer-enabled interfaces.

```bash
switch#show vmtracer vm
VM Name VM Adapter Interface VLAN
Openview Network adapter 1 Et15 123
vSphereManagement Network adapter 1 Et8 0
VmTracerVm Network adapter 1 Et15 123
example.com vmk0 Et8 0
```

- This command displays connection data for the VMs connected to all VM Tracer-enabled interfaces.

```bash
switch#show vmtracer vm detail
VM Name Openview
  intf : Et15
  vnic : Network adapter 1
  mac : 00:0c:29:ae:7e:90
  portgroup : dvPortGroup
  vlan : 123
  switch : vds
  host : example.com
```
19.6.4 VM Tracer Commands

Global Configuration Commands
- vmtracer session

Interface Configuration (Ethernet and Port Channel) Commands
- vmtracer

VMTracer Configuration Commands
- allowed-vlan
- autovlan disable
- password (vmtracer mode)
- source-interface
- url (vmtracer mode)
- username (vmtracer mode)
- vrf (vmtracer mode)
- vxlan (vmtracer mode)

VMTracer-VXLAN Configuration Commands
- password (vmtracer-vxlan mode)
- url (vmtracer-vxlan mode)
- username (vmtracer-vxlan mode)

VM Tracer Display Commands
- show vmtracer all
- show vmtracer interface
- show vmtracer session
- show vmtracer session vcenter
- show vmtracer session vsm
- show vmtracer vm
- show vmtracer vm detail
- show vmtracer vnic counters
- show vmtracer vxlan segment
- show vmtracer vxlan vm
19.6.4.1  allowed-vlan

The allowed-vlan command specifies the VLANs that may be added when a VM is added or moved from the hypervisor connected to the session specified by the vmtracer mode. By default, all VLANs are allowed.

Command Mode
Vmtracer Configuration

Command Syntax

allowed-vlan [VLAN_LIST]

no allowed-vlan

default allowed-vlan vlan

Parameters

- **VLAN_LIST** The VLAN list or the edit actions to the current VLAN list. Valid v_range formats include number, or number range.
  - **v_range** The list consists of the v_range VLANs.
  - **add v_range** The v_range VLANs are added to the current VLAN list.
  - **all** The list consists of all VLANs (1-4094).
  - **except v_range** The list consists of all VLANs except for those specified by v_range.
  - **none** The list of VLANs is empty.
  - **remove v_range** The v_range VLANs are removed from the current VLAN list.

Related Commands

- **vmtracer session** places the switch in vmtracer configuration mode.

Examples

- This command sets the list of allowed VLANs to 1 through 2000.

```
switch(vmtracer-system_1)#allow-vlan 1-2000
switch(vmtracer-system_1)#
```

- This command adds VLANs to 2501 through 3000.

```
switch(vmtracer-system_1)#allow-vlan add 2051-3000
switch(vmtracer-system_1)#
```
19.6.4.2  autovlan disable

Default VM Tracer session settings enable auto provisioning, which allows the dynamic assignment and pruning of VLANs when a VM attached to the ESX connected to the switch is created, deleted, or moved to a different ESX host. The autovlan setting controls auto provisioning.

The `autovlan disable` command disables auto provisioning, which prevents the creation or deletion of VLANs regardless of VM activity. The `allowed-vlan` command specifies the VLANs that may be added when a VM is added or moved. By default, all VLANs are allowed.

The `no autovlan disable` command enables the creation and deletion of VLANs caused by VM activity. This is the default setting.

**Command Mode**
Vmtracer Configuration

**Command Syntax**

`autovlan disable`
`no autovlan disable`
`default autovlan disable`

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command disables dynamic VLAN creation or pruning within the configuration mode VM Tracer session.

```
switch(vmtracer-system_1)#autovlan disable
switch(vmtracer-system_1)#
```
19.6.4.3  password (vmtracer mode)

The `password` command specifies the token that authorizes the username to the vCenter associated with the VM Tracer mode session.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

`password  [ENCRYPTION] [password]`

**Parameters**

- **ENCRYPTION** encryption level of the password.
  - `<no parameter>`  `password` is a clear-text string.
  - `0` the `password` is a clear-text string. Equivalent to `<no parameter>`.
  - `7` the `password` is an encrypted string.
- `password` text that authenticates the username.
  - `password` is a clear-text string if ENCRYPTION specifies clear text.
  - `password` is an encrypted string if ENCRYPTION specifies an encrypted string.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command configures abode as the clear-text string that authorizes the username a-switch_01 located at example.com/sdk.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#password abcde
switch(vmtracer-system_1)#
```
19.6.4.4   password (vmtracer-vxlan mode)

The password command specifies the token that authorizes the username on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this account to access NSX-V information.

The password statement is replaced in running-config for the configuration mode interface by a subsequent password command. The statement is removed by deleting the NSX-V instance through a no vxlan (vmtracer mode) command in vmtracer configuration mode.

Command Mode
Vmtracer-vxlan Configuration

Command Syntax
password [ENCRIPTION] password

Parameters
• ENCRYPTION   encryption level of the password.
  • <no parameter>   password is a clear-text string.
  • 0    the password is a clear-text string. Equivalent to <no parameter>.
  • 7    the password is an encrypted string.
• password    text that authorizes the username.
  • password is a clear-text string if ENCRYPTION specifies clear text.
  • password is an encrypted string if ENCRYPTION specifies an encrypted string.

Related Commands
• vxlan (vmtracer mode) places the switch in vmtracer-vxlan configuration mode.

Example
• This command configures 5678 as the clear-text string that authorizes the username admin to the NSX-V located at https://example.com/sdk.

```bash
switch(config)#vmtracer session vnet-1
switch(config-vnet-1)#vxlan
switch(config-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vnet-1-vxlan)#username admin
switch(config-vnet-1-vxlan)#password 5678
switch(config-vnet-1-vxlan)#exit
vmtracer session vnet-1
    allowed-vlan 1-4094
    vxlan
        url https://example.com/sdk
        username admin
        password 7 s2Xg4GSBLYU=
switch(config-vnet-1-vxlan)#
```
19.6.4.5  show vmtracer all

The `show vmtracer all` command displays VM Tracer data for all switches with the vSphere scope.

**Command Mode**
EXEC

**Command Syntax**
`show vmtracer all`

**Example**
- This command displays data for both switches in the vSphere scope.

```markdown
switch>show vmtracer all
Switch : a109(10.10.30.109)
Ethernet49 : 10.102.28.3/10G
  VM Name   VM Adapter          VLAN      Status    State
  ABCD      Network adapter 2   native    Up/--     --
Switch : a164(10.10.30.172.22.30.164)
Ethernet49 : 10.102.28.3/10G Storage Network/dvUplink1
  VM Name   VM Adapter          VLAN      Status    State
  WXYZ      Network adapter 2   native    Up/--     --
switch>
```
### show vmtracer interface

The `show vmtracer interface` command displays the VM interfaces (Vnics) that are active on the VM Tracer enabled interface. For each Vnic, the command displays the name of the attached VM, the adapter name, its VLAN, the VM power state, and the presence status of its MAC address in the switch's MAC table.

**Command Mode**

EXEC

**Command Syntax**

`show vmtracer interface [INT_NAME][INFO_LEVEL]`

**Parameters**

- **INT_NAME** the interfaces to be configured. Values include:
  - `<no parameter>` command returns information for all interfaces.
  - `ethernet e_range` Ethernet interface range.
  - `port-channel p_range` Port Channel interface range.

  Valid `e_range` and `p_range` formats include number, number range, or comma-delimited list of numbers and ranges.

- **INFO_LEVEL** specifies information that the command returns.
  - `<no parameter>` connection parameters and status for VM associated to specified sessions.
  - `detail` connection status and data concerning messages the VM.
  - `host` name of the connected host.

**Examples**

- This command displays the Vnics connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer interface

Ethernet8 : example.com
  VM Name         VM Adapter          VLAN   Status
  esx3.aristanetworks.com vmk0    0       Up/Down
  vspheremanagement Network adapter 1 0       Up/Down

Ethernet15 : example.com
  VM Name         VM Adapter          VLAN   Status
  Openview        Network adapter 1 123    Up/Down
  VmTracerVm      Network adapter 1 123    Down/Down

Ethernet23 : example.com
  VM Name         VM Adapter          VLAN   Status
  example.com     Network adapter 1 0     Up/Down
  vspheremanagement Network adapter 1 0     Up/Down

```

- This command displays the Vnics connected to the Ethernet 8 interface.

```
switch>show vmtracer interface Ethernet8

Ethernet8 : example.com
  VM Name         VM Adapter          VLAN   Status
  example.com     vmk0    0       Up/Down
  vspheremanagement Network adapter 1 0     Up/Down

```

19.6.4.7 show vmtracer session vcenter

The `show vmtracer session vcenter` command displays vCenter information for a specified VM Tracer session.

**Command Mode**
EXEC

**Command Syntax**
```
show vmtracer session  session_name  vcenter  [INFO_LEVEL]
```

**Parameters**
- `session_name`  VM Tracer sessions for which the command returns information.
- `INFO_LEVEL` specifies information that the command returns.
  - `<no parameter>` displays connection and status information for the specified vCenter.
  - `detail` displays connection, status, and history information for the specified vCenter.

**Examples**
- This command displays connection parameters for the vCenter associated to the abcde session.

```
switch> show vmtracer session abcde vcenter
Session abcde
vCenter URL https://vmware-vcenter5.1/sdk
username Administrator
autovlan enabled
allowed-vlans 1-4094
sessionState Connected
switch>
```

- This command displays connection parameters and history details from the vCenter associated to the abcde session.

```
switch> show vmtracer session abcde vcenter detail
Session abcde
vCenter URL https://vmware-vcenter5.1/sdk
username Administrator
autovlan enabled
allowed-vlans 1-4094
sessionState Connected
lastStateChange 2:46:50 ago

lastFailedMsgTime never
lastErrorCode --
switch>
```
19.6.4.8  show vmtracer session vsm

The `show vmtracer session vsm` command displays NSX-V information for a specified VM Tracer session.

Command Mode
EXEC

Command Syntax
`show vmtracer session session_name vsm [INFO_LEVEL]`

Parameters
- `session_name`  VM Tracer sessions for which the command returns information.
- `INFO_LEVEL` specifies information that the command returns.
  - `<no parameter>`  connection and status information for the specified NSX-V.
  - `detail` connection, status, and history information for the specified NSX-V.

Examples
- This command displays connection parameters for the NSX-V associated to the abcde session.

  ```
  switch> show vmtracer session abcde vsm
  Session abcde
  VShield URL https://example.com/sdk
  username admin
  sessionState Connected
  switch>
  ```

- This command displays connection parameters and history details from the vShield Manager associated to the abcde session.

  ```
  switch> show vmtracer session abcde vsm detail
  Session abcde
  VShield URL https://vmware-vshield5.1/
  username admin
  SessionState Connected

  lastErrorCode CURLE_COULDNT_RESOLVE_HOST - Couldn't resolve host
  switch>
  ```
19.6.4.9  show vmtracer session

The `show vmtracer session` command displays vCenter and vShield connection information for a specified VM Tracer session.

**Command Mode**
EXEC

**Command Syntax**

```
show vmtracer session [SESSION_LIST]
```

**Parameters**

- **SESSION_LIST**  VM Tracer sessions for which the command returns information.
- `<no parameter>`  all configured VM Tracer sessions.
- `session_name`  name of one VM Tracer session.

**Examples**

- This command displays connection parameters associated to the abcde session.

```
switch> show vmtracer session abcde
Session abcde
vCenter URL       https://example.com/sdk
username                        Administrator
autovlan                        enabled
allowed-vlans     1-4094
sessionState      Connected
VShield URL       https://vmware-vshield5.1.xyz.abcde.com
username                    admin
sessionState      Connected
switch>
```
19.6.4.10 show vmtracer vm detail

The `show vmtracer vm detail` command displays connection data for VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces.

Command Mode

EXEC

Command Syntax

`show vmtracer vm [VM_LIST] detail`

Parameters

- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

Examples

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch#show vmtracer vm vcenter1
VM Name  vCenter1 Server App
  Interface :  Po45
  vNIC      :  Network adapter 1
  MAC       :  00:31:22:8e:b8:41
  Portgroup :  VM Network
  VLAN      :  native
  Switch    :  Switch2
  Status    :  Down/Down
  Host      :  10.22.18.28
  Data Center :  vcenter-5
```

- This command displays connection data for the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm detail
VM Name  vCenter1 Server App
  Interface :  Po45
  vNIC      :  Network adapter 1
  MAC       :  00:31:22:8e:b8:41
  Portgroup :  VM Network
  VLAN      :  native
  Switch    :  Switch2
  Status    :  Down/Down
  Host      :  10.22.18.28
  Data Center :  vcenter-5

VM Name  vCenter2 Server App
  Interface :  Po45
  vNIC      :  vmk0
  MAC       :  00:33:23:3c:e1:4e
  Portgroup :  Management Network
  VLAN      :  native
```

switch>
show vmtracer vm

The `show vmtracer vm` command displays VMs interfaces (Vnics) that are accessible to VM Tracer enabled interfaces. For each active VM, the command displays the name of the VM, its adapter, and the hypervisor to which it connects.

**Command Mode**
EXEC

**Command Syntax**

```
show vmtracer [INT_NAME] vm [VM_LIST]
```

**Parameters**
- **INT_NAME** the interfaces name Values include:
  - `<no parameter>` command returns information for all interfaces.
  - `interface ethernet e_range` Ethernet interface range.
  - `interface port-channel p_range` Port Channel interface range.

Valid `e_range` and `p_range` formats include a number, number range, or comma-delimited list of numbers and ranges.
- **VM_LIST** The virtual machines for which the command displays information. Options include:
  - `<no parameter>` command returns information for all present VMs.
  - `vm_name` command returns information only for specified VM.

**Related Commands**
- `show vmtracer vm detail` displays connection information for one or more specified VMs.

**Examples**
- This command displays the VMs connected to all VM Tracer enabled interfaces.

```
switch>show vmtracer vm
VM Name        Esx Host    Interface  VLAN     Status
vCenter1       172.22.28.8 Po45       native   Down/Down
vCenter2       172.22.28.8 Po45       native   Up/Up
vCenter3       172.22.28.8 Po45       11        Down/Down
vCenter4       172.22.28.8 Po45       native   Down/Down
VMKernel       172.22.28.8 Po43       native   Up/Up
demo vcenter 5 clone Po43       native   Up/Up
switch>
```
19.6.4.12  show vmtracer vnic counters

The show vmtracer interface vnic counters command displays input and output packet counts for VM interfaces (Vnics) that are active on the specified interface or VM.

Command Mode
EXEC

Command Syntax
show vmtracer [ENTITY] vnic counters

Parameters
- ENTITY the virtual machine or interface over which statistics are gathered and displayed.
  - <no parameter> command returns information for all active VMs.
  - interface ethernet e_range Ethernet interface range.
  - interface port-channel p_range Port Channel interface range.
  - vm vm_name command returns information for specified VM.

Valid e_range and p_range formats include a number, number range, or comma-delimited list of numbers and ranges.

Examples
- This command displays the Vnics connected to Ethernet interface 24.

```
switch>show vmtracer interface ethernet 24 vnic counters
Physical Intf: Ethernet24
Host: 10.17.28.8/site1/dvUplink1
 VM Name       vNic                  Input Pkt/Byte/%         Output Pkt/Byte/%
  vCenter1       Network adapter 2     2550/   187175/  0.6     6/        360/  0.0
  vCenter2       Network adapter 2     418615/ 30678024/ 99.4   1904439/ 1145654613/100.0
Summary                              421165/ 30865199/100.0   1904445/ 1145654973/100.0
switch>
```
19.6.4.13  show vmtracer vxlan segment

The `show vmtracer vxlan segment` command displays information about the VXLAN segments that are managed by the connected NSX for vSphere® (NSX-V).

**Command Mode**

EXEC

**Command Syntax**

`show vmtracer segment ENTITY`

**Parameters**

- ENTITY specifies the information that the command displays. Options include:
  - `<no parameter>` displays information for VXLAN segments.
  - `pool` displays resource pools available to segments.
  - `pool pool_name` displays connection information about the specified pool.
  - `range` displays the VNI range of the managed segments.

**Examples**

- This command displays the VXLAN segments managed by the NSX-V.
  ```
  switch>show vmtracer vxlan segment
  Name                    VNI    Multicast IP     Network Scope
  --------------------------------------------------------------------
  Eng Wire                5002    237.0.0.1        abcde
  HR Wire                 5000    237.0.0.2        abcde
  switch>
  ```

- This command displays the resource pools available to the VXLANs.
  ```
  switch>show vmtracer vxlan segment pool
  Name                  Description                     Segments
  ------------------------------------------------------------
  abcde                 Spans Cluster 1 and Cluster 2   Eng Wire, HR Wire
  switch>
  ```

- This command displays connection and packet information for the abcde pool.
  ```
  switch>show vmtracer vxlan segment pool abcde
  Name: abcde
  Description: Spans Cluster 1 and Cluster 2
  Segments: Eng Wire, HR Wire
  Vxlan Segment Cluster     Host                  VTEP IP     DVS      VLAN  MTU
  Eng Wire          Cluster2  test2.example.com  10.168.200.1/24  dvs-test2  200   1600

19.6.4.14  show vmtracer vxlan vm

The `show vmtracer vxlan vm` command displays the VXLAN segments, their VTEP IP numbers, and their VM endpoints that are managed by the connected NSX for vSphere® (NSX-V).

**Command Mode**

EXEC

**Command Syntax**

`show vmtracer vxlan vm`

**Examples**

- This command displays the VM endpoints of the VXLAN segments managed by the NSX-V.

```plaintext
switch>show vmtracer vxlan vm
Vxlan Segment   VTEP IP            VLAN  VMs
Eng Wire        192.168.200.1/24   200   Eng VM3, Eng VM2
Eng Wire        192.168.100.1/24   100   Eng VM1
HR Wire         192.168.100.1/24   100   HR VM2, HR VM1
HR Wire         192.168.200.1/24   200   --
switch>
```
Visibility and Monitoring Services

19.6.4.15 source-interface

The source-interface command allows you to connect to a remote vCenter endpoint by using the primary address of the interface as the source IP address. If the interface is not specified, the source IP address is determined by the routing table.

The no source-interface and default source-interface commands restore default behavior by removing the source-interface command from the running-config.

Command Mode
Vmtracer Configuration

Command Syntax

source-interface [INTERFACE_NAME]
no source-interface
default source-interface

Parameters

- INTERFACE_NAME specifies the interface for which the information is displayed. Options include:
  - Ethernet e_num specifies the Ethernet interface number.
  - Loopback l_num specifies the loopback interface number. Value ranges from 0 to 2100.
  - Management m_num specifies the management interface number. The values are 1 or 2.
  - Port-Channel {lag_num | lag_num.sub_num} specifies the port-channel interface number. Value of interface ranges from 1 to 2000. Value of sub-interface ranges from 1 to 4094.
  - Tunnel tunnel_num specifies the tunnel interface number. Value ranges from 1 to 255.
  - UnconnectedEthernet port_num specifies the unconnected Ethernet port number. Value ranges from 1 to 8.
  - VLAN vlan_num specifies the VLAN interface number. Value ranges from 1 to 4094.

Related Commands

- vmtracer session places the switch in Vmtracer configuration mode.

Examples

- This command configures VM Tracer to use Ethernet interface 17 to derive the source address for session packets.

  switch(config)#vmtracer session system_1
  switch(config-vmtracer-session-system_1)#source-interface Ethernet 17
  switch(config-vmtracer-session-system_1)#

- This command configures a loopback interface 0 for VM Tracer session.

  switch(config)#vmtracer session system_1
  switch(config-vmtracer-session-system_1)#source-interface Loopback 0
  switch(config-vmtracer-session-system_1)#

- This command configures management interface 1 for VM Tracer session.

  switch(config)#vmtracer session system_1
  switch(config-vmtracer-session-system_1)#source-interface management 1
  switch(config-vmtracer-session-system_1)#

- This command configures port-channel interface 10 for VM Tracer session.

  switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface port-channel 10
switch(config-vmtracer-session-system_1)#

- This command configures tunnel interface 25 for VM Tracer session.

switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface tunnel 25
switch(config-vmtracer-session-system_1)#

- This command configures unconnected Ethernet interface 1 for VM Tracer session.

switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface unconnected Ethernet 1
switch(config-vmtracer-session-system_1)#

- This command configures VLAN interface 25 for VM Tracer session.

switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#source-interface vlan 25
switch(config-vmtracer-session-system_1)#
19.6.4.16  url (vmtracer mode)

The `url` command specifies the vCenter server location that is monitored by the session being edited by the current vmtracer mode. The command must reference a fully formed secure url.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
url url_name
```

**Parameters**

- `url_name` location of the vCenter server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command specifies the location of the vCenter monitored by the system_1 VM Tracer session.

```
switch(vmtracer-system_1)#url https://example.com/sdk
switch(vmtracer-system_1)#
```
19.6.4.17  **url (vmtracer-vxlan mode)**

The `url` command specifies the NSX for vSphere® (NSX-V) server location that is monitored for VXLAN information by the configuration mode VM Tracer session. The command must reference a fully formed secure URL.

The `url` statement is replaced in running-config for the configuration mode session by a subsequent `url` command. The statement is removed by deleting the NSX-V instance through a `no vxlan (vmtracer mode)` command in vmtracer configuration mode.

**Command Mode**

Vmtracer-vxlan Configuration

**Command Syntax**

```
url url_name
```

**Parameters**

- `url_name`  location of the NSX-V server. Valid formats include IP address (dotted decimal notation) and fully qualified domain name.

**Related Commands**

- `vxlan (vmtracer mode)` places the switch in vmtracer-vxlan configuration mode.

**Example**

- This command configures the location of the NSX-V monitored by the vnet-1 VM Tracer session.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
  allowed-vlan 1-4094
  vxlan
    url https://example.com/sdk
switch(config-vmtracer-vnet-1)#
```
19.6.4.18  username (vmtracer mode)

The `username` command identifies the switch’s account name on the vCenter server. The switch uses this user name to access vCenter information.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

`username name_string`

**Parameters**

- `name_string`  vCenter account user name. Parameter must match the user name configured on the vCenter.

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Example**

- This command configures the user name for the vCenter associated with the system_1 session. The session uses this user name to log into the vCenter server.

```
switch(vmtracer-system_1)#username a-switch_01
switch(vmtracer-system_1)#
```
19.6.4.19  **username (vmtracer-vxlan mode)**

The **username** command identifies the switch’s account name on the NSX for vSphere® (NSX-V) server located at the URL configured for the configuration mode VM Tracer. The switch uses this user name to access NSX-V information.

The **username** statement is replaced in **running-config** for the configuration mode interface by a subsequent **username** command. The statement is removed by deleting the NSX-V instance through a **no vxlan (vmtracer mode)** command in vmtracer configuration mode.

**Command Mode**

Vmtracer-vxlan Configuration

**Command Syntax**

```
username name_string
```

**Parameters**

- **name_string**  NSX-V account user name. Parameter must match a user name configured on the NSX-V.

**Related Commands**

- **vxlan (vmtracer mode)** places the switch in vmtracer-vxlan configuration mode.

**Example**

- This command configures the user name of admin for the NSX-V located at the URL specified by the URL command.

```bash
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#url https://example.com/sdk
switch(config-vmtracer-vnet-1-vxlan)#username admin
switch(config-vmtracer-vnet-1-vxlan)#exit
switch(config-vmtracer-vnet-1)#show active
vmtracer session vnet-1
    allowed-vlan 1-4094
    vxlan
        url https://example.com/sdk
        username admin
switch(config-vmtracer-vnet-1)#
```
19.6.4.20 vmtracer session

The `vmtracer session` command places the switch in vmtracer mode for the specified session. The command creates a new session or loads an existing session for editing.

A VM Tracer session connects the switch to a vCenter server at a specified location, then downloads data about VMs and vSwitches managed by ESX hosts connected to switch ports. The switch supports a maximum of four VM Tracer sessions.

VM Tracer session parameters are configured in vmtracer mode. Parameters configured in vmtracer mode include the vCenter location and dynamic VLAN usage.

The `no vmtracer session` and `default vmtracer session` commands disable the session and remove its configuration from `running-config`.

Command Mode

Global Configuration

Command Syntax

```
vmtracer session name
no vmtracer session name
default vmtracer session name
```

Parameters

- `name` The label assigned to the VM Tracer session.

Commands Available in vmtracer Configuration Mode

- `allowed-vlan`
- `autovlan disable`
- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`
- `vxlan (vmtracer mode)`

Examples

- This command enters vmtracer mode for the system_1 session.

```
switch(config)#vmtracer session system_1
switch(vmtracer-system_1)#
```

- This command disables the system_1 VM Tracer session. The system_1 session and all of its parameters are removed from `running-config`.

```
switch(config)#no vmtracer session system_1
switch(config)#
```
19.6.4.21 vmtracer

The `vmtracer` command enables vmtracer mode on the configuration mode interface. Interfaces with vmtracer mode enabled send discovery packets to the connected vSwitch.

The `no vmtracer` and `default vmtracer` commands disable vmtracer mode on the configuration mode interface by removing the corresponding `vmtracer` command from `running-config`.

**Command Mode**

Interface-Ethernet Configuration Interface-Port-channel Configuration

**Command Syntax**

`vmtracer HOST_TYPE`
`no vmtracer HOST_TYPE`
`default vmtracer HOST_TYPE`

**Parameters**

- `HOST_TYPE` the type of hypervisor that controls the vSwitch to which the interface connects.
  - `vmware-esx` ESX or ESXI hypervisor (VMware).

**Examples**

- These commands enable vmtracer mode on the Ethernet 3 interface.

  switch(config)#interface Ethernet 3
  switch(config-if-Et3)#vmtracer vmware-esx
  switch(config-if-Et3)#

- This command disables vmtracer mode on the Ethernet 3 interface.

  switch(config-if-Et3)#no vmtracer vmware-esx
  switch(config-if-Et3)#
19.6.4.22 vrf (vmtracer mode)

The `vrf` command allows the switch to communicate with a vCenter server by enabling VmTracer configuration mode. By default, VmTracer is enabled only in the default vrf command.

**Command Mode**
Vmtracer Configuration

**Command Syntax**

```
vrf vrf_name
```

**Parameters**

- `vrf_name` specifies information of the corresponding VRF.

**Example**

- These commands place the VRF vrf1 in the Vmtracer configuration mode.

```
switch(config)#vmtracer session system_1
switch(config-vmtracer-session-system_1)#vrf vrf1
switch(config-vmtracer-session-system_1)#
```
19.6.4.23 vxlan (vmtracer mode)

The `vxlan` command places the switch in vmtracer-vxlan configuration mode. To monitor VXLAN based VMware configurations, the switch must communicate with a NSX for vSphere® (NSX-V). Vmtracer-vxlan configuration mode specifies the location and user account data that allows the switch to access a NSX-V within the configuration mode vmtracer session. Each VM Tracer session can be associated with one NSX-V instance.

The `no vxlan` and `default interface vxlan` commands delete the NSX-V instance from the configuration mode vmtracer session by removing all vmtracer-vxlan mode commands from `running-config`.

**Command Mode**

Vmtracer Configuration

**Command Syntax**

```
vxlan
no vxlan
default vxlan
```

**Related Commands**

- `vmtracer session` places the switch in vmtracer configuration mode.

**Commands Available in vmtracer-vxlan Configuration Mode**

- `password (vmtracer mode)`
- `url (vmtracer mode)`
- `username (vmtracer mode)`

**Example**

- These commands create the vShield instance for the VMTracer session named vnet-1.

```
switch(config)#vmtracer session vnet-1
switch(config-vmtracer-vnet-1)#vxlan
switch(config-vmtracer-vnet-1-vxlan)#
```

19.7 MapReduce Tracer

This section describes Arista's implementation of MapReduce Tracer, including configuration instructions and command descriptions. Topics covered by this section include:

- MapReduce Tracer Introduction
- MapReduce Tracer Configuration
- Displaying MapReduce Tracer Results
- MapReduce Tracer Command Descriptions

19.7.1 MapReduce Tracer Introduction

MapReduce Tracer is a network tool that monitors Hadoop nodes that are directly connected to Arista switches. MapReduce Tracer requires the following:

- Hadoop clusters are deployed with a L3 design.
- The top of rack switch is the default gateway to all attached TaskTracker nodes.
- JobTracker RPC ports do not require authentication.
- Nodes cannot simultaneously belong to multiple Hadoop clusters.
Visibility and Monitoring Services

- All TaskTrackers within a cluster are accessed through a common HTTP access port.
- The switch’s DNS or static host configuration facilitates TaskTracker name resolution.

Map Reduce Tracer supports these Hadoop releases:
- Apache 0.20.205
- Apache 1.2.1
- Cloudera 3u6
- Cloudera 4.1.3
- Cloudera 4.3.0
- HortonWorks 1.3
- Cloudera 4.5.0

These sections briefly describe Hadoop, Hadoop data structures, and MapReduce Tracer.

19.7.1.1 Hadoop Description

Apache Hadoop is an open-source, Java-based software framework that supports large dataset storage and processing in a distributed computational environment. Hadoop is licensed under Apache License 2.0 and developed through a global community.

Hadoop facilitates application execution on systems composed of thousands of nodes utilizing petabytes of data. Its distributed file system facilitates rapid data transfer among nodes and supports continued operations when individual nodes fail or become inaccessible.

Hadoop Distributed File System (HDFS) is a distributed file-system that stores data on the commodity machines to provide high aggregate bandwidth across the cluster.

19.7.1.2 Hadoop Cluster Structure

A cluster is a group of servers that function as a single system to provide high availability through load balancing and parallel processing. A Hadoop cluster is a type of computational cluster designed for storing and analyzing large amounts of unstructured data in a distributed computing environment.

Typical Hadoop clusters include one master and multiple worker nodes. The master node consists of a TaskTracker, JobTracker, NameNode and DataNode. Worker nodes include a TaskTracker and DataNode.

19.7.1.3 Map Reduce

MapReduce is an algorithm that Hadoop implements to process large datasets by distributing parallel tasks to nodes within a cluster. The MapReduce program includes a Map procedure that filters data and a Reduce procedure that processes the data.

MapReduce manages task and data distribution to cluster nodes such that tasks are executed in parallel, and data transfers between cluster components support redundancy and fault tolerance.

The MapReduce engine consists of one JobTracker and multiple TaskTrackers – all nodes within the Hadoop cluster. The JobTracker receives MapReduce jobs from a client application and manages the completion of these jobs by submitting tasks to available TaskTracker nodes. If a TaskTracker fails to perform the assigned task, the JobTracker reschedules that part of the job to another node.

19.7.1.4 MapReduce Tracer Function

MapReduce Tracer is a feature that tracks and interacts with Hadoop nodes directly connected to Arista switches in a cluster. It communicates with a JobTracker to obtain a list of all nodes in a cluster and then queries JobTracker and TaskTrackers on these nodes for information regarding the jobs they are running and progress of those jobs. This creates a map of TaskTrackers with kinds of jobs they are running. Commands are available to display this data in tables through the CLI and EAPI.
MapReduce Tracer monitors only nodes that connect directly to the switch in L3 networks. Directly connected nodes use the top-of-rack switch as their default gateway and the switch learns ARP entries for these nodes. The list of nodes provided by JobTracker is filtered by tracking ARP entries to remove nodes that are not directly accessible.

MapReduce Tracer creates a database of nodes from the filtered list. After the database is created, the switch queries the JobTracker and TaskTrackers to obtain the following:

- The number of monitored Hadoop nodes.
- The list of monitored nodes, including their IP addresses.
- Jobs that the TaskTrackers are running.
- JobTracker and TaskTracker statistics.

MapReduce Tracer can simultaneously monitor multiple clusters. This means the directly connected TaskTracker nodes can belong to different clusters. A maximum of five clusters are supported per switch.

19.7.2 MapReduce Tracer Configuration

MapReduce Tracer configuration commands are structured into two configuration levels:

- Monitor-hadoop configuration mode is a child of global configuration mode and controls global MapReduce Tracer settings.
- Monitor-hadoop-cluster configuration mode is a child of Monitor-hadoop configuration mode and defines polling configurations that monitor individual Hadoop clusters.

These sections describe MapReduce Tracer configuration processes:

- MapReduce Tracer Global Configuration
- Hadoop Cluster Access Configuration
- MapReduce Tracer Example

MapReduce Tracer functions after it is enabled globally. Each polling configuration can be individually enabled after the feature is enabled globally.

19.7.2.1 MapReduce Tracer Global Configuration

MapReduce Tracer global parameters are configured in Monitor-hadoop configuration mode. Tasks performed from this mode include specifying connection parameters to Hadoop clusters and globally enabling MapReduce Tracer.

Entering Monitor-Hadoop Configuration Mode

Monitor-hadoop configuration mode is entered by monitor hadoop. Monitor-hadoop configuration mode is not a group change mode; statements are stored in the running-config when they are entered through the CLI. The exit command returns the switch to global configuration mode.

Examples

- These commands place the switch in monitor-hadoop configuration mode.
  ```
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#
  ```

- This command exits monitor-hadoop mode.
  ```
  switch(config-monitor-hadoop)#exit
  switch(config)#
  ```
Visibility and Monitoring Services

- This command deletes all previously configured monitor-hadoop configuration mode commands.

```plaintext
switch(config)#no monitor hadoop
switch(config)#
```

Globally Enabling MapReduce Tracer

MapReduce Tracer is globally enabled by the `no` version of the `shutdown (Monitor-Hadoop)`. MapReduce Tracer is globally disabled by default.

**Example**

These commands globally enable MapReduce Tracer.

```plaintext
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
monitor hadoop
  no shutdown
switch(config-monitor-hadoop)#
```

Creating a Cluster Monitor

A cluster monitor is created by entering monitor-hadoop-cluster mode with `cluster (Monitor Hadoop)`. Each monitor is labeled with a cluster ID and probes one Hadoop cluster. When the command specifies a monitor with a previously defined cluster ID, subsequent commands edit that monitor’s parameters. A monitor with a new cluster ID is created by a command that specifies a nonexistent cluster ID.

**Example**

These commands enter monitor-hadoop-cluster mode to edit a cluster monitor. The monitor’s cluster-id is `CL2`.

```plaintext
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#
```

19.7.2.2 Hadoop Cluster Access Configuration

Cluster monitors are configured in monitor-hadoop-cluster configuration mode. Each monitor corresponds to a hadoop cluster through these configurable parameters:

- JobTracker access parameters (address, port number, and username)
- TaskTracker access port
- Polling interval
- Cluster description
- Enabled setting
The minimum explicit configuration includes JobTracker address and username; default values are defined for all other parameters. By default, cluster monitors are disabled.

The cluster (Monitor Hadoop) command places the switch in monitor-hadoop-cluster mode for the specified monitor, where a cluster’s connection parameters are specified. Monitor-hadoop-cluster mode is not a group change mode.

A cluster monitor is enabled by using the no version of the shutdown (Monitor-Hadoop) when MapReduce Tracer is globally enabled.

19.7.2.2.1 JobTracker Configuration

A cluster’s JobTracker is located on the master node and schedules work to the cluster’s TaskTracker nodes. The jobtracker (Monitor Hadoop Cluster) command specifies connection parameters to the monitored cluster.

JobTracker parameters include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured.

Example

For the CL2 monitor, these commands configure connection parameters to a JobTracker node at 10.4.4.4 with the username account1. The default RPC port (8021) is implicitly specified.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4
    username account1
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
    jobtracker host 10.4.4.4 user account1
switch(config-monitor-hadoop-CL2)#
```

19.7.2.2.2 TaskTracker Configuration

The tasktracker (Monitor Hadoop Cluster) command specifies the HTTP port that access TaskTrackers of the Hadoop cluster probed by the configuration mode monitor. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker.

The default TaskTracker HTTP port is 50060.

Examples

- For the CL2 monitor, these commands configure a TaskTracker access port of 51000.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
    tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```
• These commands restore the default TaskTracker HTTP access port address of **50060**.

```plaintext
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
switch(config-monitor-hadoop-CL2)#show active all
monitor hadoop
    cluster CL2
        jobtracker rpc-port 8021
        tasktracker http-port 50060
        interval 10
        shutdown
switch(config-monitor-hadoop-CL2)#
```

### 19.7.2.2.3 Polling Interval Configuration

When the monitor configuration is complete, the switch polls the cluster’s JobTracker to maintain the list of active TaskTracker nodes associated with the monitored cluster and compile Hadoop job statistics. The `interval (Monitor Hadoop Cluster)` command specifies the interval between polls to the JobTracker of the monitored cluster. The default interval is **10** seconds.

**Example**

This command sets the JobTracker polling interval to **25** seconds for the cluster monitored by the CL2 MapReduce Tracer configuration.

```plaintext
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
        interval 25
switch(config-monitor-hadoop-CL2)#
```

### 19.7.2.3 MapReduce Tracer Example

The commands in this section create monitors that probe two Hadoop clusters, enables each monitor individually, then enables MapReduce Tracer globally. Monitor parameters for the clusters include:

- **Cluster ID: CL_1**
  - JobTracker: IP address: **10.15.2.2**, RPC port: **8021**; username: **xyz1**
  - TaskTracker: HTTP address **54000**
  - JobTracker polling interval: **10** seconds (default)

- **Cluster ID: CL_2**
  - JobTracker: IP address: **10.21.5.2**, RPC port: **9521**; username: **qrst4**
  - TaskTracker: HTTP address **50060** (default)
  - JobTracker polling interval: **5** seconds

**Example**

```plaintext
switch(config)#monitor hadoop
```
19.7.3 Displaying MapReduce Tracer Results

MapReduce Tracer display commands provide information about the configuration and activity on the monitored clusters.

This section contains the following topics:

- MapReduce Tracer Status
- Cluster Configuration and Connections
- Job Lists
- Job Data
- TaskTracker Lists
- TaskTracker Connection and Activity
- Data Bursts
• Low-memory Mode

19.7.3.1 MapReduce Tracer Status

MapReduce Tracer status is accessed through `show monitor hadoop status`. Status information includes the enabled status and the number of monitored clusters, TaskTrackers, and locally running jobs.

**Example**

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch>show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
  Admin status                            : Enabled
  Operational status                      : Enabled
  Number of clusters configured           : 3
  Number of local TaskTrackers            : 4
  Number of jobs running locally          : 4

switch>
```

19.7.3.2 Cluster Configuration and Connections

The following cluster configuration and connection information is available through these commands:

• Configuration and connection data for all monitored clusters — `show monitor hadoop cluster all`.
• Configuration and connection data for a specified cluster — `show monitor hadoop cluster status`.
• Connection and activity information for TaskTrackers in a specified cluster, on a specified node, or accessed through a specified interface — `show monitor hadoop tasktracker status`.

**Example**

This command displays configuration and connection data for the `Cluster0` cluster.

```
switch>show monitor hadoop cluster Cluster0 status
Last updated: 2013-10-06 18:14:23
Cluster status for cluster:  Cluster0
  Admin status             : Enabled
  JobTracker host          : host0
  JobTracker RPC port      : 9000
  JobTracker user          : user0
  JobTracker polling interval : 100 seconds
  TaskTracker HTTP port    : 8800
  Operational status       : Enabled
  Active TaskTrackers      : 31
  Blacklisted TaskTrackers : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval  : 20.0
  Map slots (used/total)   : 10/100
  Reduce slots (used/total) : 11/110
  JobTracker heap size     : 1.04GB (max: 2.08GB)
```

19.7.3.3 Job Lists

The following commands display rosters of currently running job or jobs that previously ran:

- Jobs running on all monitored Hadoop clusters – `show monitor hadoop`.
- Jobs running on a specified cluster and byte counter data – `show monitor hadoop cluster counters`.
- Jobs that previously ran on a specified cluster – `show monitor hadoop cluster history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared – `clear monitor hadoop job-history`.
- Jobs running on a specified cluster – `show monitor hadoop cluster jobs`.
- Jobs that ran on all configured clusters is accessed through `show monitor hadoop history`.
  - Includes jobs that ran since the monitor was enabled, the switch was reloaded, or the job history was cleared – `clear monitor hadoop job-history`.
- Jobs running on a specified TaskTracker and byte counter data – `show monitor hadoop tasktracker counters`.

**Examples**

- This command displays the jobs that are running on all monitored clusters.

```
switch>show monitor hadoop
Last updated: 2013-10-06 18:14:23
Currently running jobs: 4
JobId  Job Name         Cluster   Maps(#/%)  Reduces(#/%)  Start Time
------- ---------------- --------- ---------- ------------- -------------
1       ReallyAVeryLon\  Cluster0  2/12.34%   0/13.45%      2013-10-06
510001  gNameForAJob1   Cluster1  2/12.34%   0/13.45%      2013-10-06
2       ShortName2       Cluster0  2/24.68%   0/26.90%      2013-10-06
510002  ShortName12      Cluster1  2/24.68%   0/26.90%      2013-10-06
switch>
```

- This command displays data the jobs that previously ran on connected Hadoop clusters.

```
switch>show monitor hadoop history
Job history for all clusters:
JobId  Job Name         Cluster   Start Time   End Time     Bytes In  Bytes Out
------- ---------------- --------- ----------- ------------ ----------

```
Visibility and Monitoring Services

19.7.3.4 Job Data

The following commands display information about jobs that are running or previously ran on monitored clusters. Available data include job identifiers, JobTracker ID, start time, stop time, data consumption, and progress statistics.

- Data consumption, start and stop times, and JobTracker ID for a specific job —show monitor hadoop cluster history jobs.
- Data consumption, start and stop times, priority, JobTracker ID, and progress statistics for a specified job —show monitor hadoop cluster jobs <job number>.
- HDFS (Hadoop Distributed File System) data consumption and shuffle byte counters for a specified job —show monitor hadoop cluster jobs counter.
- Data through and start time for jobs running on all monitored clusters —show monitor hadoop counters.
- Progress statistics and start times are available for jobs running on specified TaskTracker —show monitor hadoop tasktracker jobs.
- Job progress and byte counts of jobs running on a specified Hadoop cluster —show monitor hadoop tasktracker running-tasks.
- Progress statistics, HDFS data consumption, start time, and progress information for the specified task of a running job —show monitor hadoop tasktracker running-tasks cluster job task.
- Data consumption and start times for jobs running on a specified TaskTracker —show monitor hadoop tasktracker counters.

Examples

- This command displays information about job 1 that ran on cluster Cluster0.

  switch>show monitor hadoop cluster Cluster0 history job 1

  Job history data for job: HistoryJob1
Cluster                  : Cluster0
Job Id                   : 1
JT Id                    : 201310110013
User                     : HistoryUser1
Job start time           : 2013-10-06 17:57:43
Job end time             : 2013-10-08 00:31:03

Per Interface job counters:

<table>
<thead>
<tr>
<th>Interface</th>
<th>TaskTracker</th>
<th>Bytes In</th>
<th>Bytes Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet7</td>
<td>TaskTracker2</td>
<td>26.08GB</td>
<td>13.04GB</td>
</tr>
</tbody>
</table>

• This command displays information about job 1 that is running on cluster集群 Cluster0.

switch> show monitor hadoop cluster Cluster0 jobs 1

Last updated: 2013-10-06 18:14:23
Information for job: ReallyAVeryLongNameForAJob1 running on cluster: Cluster0
Cluster                  : Cluster0

19.7.3.5 TaskTracker Lists

These commands display lists of TaskTrackers that are active on monitored clusters:

• TaskTrackers on a specified cluster –show monitor hadoop cluster tasktracker.
• TaskTrackers on all monitored clusters-show monitor hadoop tasktracker all.
Example

This command displays the TaskTrackers on the **Cluster0** cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker
```

<table>
<thead>
<tr>
<th>Node</th>
<th>IP Address</th>
<th>Interface</th>
<th>Maps</th>
<th>Reduces</th>
</tr>
</thead>
<tbody>
<tr>
<td>TaskTracker1</td>
<td>10.100.0.1</td>
<td>Ethernet7</td>
<td>4</td>
<td>0</td>
</tr>
<tr>
<td>TaskTracker2</td>
<td>10.100.0.2</td>
<td>Port-Channel7</td>
<td>4</td>
<td>0</td>
</tr>
</tbody>
</table>

**19.7.3.6 TaskTracker Connection and Activity**

The following TaskTracker connection and activity data is available through these commands:

- Connection and activity information for TaskTrackers on a specified cluster or accessed through a specified interface –`show monitor hadoop tasktracker status`.
- Data consumption for TaskTrackers connected to monitored clusters -`show monitor hadoop tasktracker all counters`.

Example

This command displays connection and activity data for TaskTracker on the **TaskTracker1** node.

```
switch>show monitor hadoop tasktracker host TaskTracker1 status
```

Example

<table>
<thead>
<tr>
<th>TaskTracker</th>
<th>IP Address</th>
<th>Interface</th>
<th>Maps</th>
<th>Reduces</th>
</tr>
</thead>
<tbody>
<tr>
<td>TaskTracker1</td>
<td>10.100.0.1</td>
<td>Ethernet7</td>
<td>4</td>
<td>0</td>
</tr>
</tbody>
</table>

**19.7.3.7 Data Bursts**

The `show monitor hadoop traffic burst` command displays the largest data bursts for jobs running on a specified cluster or accessed through a specified node or interface. A data burst is the data consumed during a polling interval.

Example
This command displays traffic burst data for all running jobs that are accessible through port channel interface 7.

```
switch>show monitor hadoop traffic burst interface Port-Channel 7
Last updated: 2013-10-06 18:14:23
Bursts on Interface: 'Port-Channel7' in cluster: Cluster0
Top 2 input bursts:
JobId  Job Name              Burst     Time
------- --------------------- ------------ -------------
1       ShortName             3.07GB    2013-10-06 17:57:43
2       ReallyAVeryLon\ gNameForAJob 6.15GB    2013-10-06 17:41:03

Top 2 output bursts:
JobId  Job Name              Burst     Time
------- --------------------- ------------ -------------
1       ShortName             4.10GB    2013-10-06 17:55:13
2       ReallyAVeryLon\ gNameForAJob 8.20GB    2013-10-06 17:36:03
```

19.7.3.8  Low-memory Mode

Switch behavior can be improved using the **memory exhaustion** command when the switch gets low on available memory. This low-memory or Out-of-Memory (OOM) state is caused by a number of individual or a combination of factors including the one listed below:

- Memory leaks in EOS or customer user processes.
- Process leaks to too many processes or scripts running at one time.
- Over configuration of the system requiring more memory than available.
- Large number of temporary (tmpfs) files such as logs.
- Large number of CLI sessions.
- Any event or agents that can consume more memory than available in the system.

Once the low-memory state is reached, the system uses the oom_score, which depends on the value of the oom_score_adj parameter to kill processes to free up available memory. The value for the parameter ranges from -1000 (will not be shut down) to 1000 (will be shut down first) during an OOM state. Non-essential agents are assigned oom_score_adj values of 900 or greater.

When enabled, the system implements the following:

- Non-essential agents shut down by Linux are not restarted.
- CLI is restarted, and a message: "Restarting CLI due to memory exhaustion on the system" is sent to all login sessions in the switch.
- CLI Scheduler is disabled.

The system requires manual intervention through **reset system memory exhaustion** command to exit the mode and restart the agents that were shut down.

**Configuring Low-memory Mode**

The following examples are applicable to all platforms.

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
</table>

3462
These commands configure the low-memory mode.

```
switch(config)#monitor system
switch(config-monitor-system)#memory exhaustion
switch(config-monitor-system-memory)#action agent non-critical
    hold-down
```

### Example

The following command disables low-memory mode in config-monitor-system-memory.

```
switch(config-monitor-system-memory)#no action agent non-critical
    hold-down
```

The following command exits low-memory mode after an OOM event has occurred and agents have been shut down. The command restarts the agents being held down and reenables the CLI scheduler.

```
switch(config-monitor)#reset system memory exhaustion
```

The `show monitor system` command shows the state of the system with the following information:

- If the feature is enabled.
- If the system is in low-memory mode (featured enabled and system experiencing OOM).
- How many times the system entered low-memory mode.
- Last time the system entered low-memory mode (if applicable).
- Last time the system exited low-memory mode (if applicable).

### Example

```
switch#show monitor system
```

The following output is for a system where the feature is disabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: False
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 
```

The following output is for a system where the feature is enabled and the system has never entered the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: False
Number of times system entered Memory Exhaustion: 0
```

The following output is for a system where the feature is enabled and the system enters the low-memory mode.

```
Memory Exhaustion Feature enabled: True
System currently in Memory Exhaustion: True
Number of times system entered Memory Exhaustion: 1
Last time entered in Memory Exhaustion: 0:00:07 ago
```
The following output is for a system where the feature is enabled and the system enters the low-memory mode once, and has exited the low-memory mode.

<table>
<thead>
<tr>
<th>Memory Exhaustion Feature enabled: True</th>
</tr>
</thead>
<tbody>
<tr>
<td>System currently in Memory Exhaustion: False</td>
</tr>
<tr>
<td>Number of times system entered Memory Exhaustion: 1</td>
</tr>
<tr>
<td>Last time entered in Memory Exhaustion: 0:01:00 ago</td>
</tr>
<tr>
<td>Last time exited from Memory Exhaustion: 0:00:05 ago</td>
</tr>
</tbody>
</table>

**Configuring oom_score_adj for a daemon agent**

To configure the oom_score_adj of any configured daemon, use the following command:

```
switch(config-daemon-<daemon_name>)# oom score adjustment <score>
```

**Note:** Similar to change the daemon heartbeat value, the new oom_score_adj value for the daemon is in effect after restarting the daemon by using `shutdown` command followed by a `no shutdown` command.

```
switch(config)# daemon daemonName
switch(config-daemon-daemonName)# oom score adjustment -200
switch(config-daemon-daemonName)# shutdown
switch(config-daemon-daemonName)# no shutdown
```
19.7.4 MapReduce Tracer Command Descriptions

Global Configuration Commands
• monitor hadoop

Clear Hadoop Monitor Commands
• clear monitor hadoop burst-counters
• clear monitor hadoop job-history

Display Commands
• show agent oom scores
• show monitor hadoop
• show monitor hadoop cluster all
• show monitor hadoop cluster counters
• show monitor hadoop cluster history
• show monitor hadoop cluster history jobs
• show monitor hadoop cluster jobs
• show monitor hadoop cluster jobs <job number>
• show monitor hadoop cluster jobs counter
• show monitor hadoop cluster status
• show monitor hadoop cluster tasktracker
• show monitor hadoop counters
• show monitor hadoop history
• show monitor hadoop status
• show monitor hadoop tasktracker all
• show monitor hadoop tasktracker all counters
• show monitor hadoop tasktracker counters
• show monitor hadoop tasktracker jobs
• show monitor hadoop tasktracker running-tasks
• show monitor hadoop tasktracker running-tasks cluster job task
• show monitor hadoop tasktracker status
• show monitor hadoop traffic burst
• show monitor system

Hadoop Commands
• cluster (Monitor Hadoop)
• shutdown (Monitor-Hadoop)

Hadoop-Cluster Commands
• description (Monitor Hadoop Cluster)
• interval (Monitor Hadoop Cluster)
• jobtracker (Monitor Hadoop Cluster)
• shutdown (Monitor Hadoop Cluster)
• tasktracker (Monitor Hadoop Cluster)
19.7.4.1 clear monitor hadoop burst-counters

The clear monitor hadoop burst-counters command resets MapReduce Tracer burst counters for all jobs running on specified clusters.

Command Mode
Privileged EXEC

Command Syntax
clear monitor hadoop burst-counters [CLUSTERS]

Parameters
• CLUSTERS Hadoop clusters for which command displays data. Options include:
  • no parameter All clusters.
  • cluster c_name Cluster name.

Example
This command clears the burst counters for all jobs running on CL2 cluster.

switch# clear monitor hadoop burst-counters cluster CL2
Cleared burst counters
switch#
19.7.4.2  clear monitor hadoop job-history

The `clear monitor hadoop job-history` command resets the job history database for all specified clusters.

**Command Mode**
Privileged EXEC

**Command Syntax**
```
clear monitor hadoop job-history [CLUSTERS]
```

**Parameters**
- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` All clusters.
  - `cluster c_name` Cluster name.

**Example**
This command clears the job history on the `CL2` cluster.
```
switch# clear monitor hadoop job-history cluster CL2
Cleared job history
switch#
```
19.7.4.3  cluster (Monitor Hadoop)

The `cluster` command is a monitor-hadoop command that places the switch in monitor-hadoop-cluster mode for configuring and enabling a MapReduce Tracer monitor for a Hadoop cluster. The command either accesses an existing monitor configuration or creates a monitor.

Monitor-hadoop-cluster configuration mode is not a group change mode; `running-config` is changed immediately upon entering commands. Exiting monitor-hadoop-cluster mode does not affect `running-config`. The `exit` command returns the switch to monitor-hadoop configuration mode.

The configuration mode monitor is enabled by the no version of the `shutdown (Monitor Hadoop Cluster)`. Enabling a monitor also requires that MapReduce Tracer is globally enabled (`shutdown (Monitor Hadoop Cluster)`).

The no `cluster` and `default cluster` commands remove the specified Hadoop cluster configuration from `running-config`.

**Command Mode**
Monitor-hadoop Configuration

**Command Syntax**

```
cluster cluster_name
no cluster cluster_name
default cluster cluster_name
```

**Parameters**

- `cluster_name`  Hadoop cluster name.

**Related Commands**

- `monitor hadoop` places the switch in monitor-hadoop configuration mode.

**Commands Available in Monitor-hadoop-cluster Configuration Mode**

- `description (Monitor Hadoop Cluster)`
- `interval (Monitor Hadoop Cluster)`
- `jobtracker (Monitor Hadoop Cluster)`
- `shutdown (Monitor Hadoop Cluster)`
- `tasktracker (Monitor Hadoop Cluster)`

**Examples**

- These commands create the CL2 monitor and enters monitor-hadoop-cluster mode for the monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop-CL2)#
```

- These commands exit monitor-hadoop-cluster mode.

```
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
  cluster CL2
switch(config-monitor-hadoop)#
```
• These commands remove the CL2 monitor.

```bash
switch(config-monitor-hadoop)#no cluster CL2
switch(config-monitor-hadoop)#show active
switch(config-monitor-hadoop)#
```
19.7.4.4 description (Monitor Hadoop Cluster)

The `description` command adds a text string to the configuration mode MapReduce Tracer cluster monitor. The string has no functional impact on the monitor.

The `no description` and `default description` commands remove the text string from the configuration mode monitor by removing the corresponding `description` command from `running-config`.

Command Mode
Monitor-hadoop-cluster Configuration

Command Syntax

description label_text
no description
default description

Parameters

- `label_text` Character string assigned to the monitor configuration.

Related Commands

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

Example

These commands add description text to the CL2 monitor.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#description First Cluster
monitor hadoop
    cluster CL2
        description First Cluster
        jobtracker host 10.3.3.3 user JANE
switch(config-monitor-hadoop-CL2)#
```
19.7.4.5  interval (Monitor Hadoop Cluster)

The **interval** command specifies the polling interval between queries to the Hadoop cluster JobTracker specified by configuration mode statements. The switch polls a cluster’s JobTracker to update its list of active TaskTracker nodes and the statistics of jobs running in the cluster. This command controls the frequency of these polls. The default interval is 10 seconds.

The **no interval** and **default interval** commands restore the default interval of 10 seconds by removing the **interval** command from *running-config*.

**Command Mode**

Monitor-hadoop-cluster Configuration

**Command Syntax**

```
interval  period
no interval
default interval
```

**Parameters**

- **period** Interval (seconds) between JobTracker polls. Value ranges from 1 to 600. Default is 10.

**Related Commands**

- **cluster (Monitor Hadoop)** places the switch in monitor-hadoop-cluster configuration mode.

**Example**

This command sets the JobTracker polling interval to **25** seconds for the CL2 cluster configuration.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#interval 25
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
    interval 25
switch(config-monitor-hadoop-CL2)#
```
19.7.4.6  jobtracker (Monitor Hadoop Cluster)

The `jobtracker` command specifies JobTracker access parameters for the cluster monitored by configuration mode monitor statements. A cluster’s JobTracker is located on the master node and schedules work to the cluster’s TaskTracker nodes.

Parameters required to communicate with a JobTracker include its node location (IPv4 address or hostname), RPC port, and username. The default RPC port is 8021. Location and username parameters do not have default values and must be explicitly configured. A JobTracker command that specifies a partial parameter list modifies the existing corresponding `jobtracker` statement in `running-config`.

The `no jobtracker` and `default jobtracker` commands perform the following:

- removes the `jobtracker` statement from `running config` when it lists all command parameters.
- modifies the existing `jobtracker` statement when it lists a subset of command parameters.

**Command Mode**

Monitor-hadoop-cluster Configuration

**Command Syntax**

`jobtracker [LOCATION][PORT][USER]`

`no jobtracker[LOCATION][PORT][USER]`

`default jobtracker [LOCATION]][USER]`

All parameters may be placed in any order.

**Parameters**

- **LOCATION** Address or hostname of JobTracker node. Options include:
  - `<no parameter>` Location remains undefined or unchanged from a previous configuration.
  - `host ipv4_addr` IPv4 address of master (JobTracker) node.
  - `host hostname` Hostname of master (JobTracker) node.

- **PORT** JobTracker RPC port number. Default value is 8021. Options include:
  - `<no parameter>` Port number remains unchanged from previous configuration.
  - `rdp-port port_num` Port number of master (JobTracker) node. Value ranges from 1 to 65535.

- **USER** Username that accesses JobTracker node. Options include:
  - `<no parameter>` Username remains undefined or unchanged from previous configuration.
  - `username name_string` JobTracker username.

**Related Commands**

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

**Examples**

- For the CL2 cluster configuration, these commands establish a connection to the JobTracker node at 10.4.4.4 with the username `account1`. The default RPC port (8021) is implicitly specified.

```bash
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#jobtracker host 10.4.4.4 username account1
switch(config-monitor-hadoop-CL2)#show active

monitor hadoop
  cluster CL2
    jobtracker host 10.4.4.4 user account1
```
• These commands modify the JobTracker configuration to specify an RPC port of 9000.

```
switch(config-monitor-hadoop-CL2)# jobtracker rpc-port 9000
switch(config-monitor-hadoop-CL2)# show active

monitor hadoop
c  luster CL2
   jobtracker host 10.4.4.4 rpc-port 9000 user account1

switch(config-monitor-hadoop-CL2)#
```
19.7.4.7  monitor hadoop

The monitor hadoop command places the switch in monitor-hadoop configuration mode for configuring MapReduce Tracer monitors. A MapReduce Tracer monitor interacts with Hadoop cluster nodes that are directly attached to the switch. Tasks that the switch can perform through this interaction include:

- compile a list of nodes in the cluster.
- compile a list of jobs the nodes are running.
- download progress of the running jobs.

Monitor-hadoop configuration mode is not a group change mode; running-config is changed immediately upon entering commands. Exiting monitor-hadoop configuration mode does not affect running-config. The exit command returns the switch to global configuration mode. MapReduce Tracer is enabled in monitor-hadoop mode through the no version of the shutdown (Monitor Hadoop Cluster) command.

The no monitor hadoop and default monitor hadoop commands delete previously configured monitor hadoop mode configuration commands.

Command Mode
Global Configuration

Command Syntax

monitor hadoop
no monitor hadoop
default monitor hadoop

Commands Available in Monitor-hadoop Configuration Mode

- cluster (Monitor Hadoop)
- shutdown (Monitor Hadoop Cluster)

Examples

- These commands place the switch in monitor-hadoop configuration mode.
  
  switch(config)#monitor hadoop
  switch(config-monitor-hadoop)#

- This command exits monitor-hadoop mode.
  
  switch(config-monitor-hadoop)#exit
  switch(config)#

- This command deletes all previously configured monitor-hadoop configuration mode commands.
  
  switch(config)#no monitor hadoop
  switch(config)#
19.7.4.8  show agent oom scores

The show agent [ <agentName> ] oom scores command displays information for each agent if specified.

Command Mode
EXEC

Command Syntax
show agent [agentName] oom scores

Parameters
• Display Values
  • Agent name Name(s) of agent(s) - processes.
  • RssAnon Size of the resident anonymous memory for the given process.
  • VmSize Current total virtual memory size for the process.
  • Max VmSize Peak value of total virtual memory for the process.
  • oom_score Parameter used in determining which process to hold down.
  • oom_score_adj Parameter used to adjust oom_score.

This command displays the information for SNMP and Sysdb.

<table>
<thead>
<tr>
<th>Agent Name</th>
<th>RssAnon</th>
<th>VmSize</th>
<th>Max VmSize</th>
<th>oom_score</th>
<th>oom_score_adj</th>
</tr>
</thead>
<tbody>
<tr>
<td>Snmp</td>

<td>536.1MB</td>
<td>541.9MB</td>
<td>911</td>
<td>900</td>
</tr>
<tr>
<td>Sysdb</td>
<td>102.3MB</td>
<td>597.5MB</td>
<td>597.5MB</td>
<td>0</td>
<td>-500</td>
</tr>
</tbody>
</table>
19.7.4.9  **show monitor hadoop cluster all**

The **show monitor hadoop cluster all** command displays configuration and connection information for all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster all
```

**Example**

This command displays configuration and connection data for all connected Hadoop clusters.

```
switch>show monitor hadoop cluster all

Total number of clusters configured: 3
Cluster                     : Cluster0
  Admin status                : Enabled
  JobTracker host             : host0

```
19.7.4.10  show monitor hadoop cluster counters

The `show monitor hadoop cluster counters` command displays a list of jobs running on the specified Hadoop cluster and data consumption associated with these jobs.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop cluster c_name counters`

**Parameters**

- `c_name`  Cluster name.

**Example**

This command displays jobs running on cluster *Cluster0*.

```
switch>show monitor hadoop cluster Cluster0 counters
Last updated: 2013-10-06 18:14:23
Counters for currently running jobs on cluster: Cluster0
JobId   Job Name          User Bytes In Bytes   Out Start  Time
------- ----------------- ---------- ---------- ----------- -------------------
2       ShortName2        JobUser2   37.36GB    76.29MB     2013-10-06 17:37:43
1       ReallyAVeryLon\gNameForAJob1  JobUser1   37.36GB    76.29MB     2013-10-06 17:56:03
```

```
switch>
```
show monitor hadoop cluster history jobs

The `show monitor hadoop cluster history jobs` command displays data about the specified job. Hadoop jobs are identified by job number and the cluster that ran the job.

Data that the command returns include job identifiers, JobTracker ID, start and stop times, and data consumption.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name history jobs job_number
```

**Parameters**

- `c_name`  Cluster name.
- `job_number`  Job number. Value ranges from 0 to 2147483647.

**Example**

This command displays information about job 1 that ran on cluster `Cluster0`.

```
switch>show monitor hadoop cluster Cluster0 history job 1
Job history data for job: HistoryJob1
  Cluster       : Cluster0
  Job Id        : 1
  JT Id         : 201310110013
  User          : HistoryUser1
  Job start time: 2013-10-06 17:57:43
  Job end time  : 2013-10-08 00:31:03

Per Interface job counters:
  Interface    TaskTracker    Bytes In    Bytes Out
  ------------- --------------- ----------- -----------
  Ethernet7    TaskTracker2   26.08GB     13.04GB

switch>
```
19.7.4.12  show monitor hadoop cluster history

The `show monitor hadoop cluster history` command displays all jobs that ran on the specified cluster. The list includes all jobs that ran since the switch was reloaded, the job history was cleared (`clear monitor hadoop job-history`), or MapReduce Tracer was enabled.

**Command Mode**
EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name history
```

**Parameters**
- `c_name` Cluster name.

**Example**

This command displays the jobs that were ran on the cluster named `Cluster0`.

```
switch>show monitor hadoop cluster Cluster0 history

Jobs history on cluster: Cluster0
JobId Job Name           Start Time    End Time       Bytes In     Bytes Out
-------- ------------------ ------------- -------------- ------------ ---------
2        AReallyBigHist\oricalJobName 2013-10-06    2013-10-09     26.08GB      13.04GB
          17:41:03      06:47:43
2        AReallyBigHist\oricalJobName 2013-10-06    2013-10-09     26.08GB      13.04GB
          17:41:03      06:47:43
1        HistoryJob1        2013-10-06    2013-10-08     26.08GB      13.04GB
          17:57:43      00:31:03

switch>
```
19.7.4.13  show monitor hadoop cluster jobs counter

The show monitor hadoop cluster jobs counter command displays data consumption and progress statistics for the specified job.

Command Mode

EXEC

Command Syntax

show monitor hadoop cluster c_name [jobs job_number] counter

Parameters

• c_name   Cluster name.
• job_number   Job number. Value ranges from 0 to 2147483647.

Example

This command displays byte counters for the job named 1 that is running on the cluster named Cluster0.

```
switch>show monitor hadoop cluster Cluster0 jobs 1 counters
Last updated: 2013-10-06 18:14:23

```

switch>
19.7.4.14  show monitor hadoop cluster jobs <job number>

The `show monitor hadoop cluster jobs <job number>` command displays information about the specified job. Hadoop jobs are identified by job ID and the cluster that is running the job.

Data that the command returns include time of update, job identifiers, start times, data consumption, and completion progress.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop cluster c_name [jobs job_number]`

**Parameters**

- `c_name` Cluster name.
- `job_number` Job number. Value ranges from 0 to 2147483647.

**Example**

This command displays information about job 1 that is running on cluster `Cluster0`.

```
switch> show monitor hadoop cluster Cluster0 jobs 1
```

  TaskTracker HTTP port : 8800
  Operational status : Enabled
  Active TaskTrackers : 31
  Blacklisted TaskTrackers : 1
  Decommissioned TaskTrackers : 1
  Tracker expiry interval : 20.0
  Map slots (used/total) : 10/100
  Reduce slots (used/total) : 11/110
  JobTracker heap size : 1.04GB (max: 2.08GB)

switch>
```
19.7.4.17  show monitor hadoop cluster tasktracker

The `show monitor hadoop cluster tasktracker` command displays a list of TaskTrackers in the specified cluster. The IP address and access interface is included in the table.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop cluster c_name tasktracker`

**Parameters**

- `c_name`  Cluster name.

**Example**

This command displays the TaskTrackers on the `Cluster0` cluster.

```
switch>show monitor hadoop cluster Cluster0 tasktracker
Last updated: 2013-10-06 18:14:23
Total 2 TaskTrackers on cluster Cluster0:
Node          IP Address   Interface      Maps   Reduces
------------- ------------ -------------- ------ -------
TaskTracker1   10.100.0.1   Ethernet7      4      0
TaskTracker2   10.100.0.2   Port-Channel7  4      0
```

switch>
19.7.4.18  show monitor hadoop counters

The `show monitor hadoop counters` command displays byte counter data for all jobs running on clusters for which MapReduce Tracer is configured.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop counters`

**Example**

This command displays byte counter data for all jobs running on clusters that the switch is accessing through MapReduce Tracer.

```
switch> show monitor hadoop counters
Last updated: 2013-10-06 18:14:23
Counters for running jobs:
JobId  Job Name          Cluster    Bytes In   Bytes Out   Start Time

switch>
```
19.7.4.20  show monitor hadoop status

The `show monitor hadoop status` command displays system status for MapReduce Tracer.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop status`

**Example**

This command displays MapReduce Tracer status for all connected clusters and TaskTrackers.

```
switch> show monitor hadoop status
Last updated: 2013-10-06 18:14:23
Mapreduce Tracer status:
    Admin status                   : Enabled
    Operational status             : Enabled
    Number of clusters configured  : 3
    Number of local TaskTrackers   : 4
    Number of jobs running locally : 4
```

switch>
show monitor hadoop tasktracker all counters

The `show monitor hadoop tasktracker all counters` command displays byte counters for the TaskTrackers of all monitored Hadoop clusters.

**Command Mode**
EXEC

**Command Syntax**
`show monitor hadoop tasktracker all counters`

**Example**
This command displays byte counter data for the TaskTrackers servicing all MapReduce Tracer Hadoop clusters.

```
switch>show monitor hadoop tasktracker all counters
Last updated: 2013-10-06 18:14:23
Counters for all TaskTrackers:

19.7.4.24  show monitor hadoop tasktracker jobs

The `show monitor hadoop tasktracker jobs` command displays data about the jobs that are running on TaskTrackers located on the specified node or accessed through the listed interfaces. Including a cluster parameter filters results to include data only from the cluster polled by the specified monitor.

Command Mode
EXEC

Command Syntax
```
show monitor hadoop tasktracker NODES jobs [CLUSTERS]
```

Parameters
- **NODES**  TaskTracker node access point. Options include:
  - `host hostname`  Node name.
  - `interface ethernet e_range`  Ethernet interfaces through which node connects.
  - `interface port-channel p_range`  Port channel interfaces through which node connects.
- **CLUSTERS**  Hadoop cluster for which command displays data. Options include:
  - `<no parameter>`  TaskTracker on specified NODE can be in any cluster.
  - `cluster c_name`  TaskCluster on specified NODE must be in named cluster.

Examples
- This command displays data for jobs running on TaskTracker1.
```
switch> show monitor hadoop tasktracker host TaskTracker1 jobs
Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker1
JobId   Job Name         Cluster   Maps(#/%)  Reduces(#/%)   Start Time
------- ---------------- --------- ---------- -------------- -------------------
1      ReallyAVeryLon\ gNameForAJob1  Cluster0  2/12.34%   0/13.45%       2013-10-06 17:56:03
2      ShortName2       Cluster0  2/24.68%   0/26.90%       2013-10-06 17:37:43
```

- This command displays data for jobs on TaskTrackers accessed through Ethernet interfaces 7 and 8.
```
switch> show monitor hadoop tasktracker interface Ethernet 7,8 jobs
Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker3
JobId   Job Name         Cluster   Maps(#/%)  Reduces(#/%)   Start Time
------- ---------------- --------- ---------- -------------- -------------------
510001  ReallyAVeryLon\ gNameForAJob11  Cluster1  2/12.34%   0/13.45%      2013-10-06 17:56:03
510002  ShortName12      Cluster1  2/24.68%   0/26.90%      2013-10-06 17:37:43
```

- This command displays data for jobs on TaskTrackers accessed through Ethernet interface 7.
```
switch> show monitor hadoop tasktracker interface Port-Channel 7 jobs
Last updated: 2013-10-06 18:14:23
Running job for TaskTracker: TaskTracker2
```

- This command displays data for jobs on TaskTrackers accessed through port channel interface 7.

19.7.4.25  show monitor hadoop tasktracker running-tasks cluster job task

The show monitor hadoop tasktracker running-tasks cluster job task command displays detailed data for the specified task.

Command Mode
EXEC

Command Syntax
show monitor hadoop tasktracker NODE [running-tasks cluster name][ job jnum ][task tnum]

Parameters

- **NODE**  TaskTracker node access point. Options include:
  - host *hostname*  Node name.
  - interface ethernet *e_range*  Ethernet interfaces through which node connects.
  - interface port-channel *p_range*  Port channel interfaces through which node connects.
  - name  Cluster name.
  - jnum  Job number. Value ranges from 0 to 2147483647.
  - tnum  Task number. Value ranges from 0 to 2147483647.

Examples

- This command displays data for task 1 of job 1 on TaskTracker1 of Cluster0.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks cluster Cluster0 job 1 task 1
Last updated: 2013-10-06 18:14:23
Task details for one task as given below:
  TaskTracker name : TaskTracker1
  Interface : 'Ethernet7'
  Cluster : Cluster0
  Job Id : 1
  Task Id : 1
  Attempt Id : 0
  Task type : Map
  Status : running
  State : running
  Start time : 2013-10-06 17:57:43
  Progress : 50.00%
  HDFS bytes read : 1.05MB
  HDFS bytes written : 1.07MB
  Reduce shuffle bytes : 1.48MB
```

- This command displays data for task 1 of job 1 on the Cluster0 TaskTracker that is accessible through Ethernet interface 7.

```
switch>show monitor hadoop tasktracker interface Ethernet 7 running-tasks cluster Cluster0 job 1 task 1
Last updated: 2013-10-06 18:14:23
Task details for one task as given below:
  TaskTracker name : TaskTracker1
  Interface : 'Ethernet7'

  HDFS bytes written : 1.07MB
  Reduce shuffle bytes : 1.48MB
```
19.7.4.26  show monitor hadoop tasktracker running-tasks

The `show monitor hadoop tasktracker running-tasks` command displays progress and byte counts of tasks executed by TaskTrackers located on the specified node or accessed through the listed interfaces.

Including a cluster-ID parameter filters results to include data only from the specified cluster.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop tasktracker NODES running-tasks [CLUSTERS][JOBS]`

**Parameters**

- **NODES**  TaskTracker node access point. Options include:
  - `host hostname`  Node name.
  - `interface ethernet e_range`  Ethernet interfaces through which node connects.
  - `interface port-channel p_range`  Port channel interfaces through which node connects.
- **CLUSTERS**  Hadoop cluster for which command displays data. Options include:
  - `<no parameter>`  TaskTracker on specified NODE can be in any cluster.
  - `cluster c_name`  TaskTracker on specified NODE must be in named cluster.
- **JOBS**  Job list. Options include:
  - `<no parameter>`  all jobs.
  - `job <0 to 2147483647>`  Specifies number of single job.

**Examples**

- This command displays data for tasks running on TaskTracker named *TaskTracker1*.

```
switch>show monitor hadoop tasktracker host TaskTracker1 running-tasks
Last updated: 2013-10-06 18:14:23

switch>
19.7.4.27  show monitor hadoop tasktracker status

The `show monitor hadoop tasktracker status` command displays connection and activity information for the TaskTracker on the specified clusters or accessed through the specified interface. The following command formats display the listed TaskTracker information:

- `show monitor hadoop cluster c_name tasktracker status`: TaskTrackers on specified cluster.
- `show monitor hadoop tasktracker node status`: TaskTrackers on specified nodes or interfaces.
- `show monitor hadoop tasktracker all status`: all connected TaskTrackers.

**Command Mode**

EXEC

**Command Syntax**

```
show monitor hadoop cluster c_name tasktracker status
show monitor hadoop tasktracker NODES status
show monitor hadoop tasktracker all status
```

**Parameters**

- `c_name`  Cluster name.
- `NODES` TaskTracker node access point. Options include:
  - `host hostname`  Node name.
  - `interface ethernet e_range`  Ethernet interfaces through which node connects.
  - `interface port-channel p_range`  Port channel interfaces through which node connects.

**Examples**

- This command displays connection and activity information for all TaskTrackers connected through Ethernet interfaces 7 and 8.

```
switch>show monitor hadoop tasktracker interface Ethernet7,8 status

switch>
19.7.4.28 show monitor hadoop traffic burst

The `show monitor hadoop traffic burst` command displays the largest data bursts for specified Hadoop cluster jobs. A data burst is the data consumed during a polling interval. The command displays input and output burst:

- Input bursts include bytes written to the host.
- Output bursts include bytes written by the host.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop [CLUSTERS] traffic burst [NODE]`

**Parameters**

- **CLUSTERS** Hadoop clusters for which command displays data. Options include:
  - `<no parameter>` All clusters.
  - `cluster c_name` Cluster name.
- **NODES** TaskTracker node access point. Options include:
  - `host hostname` Node name.
  - `interface ethernet e_range` Ethernet interfaces through which node connects.
  - `interface port-channel p_range` Port channel interfaces through which node connects.

**Examples**

- This command displays traffic burst data for all running jobs.

```
switch>show monitor hadoop traffic burst

Visibility and Monitoring Services

This command displays traffic burst for all jobs running on TaskTrackers that are accessible through Ethernet interfaces 7 and 8.

```
switch> show monitor hadoop traffic burst interface Ethernet 7,8

switch>
19.7.4.29 show monitor hadoop

The `show monitor hadoop` command displays a list of jobs that are running on all monitored Hadoop clusters.

**Command Mode**

EXEC

**Command Syntax**

`show monitor hadoop`

**Example**

This command displays the jobs that are running on all monitored clusters.

```
switch> show monitor hadoop
Last updated: 2013-10-06 18:14:23
Currently running jobs: 4
JobId  Job Name         Cluster   Maps(#/%)  Reduces(#/%)  Start Time
-----  ---------------- --------- ---------- ------------- -------------------

switch>
```
19.7.4.30  show monitor system

The `show monitor system` command displays information about the memory usage status of the system including when low-memory situations have led to out-of-memory (OOM) events.

Command Mode

EXEC

Command Syntax

```
show monitor system
```

Command displays the information for the current state of the system.

Parameters

- `<no parameter>` state of the system.

<table>

</tbody>
</table>
19.7.4.31 shutdown (Monitor Hadoop Cluster)

The `shutdown` command disables MapReduce Tracer for the configuration mode cluster. Globally disabling MapReduce Tracer (show monitor hadoop) also disables the function on the individual cluster. Enabling MapReduce Tracer for the cluster requires the function to be enabled globally and for the individual cluster.

The `no shutdown` command configures the MapReduce Tracer setting as enabled for the configuration mode cluster. The `shutdown` and `default shutdown` commands disable MapReduce Tracer for the cluster by removing the corresponding `no shutdown` command from `running-config`.

Command Mode

Monitor-hadoop-cluster Configuration

Command Syntax

```
shutdown
no shutdown
default shutdown
```

Related Commands

- `cluster (Monitor Hadoop)` places the switch in monitor-hadoop-cluster configuration mode.

Example

- These commands globally enable MapReduce Tracer, then enables it for the `CL2` cluster.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#no shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
cluster CL2
  no shutdown
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
cluster CL2
  no shutdown
switch(config-monitor-hadoop-CL2)#
```

- These commands disable MapReduce Tracer for the `CL2` cluster. MapReduce Tracer remains globally enabled.

```
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#shutdown
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
cluster CL2
switch(config-monitor-hadoop-CL2)#exit
switch(config-monitor-hadoop)#show active
monitor hadoop
cluster CL2
  no shutdown
switch(config-monitor-hadoop-CL2)#
```
19.7.4.32 shutdown (Monitor-Hadoop)

The `shutdown` command globally disabled MapReduce Tracer on the switch. Enabling MapReduce Tracer for an individual cluster requires the feature to be globally enabled through this command and enabled for the individual cluster thorough the `shutdown (Monitor Hadoop Cluster)` command. By default, MapReduce Tracer is globally disabled.

The `no shutdown` command globally enables MapReduce Tracer. The `shutdown` and `default shutdown` commands globally disable MapReduce Tracer by removing the corresponding `no shutdown` command from `running-config`.

**Command Mode**
Monitor-hadoop Configuration

**Command Syntax**
```
shutdown
no shutdown
default shutdown
```

**Related Commands**
- `monitor hadoop` places the switch in monitor-hadoop configuration mode.

**Examples**
- These commands globally enable MapReduce Tracer.
  ```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#no shutdown
switch(config-monitor-hadoop)#show active
   monitor hadoop
   no shutdown
switch(config-monitor-hadoop)#
  ```
- This command globally disables MapReduce Tracer.
  ```
switch(config-monitor-hadoop)#shutdown
switch(config-monitor-hadoop)#show active
switch(config-monitor-hadoop)#
  ```
19.7.4.33  tasktracker (Monitor Hadoop Cluster)

The tasktracker command specifies the HTTP port for accessing TaskTrackers of the Hadoop cluster monitored through configuration mode statements. The switch compiles a list of the cluster’s TaskTracker addresses by periodically polling the cluster’s JobTracker (jobtracker (Monitor Hadoop Cluster)). The default TaskTracker HTTP port is 50060.

The no tasktracker and default tasktracker commands restore the configuration mode TaskTracker HTTP port to 50060 by removing the corresponding tasktracker command from running-config.

Command Mode
Monitor-hadoop-cluster Configuration

Command Syntax

```
tasktracker http-port port_number
no tasktracker http-port
default tasktracker http-port
```

Parameters

- **port_num**  TaskTracker HTTP port number. Value ranges from 1 to 65535. Default value is 50060.

Related Commands

- cluster (Monitor Hadoop) places the switch in monitor-hadoop-cluster configuration mode.

Examples

- These commands specify a TaskTracker HTTP port address of 51000.

```
switch(config)#monitor hadoop
switch(config-monitor-hadoop)#cluster CL2
switch(config-monitor-hadoop-CL2)#tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
cluster CL2
    tasktracker http-port 51000
switch(config-monitor-hadoop-CL2)#
```

- These commands restore the default TaskTracker HTTP port address of 50060.

```
switch(config-monitor-hadoop-CL2)#no tasktracker http-port
switch(config-monitor-hadoop-CL2)#show active
monitor hadoop
    cluster CL2
switch(config-monitor-hadoop-CL2)#show active all
monitor hadoop
    cluster CL2
        jobtracker rpc-port 8021
tasktracker http-port 50060
    interval 10
    shutdown
switch(config-monitor-hadoop-CL2)#
```
